Chronic DP shortcomings on the wane?

By John Gallant
CW Staff

NEW YORK — A growing trend toward professionalism in the ranks of programmer staffing and management could lay to rest the ghosts of poor quality and low productivity that haunt many software development houses today.

That sentiment is the core of a recently released study undertaken by the Diebold Research Program of the Diebold Group, Inc., located here. The study, according to Director of Research Services David Dell, was conducted as part of Diebold's ongoing MIS-oriented research program. It involved interviews with leading software vendors, industry analysts and DP managers within 120 U.S. companies and an equal number of international corporations. Dell characterized the firms as Fortune 500 corporations with MIS budgets ranging from $30 million to $70 million.

The Diebold study opened by stating that programming is currently "labor-intensive, difficult to manage and expensive . . . [and] often leads to a product that is functionally deficient, unreliable and difficult to maintain." Thus, the study continued, it is not surprising that the programming community is widely considered to be inadequate in delivering usable, reliable programs; forecasting costs, resources and schedules; and achieving productivity rates "even close to being economically justifiable."

"Today, programmers are not highly professional, and neither the act of programming nor the methods for its management are well-defined," the Diebold study concluded.

EDS reassures workers

Service firm says it will not drop GM's use of contract DP employees for at least a year

By John Gallant
CW Staff

DETROIT — The jobs of some 3,000 independent contract workers within General Motors Corp.'s U.S. computer and communications facilities appear secure — for at least the near future — in the wake of the auto giant's transfer of DP responsibilities to Electronic Data Systems Corp.

EDS became a wholly owned subsidiary of GM following stockholder approval last month of the automaker's $2.5 billion takeover of the Dallas-based computer services company [CW, Oct. 1, Oct. 22].

EDS officials told *Computerworld* last week that DP contract workers currently supplied to GM by more than 130 different personnel agencies would remain in their present jobs for at least one year — despite fears that EDS intended to end GM's reliance on contract workers quickly.

According to Ken Riedlinger, senior vice-president with EDS and a member of its board of directors, GM currently employs at least 3,000 contractors in a wide variety of DP positions. The contractors are in addition to the more than 10,000 full-time GM DP employees who will officially become EDS employees Jan. 1 (see story page 9). He said the contractors will gradually be replaced as EDS hires and trains new employees.

While Riedlinger's statement appeared to sound a death knell for the current crop of GM contractors, he told *Computerworld* that his company intends to hire as a full-time EDS employee any contractor

High-tech nomads find job-shopper lifestyle rewarding

By David Olmos
CW Staff

Charles Fahnestock has worked as an electronics technician for 18 years, but he has seldom held a steady job. In the past eight years alone, he has journeyed to Massachusetts, New Mexico, Michigan, California, Colorado, Connecticut and Vermont for employment.

But there is nothing involuntary about Fahnestock's nomadic work life. It is not the result of a tight job market, a bad employment record or job dissatisfaction. It is a matter of personal choice.

Fahnestock, a printed-circuit board designer and computer-aided design and manufacturing system operator, is part of an important subculture of workers spawned by the computer industry. They are engineers, programmers and other technicians who work as temporary employees at a series of firms. Their jobs can last for several months or, in some cases, several years.

"It takes a certain breed of person to be able to do this," said Fahnestock, who, with his wife Joyce, travels from job to job in a 35-foot trailer that doubles as their home.

Nixdorf's 8890 additions boast larger memory

WALTHAM, Mass. — Nixdorf Computer Corp. last week expanded its 8890 line of IBM 4300-series-compatible processors with four models that are said to accommodate more main memory and peripherals than older 8890 CPUs. At the same time, the company unveiled the 8890/CP, a turnkey communications processor designed for use in distributed processing and networking applications.

The newly announced 8890 processors are the Models 12, 32, 52 and 72. A spokeswoman said the company still plans to manufacture and market the original four 8890 models — the 10, 30, 50 and 70 — but said that the company will probably phase the older systems out of the lineup over time. Currently, all eight

Micro makes veterans' day

Alabama data base expected to go nationwide by year's end

By Edward Warner
CW Staff

MONTGOMERY, Ala. — While many across the nation celebrated Veteran's Day with a holiday from work this week, hundreds of veterans in this state may have a computerized data base to thank for the fact that they have jobs.

By December, U.S. Labor Department officials expect the Alabama data base to be in nationwide service as well.

The data base, the Computerized Federal Contractor Awards Information System (CFCAIS), stores the U.S. Commerce Department's list of all businesses to receive federal contracts in Alabama and informs the Alabama Job Service, the state's job-finding agency, whenever a new federal contract is available there. A federal contract carries with it the requirement that the contractor attempt to hire Vietnam veterans or those with service-related disabilities. Alabama Job Service employees visit contractors shortly after the contract is announced to help them find suitable veterans to hire.

Before the CFCAIS came into use, state job finders in Alabama and all other states received notice of new federal contracts in their areas on a quarterly basis, causing long delays before the state could make its hire-a-vet pitch to the employer, said James C. Gates, state director for veterans employment and training. There were even instances, Gates said, where contracts were completed before the state job finders learned of them.

In the 12 months since the data base came into use in Alabama, state Job Service employees have been able to place 2,500 more veterans than the year before, Gates said, adding that "I have a feeling that this program gave some impetus to that [improvement]." The state, he said, places 12,000 to 13,000 veterans in jobs each year.

Last month, the U.S. Labor Department gave $24,950 to the Alabama Department of Industrial Relations, which operates the CFCAIS, to enable it to bring the data base into nationwide use in a pilot project.

Upgrading the system for national use will require purchasing a new microcomputer with 20M bytes of storage capacity — probably an IBM Personal Computer XT — said Alabama state labor official Frank Willet. Also needed, Willet added, will be a dot matrix printer similar to the Epson America, Inc. FT-100 and a copy of Lotus Development Corp.'s Symphony integrated software package to tie it all together.

The data base is currently housed on an Addressograph-Multigraph Corp. AM 425 word processing system, a unit that incorporates a letter-quality printer that is used to generate the congratulatory form letters that the state sends to those who receive federal contracts in Alabama. The letters will not become part of the national system, however.

By December, Gates said, the CFCAIS will begin sending a weekly list of businesses within each state which have received federal contracts. The states will, in turn, refer the names to the Job Service office in the area where the firm is located. The employers will then be contacted and offered the opportunity to hire veterans, according to Gates.

Using a Hayes Computer Products, Inc. Smartmodem, CFCAIS each day downloads the department's daily list of new federal contracts onto a diskette on the AM 425 from the computers of the Commerce Department.

The congratulatory letters it sends to new federal contractors also remind the contractor of the Veterans Readjustment Assistance Act, which mandates that they make an effort to hire Vietnam veterans and tells them to expect a call from a local Job Service representative. A copy of the letter, Gates explained, is sent to the local Alabama Job Service office.

STC revamps management, inks pact

LOUISVILLE, Colo. — Storage Technology Corp. (STC), which two weeks ago filed for bankruptcy protection [CW, Nov. 5], announced last week a management reorganization and a pact with Chemical Bank for a $150 million line of credit that the company said will enable it to "move forward" under Chapter 11 of the Federal Bankruptcy Act reorganization.

Naim S. Aweida, brother of Chairman and Chief Executive Officer Jesse I. Aweida, announced his resignation as president and chief operating officer. Aweida's resignation had been speculated for some time, and the firm reportedly had been actively seeking a new president. STC said Jesse Aweida would assume the duties of chief operating officer; no one was named president.

In other changes, the company announced Howard Derby was promoted from vice-president of field engineering to vice-president of field operations, in charge of all sales and field engineering activities; company cofounder and Executive Vice-President Zoltan Herger was placed in charge of the company's optical storage business unit; and Sewell Sleek, formerly vice-president in charge of the storage tape division, was named acting head of engineering and manufacturing operations.

The line of credit from Chemical Bank is subject to court approval and would give Chemical a "superpriority" claim status under bankruptcy regulations, which would place Chemical ahead of STC's unsecured creditors. STC owes more than $200 million to unsecured creditors.

CORRECTIONS

The Nickels and Dimes column in the Computer Industry section [CW, Sept. 17] incorrectly attributed a third-quarter earnings report to Science Management Corp. Science Management recently reported second-quarter revenues of $16.7 million, up 28% over the previous year, and a net loss of $1.1 million, or 43 cents per share, compared with a year-earlier loss of $175,000, or 9 cents per share.

The purchase price for Computer Consoles, Inc. (CCI) Timelaw in Law Office-power software was incorrectly stated [CW, Oct. 15]. For the CCI Power 6/32 superminicomputer, the Timelaw package costs $50,000, and to run on the CCI Power 5/20 and Power 5/30 machines, the Timelaw software is priced at $30,000.

Hot line seeks hot tips

Hard as we try to give our readers the most complete information available, some good news and feature stories never reach us.

Are you involved in an unusual application of DP technology? Have you implemented successful cost-cutting strategies? Is something in your DP shop not working as designed? Know any unsung heroes? Heard any hot news about vendors? Are you aware of technology or management trends the trade press is overlooking?

Computerworld has established a reader hot line for information regarding items of interest to the computing community. Call us toll free at (800) [illegible]. Ask for Donovan White, assistant managing editor.

ADR® WARE™

ADR/ROSCOE®, VOLLIE®, THE LIBRARIAN®

Examples of ADR's ability to design software with a future.

In an industry where few products are expected to have a long, useful life, one software company has consistently produced products with staying power. ADR.

Cases in point: ADR's ROSCOE, VOLLIE and The LIBRARIAN. ROSCOE and VOLLIE for on-line programming in the MVS and DOS/VSE environments. The LIBRARIAN for source program management control in virtually any on-line programming environment. VOLLIE was introduced over 8 years ago. ROSCOE and The LIBRARIAN have been in use for over 15 years. And although it may seem incredible, all three are still operating at peak efficiency for the over 10,000 installations that rely on them every day.

Because, and equally incredible, ROSCOE, VOLLIE and The LIBRARIAN are still considered state of the art today. Why? The fact is, ADR will not allow its software to become outdated. ADR software is constantly updated, so far at a cost of over $50 million over the years for ROSCOE, VOLLIE and The LIBRARIAN alone.

The LIBRARIAN has undergone 5 major rewrites since its introduction. ROSCOE and VOLLIE have undergone similar changes. Simply put, ADR doesn't believe in obsolescence. And if your software doesn't become obsolete, neither will your applications.

And when IBM introduces a new operating environment, program conversions arent far behind. For example, when IBM changed its TSO-SPF architecture, it took 15 minutes to get The LIBRARIAN to work with it. And that was done over the phone.

ADR designs software that does more than interface. ADR software integrates. Each piece of ADR software builds on and enhances the performance of the others.

And nobody's products outperform ADR's on-line productivity products. Not even IBM's. The simple fact is that ADR software uses less of your computer's resources. For example, with ROSCOE, after the first terminals sign on, each additional terminal takes approximately an extra 35K of virtual memory. According to IBM's recommendation, with their TSO/ISPF, the same expansion uses an extra 2,000K.

ROSCOE also provides for a quick response time. And when your computer's response time is quicker, application development and maintenance go quicker. So your programmers produce more. And increased productivity helps solve the major problem facing data processing today – the application backlog.

When you use ADR software you can be sure you're using software that performs and will continue to perform.

So next time you're considering a new software product from someone else, ask to take a look at some of their old products. If they're still around.

Then call 1-800-ADR-WARE or mail us the coupon and learn more about the software that can help your computers do everything they promised.

Before you make a software decision mail in the coupon below. Or call in N.J. (201) 874-9000 or toll free 1-800-ADR-WARE

Sears to fuse private lines into unified net

Major communications project to incorporate cost-effective integration of voice and data

By John Dix
CW Staff

ARLINGTON HEIGHTS, Ill. — Sears, Roebuck & Co. is undertaking an ambitious feat: integrating the separate private-line data communications networks operated by its five business groups into a monolithic net that will also, where cost-effective, integrate voice and data.

Today, individual private-line networks are maintained by Sears Merchandise Group, the retail and catalog merchant; Allstate Insurance Group; Dean Witter Reynolds, Inc., a brokerage and financial services company; Coldwell Banker, a commercial and residential real estate firm; and Sears World Trade, which is involved in international merchandise trade.

In Februrary 1983, the corporation formed Sears Communications Network, Inc., a business unit whose basic mission is to integrate the networks of these companies to lower operating expenses and provide for new services. Eventually the centralized organization will supply the five business groups with all of their voice and data communications needs, including planning, coordination and support.

Integration in perspective

To put the integration effort into perspective, consider that next year the combined annual communications budget for the Sears' units will be more than $300 million, according to the best estimates of Gerard R. Weis, director of data communications.

To use that budget most efficiently, the five networks will be pulled together to remove overlapping geographical coverage. "There are probably one or more Sears stores, one or more Allstate offices and one or more Dean Witter Reynolds offices in any given metropolitan area," Weis explained.

Addressing the data communications objectives of the project in an interview at his office here recently, Weis said the goal is to establish a backbone network through which traffic can be routed to any host processing system within the Sears family of companies.

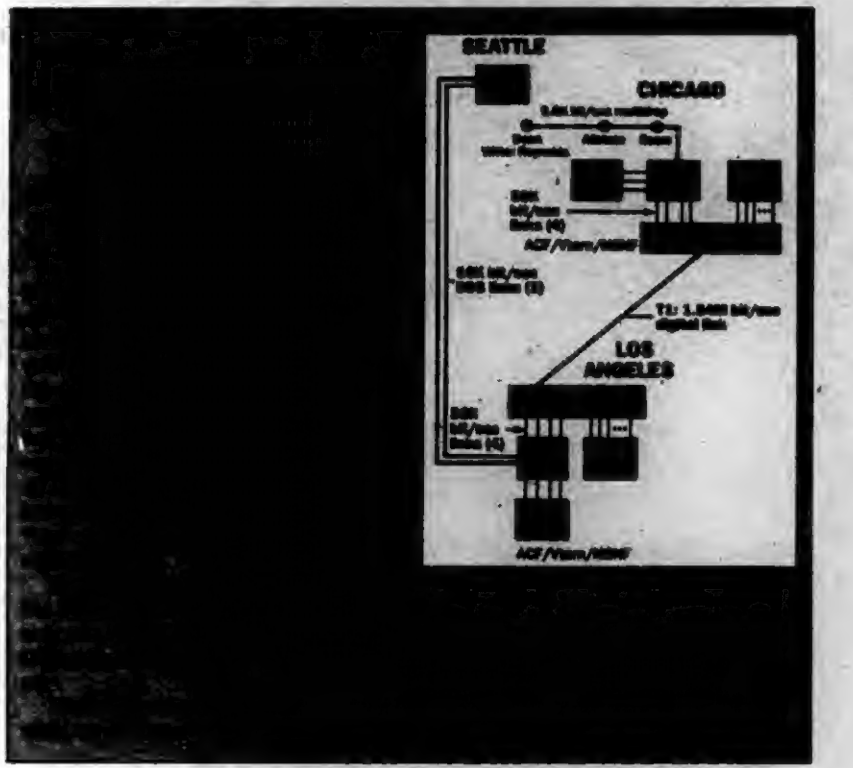
Homogeneous system

While complex and time-consuming, the integration effort will be greatly facilitated by the fact that each Sears company has IBM computer systems and networks of 3270 Binary Synchronous Communications and 3270 Synchronous Data Link Control (SDLC) terminals. Given the homogeneity of the products, the decision to go with IBM's System Network Architecture for the integrated network was straightforward, Weis said.

The network will slowly migrate to pure SDLC support because it provides for the greatest degree of facility sharing, he noted.

The integrated network will actually be a beefed-up version of the net presently serving the Sears Merchandise Group. This is the largest network in the company, used to support over 1,000 Sears stores. Six months ago Sears Communications began enhancing the net and adding additional IBM 3725 communications processors to it. Later this year the other networks will be merged with this network, a process that will extend into 1986.

Essentially, the backbone network will consist of 3725s strategically located throughout the country, connected by high-capacity lines, such as AT&T 56K bit/sec Digital Dataphone Service circuits or 1.54M bit/sec T1 digital facilities.



Facility type depends on traffic volume

The type of facilities used for the point-to-point links between 3725s will depend on the traffic volume between those points. "A 3725 located in Seattle," Weis noted, "may not require a T1-type facility, and we'll use multiple 56K bit/sec links for that. Other routes, such as between Chicago and Los Angeles, will be naturals for T1."

There isn't enough data traffic anywhere in the network to require a direct T1 interface to a 3725, the director said. Use of these high-bandwidth facilities is dependent on the coexistence of voice traffic. "We have been calculating the aggregate capacity coming out of data and PBX equipment at a unit level and figuring out how we can most cost-effectively meet the bandwidth needs," Weis explained.

The company is "not [architecturally] tied in to T1 in any way," he clarified. "We can use it where it's cost-effective or use 56K bit/sec digital facilities. This isn't a decision you can make once and not continue to look at. It depends on traffic analysis and tariffs."

Users can access any host in net

When completed, terminal users will be able to access any host processor in the integrated network through the 3725s, according to Weis.

"There is no channelization of the bandwidth that makes that happen. The terminal can logically connect, by entering a logon command, to CICS in any host in the network where [the user] has authorization to do so." The Network Control Program in the 3725s establishes and controls the host sessions.

The biggest challenge in this Herculean undertaking, according to Weis, is understanding the requirements of the different business groups served. "We are not here to put together a network and then go out and convince people that they ought to use it. It's the other way around. Our mission is to understand what they need and then go out and engineer and build it."

Sears' ambitious network plans won't carry into office

By John Dix
CW Staff

As up-to-the-minute as Sears, Roebuck & Co.'s wide-area networking plans are, within the office, the company sees little need to adopt the communications technologies currently in vogue. It uses its telephone systems to switch calls, not data. Local networks do not give it goose bumps. And it does not have any plans to replace its terminals with personal computers.

While planning to integrate voice and data where cost-effective in the backbone network — which is being constructed by combining the five private-line networks currently operated by the Sears companies — that integration will not be extended into the office, according to Gerard R. Weis, director of data communications.

This means private branch exchanges (PBX) will not be used to support data devices. "In our case, the bulk of the data traffic is flowing through dedicated [IBM 3270] controllers; hence we haven't been very interested in hanging terminals off of PBXs," Weis said. "We don't do that at all; we just haven't had the need."

The preponderance of host-connected 3270-type displays also obviates the need for local-area networks, the director indicated. Although each of the five Sears' business groups makes its own decisions regarding local nets, Weis said he has not seen a rush to the technology. "For a business group that has a lot of 3270s, there is no obvious reason that it would want to install a local network," he said.

Weis

CW photo by J. Dix

Local networks will become more pervasive as the number of personal computers within the organization increases, Weis said. But the justification for these computers is based on applications rather than just as a replacement for terminals. There has not been a "wholesale migration away from fixed-function 3270s to personal computers," he clarified. To accommodate the few users who want to swap their 3270s for personal computers and still be able to access the network, Weis' group has published standards that specify the type of device the micro computers must emulate.

While Sears currently has little need for local networks, the company is in need of a building wiring standard. The IBM Cabling System, which specifies how to wire buildings to provide data outlets in every office, seems to fit the bill. Weis said that the Cabling System "was something that we as customers — not just communications, but data processing, too — have been looking for for a long time."

Use of the Cabling System will enable Sears to wire buildings once with the assurance that it will support future products.

"Is it the best thing in the world?" Weis asked. "I don't know. Is it adequate for us to do physical planning and go off and wire new sites? Yes, it is."

Sears unit looks for network resale options

When Sears Communications Network, Inc. was formed to consolidate the private-line networks operated by the five companies within the Sears, Roebuck & Co. family, another company was formed under the group to head up a venture into the communications resale business.

Called Sears Communications Co., the basic mission of the new unit is to explore ways to resell excess corporate network capacity.

Initially, the company is focusing on reselling capacity on a satellite network serving New York, Chicago, Dallas, Atlanta, Los Angeles, San Francisco and Denver that is leased from American Satellite Co. Roy Leyton, director of marketing for the Sears Communications Co., reported that the company is already supplying dedicated voice and data channels to 34 customers through this network.

Intends to resell capacity

And while it is too early to say how, Leyton said that the company intends to resell voice and data capacity on the company's backbone network that is being built by integrating the private-line networks of the five Sears companies.

In a related matter, a group within the Sears Merchandise Group, the retail and catalog merchant, is currently involved in a test project where it is serving transaction services to Phillips Petroleum Co. in Bartlesville, Okla.

In that experiment, Sears is testing the viability of offering enhanced communications services that use its communications network and call on its transaction expertise.

WHAT DOES THIS REPORT MEAN TO YOU?

Space occupied by data sets inactive for 30 days
Savings over full volume dump

This report means that ABR puts you in control of your system whether it drives 16 or 160 disks.

WITH ABR YOU:
- Identify and free-up inactive data sets
- Save by dumping only data sets which change
- Track and recall backups automatically
- Provide the security of current backups
- Install program in minutes with a simple linkedit

SEND FOR YOUR FREE DASD MANAGEMENT REPORT PROGRAM
(Contains tape and brief easy-to-follow guide.)

The only thing more convincing than seeing your own data produced in report form with such ease and accuracy is the factual measurement data you can provide to those whom you would influence and persuade.

ABR provides an efficient and easy-to-use method of managing the space on direct access volumes, regardless of the size of your system. And this report will help you prove it.

TEMPS

from page 1

"You have to be confident . . . not a worrywart about where the next dollar is coming from. Some people have tried it and didn't like it because . . . they didn't know where their next job was going to be."

Temporary workers, or job shoppers as they call themselves, often work for temporary employment companies such as CAD/CAM Resources, Inc., a Waltham, Mass., firm that specializes in the high-technology field. Kevin Jackson, president of the company, said that because of the current boom in CAD/CAM, he has more jobs available than workers to fill them.

"It's very difficult to find these people," added Robin Shaw, owner of Temco, a two-year-old Minneapolis temporary firm, who claimed his business has increased sharply compared with last year.

Shaw and other representatives of temporary firms interviewed indicated that demand for their workers is on the rise, but there apparently are no hard statistics to support their claim. The U.S. Department of Labor does not keep statistics on the number of temporary workers employed in technical fields.

Temporary assignments offer several advantages to the worker, including higher wages. Temporaries are generally paid 20% to 40% more than permanent employees, but receive fewer fringe benefits, according to several placement firms.

Shaw said that temporaries are often hired to work on challenging product development projects. "Our people want to be where the action is," he said.

"Good people really don't like to sit on their duffs," added Tom Shaurette, president of Computerpeople, Inc., a Tampa, Fla., employment firm. "One reason temporaries are there is because something exciting is going on."

Fahnestock said, "Anyone in the engineering field likes a challenge, and when there's no challenge, it becomes ho-hum and you have a lack of interest in your work."

Jere Annis is a programmer who, 1½ years ago, quit his job as manager of a county government DP shop to work as a job shopper for Computerpeople. "The big advantage I've found is an opportunity to get exposure to different kinds of systems," Annis said. "The biggest disadvantage is having to learn the ropes in a new facility."

Temporaries said they also like not being subjected to the office politics that are sometimes a part of permanent employment.

Fahnestock cited office politics and a lack of advancement opportunities as reasons why he quit his job as an engineering aid in 1966 to try temporary work. "I was going nowhere there, and I didn't like playing kiss-up to the boss, so I left."

Shaw noted that many younger employees work temporarily to shop around for a prospective employer. "They want to have experience at different companies to see which workplace best fits their needs."

Sometimes it is the companies that do the shopping. Oftentimes, a temporary worker will be offered a permanent job if his employer likes his work and has a job opening.

Fahnestock said Martin Marietta Corp. in Denver has twice asked him to stay on as a permanent employee after his temporary assignments ended. He declined both times, but said such offers "make you feel like you've really done a super job."

Ted Widor, drafting manager for GTE Corp.'s Strategic Systems Division in Westboro, Mass., hires temporaries during peak work load times. He and other employers said temporaries allow them to adjust to work load fluctuations without worrying about laying off permanent employees when a job is completed. Such fluctuations are particularly characteristic of military-related business, they said.

"It doesn't pay to bring [permanent workers] in for a short time and then lay them off," CAD/CAM Resource's Jackson said. "It's just bad business."

While temporaries listed numerous benefits to their work, they also noted some drawbacks. "Sometimes, shoppers get into a company, and the [permanent employees] look down on them," Fahnestock said. "I guess it's because they know the shoppers are making more money than they are. They forget the shopper's job may last only six months and then he's out on the street."

The transient nature of their work lives means temporaries are often saying farewell to their coworkers.

"Some shoppers don't admit it," Fahnestock said, "but after you're on a job for awhile, it's kind of hard to leave. You build up a lot of good relationships with the people you work with. It's kind of sad."

Microsoft adds IBM-compatible network software, MS-DOS 3.1

By Eric Bender
CW Staff

BELLEVUE, Wash. — Offering personal computer networking software compatible with IBM's PC Network, Microsoft Corp. last week announced and began shipping its Microsoft Networks package and MS-DOS 3.1.

The two products — network operating software and the latest version of the nearly ubiquitous MS-DOS operating system, complete with networking hooks — will allow independent software vendors to write one version of their packages that will run on various networks, the company said last week.

According to Microsoft, most important among these networks is the PC Network. The Microsoft Networks package reportedly shares the PC Network's software application interface, while MS-DOS 3.1 corresponds to IBM's PC-DOS 3.1.

Microsoft Networks 1.0 is a software package said to implement session and presentation layers on the International Standards Organization communications model — insulating application packages from specific hardware configurations — and to contain a file and print server.

The software reportedly consists of redirector and server programs and associated utilities. The redirector program, installed on each personal computer on the network, captures local MS-DOS requests and forwards them to MS-DOS on a remote machine. The server application program reportedly runs on each network server, handling requests for data or shared peripherals.

Current MS-DOS applications will run and access network resources on a Microsoft Networks system without being rewritten, Microsoft said.

There are no physical or logical limits on the number of network nodes, Microsoft said. The supplier is working on extensions to the core network protocols to provide networking between MS-DOS and its Xenix operating system.

MS-DOS 3.1, required to support Microsoft Networks, is fully upward-compatible with MS-DOS 2.0 and 2.1, the company said. MS-DOS 3.1 reportedly provides an expanded file-naming structure that includes the name of the computer on which the file resides and manages files that are simultaneously shared among applications.

The network software announcement drew immediate support from the following system and network vendors: Digital Equipment Corp.; Zenith Data Systems; Hewlett-Packard Co.; Intel Corp.; Applied Computer Technologies; North Star Computers, Inc.; Corona Data Systems, Inc.; Corvus Systems, Inc.; 3Com Corp.; Nestar Systems, Inc.; Davong Systems, Inc.; AST Research, Inc.; Proteon Associates, Inc.; Ungermann-Bass, Inc.; Western Digital Corp.; Tecmar, Inc.; Orchid Technology, Inc.; and Interlan, Inc.

"We see it as an emerging standard, and we want to follow that standard," said Ron Kasik, director of systems software at Zenith Data Systems in Glenview, Ill.

Other vendors and analysts generally agreed that they expect widespread adoption of the network software. However, many were surprised that Microsoft Networks calls for a dedicated network server, while some pointed to other limitations.

"Microsoft Networks requires a dedicated server, and the PC Network does not," noted Craig Burton, marketing director at Novell, Inc., an Orem, Utah-based supplier of networking software. Burton said the Microsoft product also lacks "the sophisticated error recovery and the other functionality IBM put in."

Microsoft Networks "will be a big factor in getting a lot more software applications," predicted Buck Gee, president of Santa Clara, Calif.-based Software Connections, which sells network applications. However, he described it as "a minimal network operating system."

The setup requires dedicated servers because MS-DOS 3.1 is a single-tasking operating system, according to Microsoft. "Right now, a nondedicated server probably would have marginal performance," a company spokesman said. "In a multitasking environment, that issue goes away."

Microsoft is located at 10700 Northup Way, Bellevue, Wash. 98004.

Environments which are user friendly produce friendly users.
Make a friend!

How to stop the grumbling

MANAGER SOFTWARE PRODUCTS' CONTROLMANAGER™ rids your users of the never ending task of having to learn how to interact with yet another software product. It enables them to match the functionality of a software product with their specific requirements, while at the same time removing the need for them to become "system" knowledgeable.

Meet the MANAGER family

CONTROLMANAGER is truly integrated and being a member of MSP's MANAGER Family, is totally dictionary driven. CONTROLMANAGER is initially available exclusively for the other members of the MANAGER Family. These include DATAMANAGER® the data and information resource management system, DESIGNMANAGER™ the logical data base design and information modeling system and SOURCEMANAGER™ the Cobol application development system.

Interface with ease

CONTROLMANAGER is the interactive interface between the person, the machine and the software. It provides automatic navigation for the user to get where he wants to be. It is simply and logically tailorable.

Let's get together

Find out how CONTROLMANAGER can help you make friends with your users.

Send the coupon today or call (617) 863 5800 (Telex 710 326 6431).

Send me more information about MANAGER SOFTWARE PRODUCTS' family of integrated, dictionary driven products:

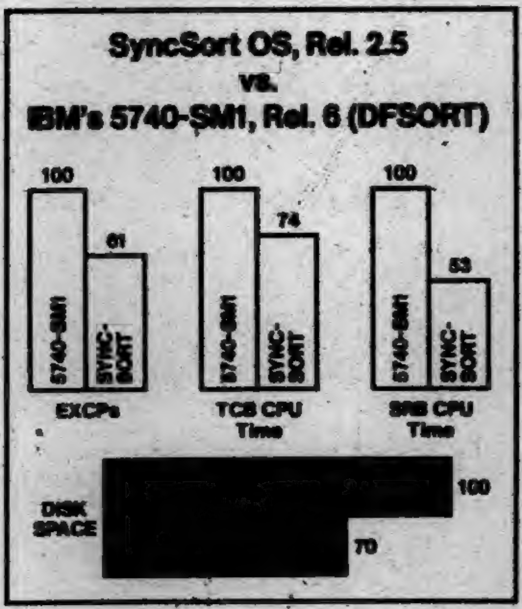
Thoroughbred

Meet the newest champion in the world's greatest sorting stable!

(SyncSort OS 2.5)

Call (201) 568-9700.

Find out why it takes a SyncSort to beat a SyncSort.



syncsort INC.

Syncsort Incorporated 560 Sylvan Ave., Englewood Cliffs, N.J. 07632

Here we go again—Improving the Sorting Breed!

That sleek young thoroughbred out in our main paddock is SyncSort OS, Release 2.5. It's by SyncSort 2.4 out of that celebrated brood mare, High Technology. And it's destined to win a lot of prizes on OS/VS and MVS/XA tracks.

IMPROVING THE UNIMPROVABLE: Until now, SyncSort 2.4 was the best OS/VS sort program ever bred. It was far faster than any IBM sort. And it was easier to use, too— thanks to a tack-room full of advanced features.

SyncSort 2.4 probably could have continued to win prizes for years. There was only one catch—it wasn't good enough for us.

PICKING TOMORROW'S WINNERS: We knew that new hardware and software systems would create opportunities for evolution of advanced sort programs. Speed would still be essential. But productivity would continue to skyrocket in importance. So that's the way we bred 2.5.

FASTER SORT PERFORMANCE: We've added new sorting techniques to SyncSort 2.5 to make it the only sort that outperforms 2.4. You can expect savings in critical resources up to those shown at lower left. And that can add up to a big increase in total systems throughput.

NEW PROGRAMMER PRODUCTIVITY FEATURES: As any seasoned sort-watcher knows, there's a lot more to data handling than sorting. SyncSort 2.5 introduces a Data Utility set that applies its proven techniques to a wide range of processing and reporting jobs.

For example, with a single execution, 2.5 can sort, format and present data in virtually any form you want:

- **SortWriter**—a powerful tool that can produce extensive reports as a by-product of your normal sorting—without user exits and the associated programmer investment. Headers, trailers, total and sub-total capabilities provide flexible formatting.
- **Record Formatting**—To existing features like INCLUDE/OMIT, INREC/OUTREC, SUM and others—all of which have been expanded—2.5 adds new and useful capabilities like data conversion, editing, insertion of literals.
- **Multiple Output**—From a single sorted file, you can create multiple files and reports. Each can include the same or different data as determined by INCLUDE, OMIT, OUTFIL or OUTREC parameters.

If you're tired of betting on sort programs that empty your pockets of resources and are tough to handle, give us a call. We'll arrange to have SyncSort OS 2.5 run a few furlongs on your own turf.

GM from page 1

who wishes to continue working for the automaker. He said EDS has already hired a number of contractors who expressed interest in joining the company.

"It will probably be a year before there is any significant reduction in the use of outside contractors," Riedlinger said. "But no one will be put out of a job. We will offer employment to any of those people [personnel agencies] want to release and to any individual who wants to come to EDS. But over the long haul, it is our intention to eliminate the contractors the agencies are providing to GM."

An 'artificial' situation

Riedlinger described GM's extensive use of contractors as an "artificial" situation, stemming from the automaker's self-imposed head-count restrictions that resulted from a hiring freeze instituted several years ago. "EDS has never relied on outside [personnel] vendors," he said. "It is our style to provide services to our customers, including GM, directly through full-time employees who are committed to the same goals and objectives that EDS is."

Contractors' concerns about job security apparently stemmed from what Riedlinger characterized as an "offhand" remark made by an EDS employee during one of the company's more than 100 transition meetings with GM DP personnel. Asked about EDS' attitude regarding contractors, the representative responded, "The use of outside [personnel] vendors is like dope — once you get hooked on them, it's hard to quit."

"That meeting in July, which was attended by about 125 people, was only open to GM employees — contractors were not supposed to be present," Riedlinger said. "But a bunch of contract employees came to the meeting anyway and they started asking questions that we were not prepared to answer. It was an offhand remark made by an EDS employee on the spur of the moment in response to a question he thought came from a GM employee."

> *'Over the long haul, it is our intention to eliminate the contractors the agencies are providing to [General Motors].'*
>
> — Ken Riedlinger, senior vice-president, Electronic Data Systems Corp.

But one GM contractor, who asked not to be identified, said the remark was indicative of EDS' "gunslinger" approach to the contractor issue. "There are lots of ways to handle a conversion," the worker said, "but this is something else. Their approach to us was not at all friendly. They really started off on the wrong foot with all that hot and heavy stuff about dope."

According to Judy Daniels, president of the Lansing, Mich.-based personnel firm Human Resources Unlimited, Inc., many of the 30 data processing contract workers her agency had placed with GM's Oldsmobile facility in Lansing were concerned about the EDS takeover.

"I received quite a few calls from our contract people. They thought they were going to be out the door the very next week," she said. "It was very hard for them to separate fact from fiction. Although a number of them were later offered positions with EDS, they were hesitant to go because the whole thing was handled so poorly." Daniels said EDS had offered a three-year contract to her agency to continue supplying contract workers — a proposal that seems to contradict Riedlinger's one-year timetable for the replacement of those GM workers. Albert Schornberg, president of Analytical Technologies, Inc., a Birmingham, Mich.-based personnel firm that currently supplies about 75 contract workers to GM's Oldsmobile and Chevrolet divisions, said EDS informed his agency that it would need those workers for between two and three years.

According to Schornberg, the salaries of the contract workers his firm has placed with GM range from $22,000 to as much as $50,000 annually. He said EDS had approached him in an effort to recruit some of the contract workers as EDS employees, but his firm declined the offer.

"Anytime there is a major change like this, it causes concern among the workers," Schornberg said. "But [EDS'] relationship with us has been straightforward. They explained exactly what they wanted to do, and that was very helpful."

NIXDORF from page 1

8890 models are field-upgradable, the firm said.

The Model 12 can accommodate up to 2M bytes of main memory and up to 32 local or remote workstations. It offers an internal performance roughly equal to that of the older entry-level 8890 Model 10. The Model 10 supports 1M byte of main memory. A basic Model 12 configuration including the CPU, console and 1M byte of main memory costs $28,750, the vendor said.

The Model 32 can support from 2M to 4M bytes of main memory — twice as much as the Model 30 — and can support up to 96 local or remote workstations. The Model 32 is said to offer roughly the same internal performance as the Model 30. A basic configuration of the Model 32 including the processor, console and 2M bytes of main memory costs $46,500, the vendor said.

The Model 52 offers from 2M to 6M bytes of main memory and, like the Model 32, can support up to 96 local or remote workstations. The Model 52 can also support up to four system printers. The unit offers about the same performance as the current Model 50. The Model 50, however, offers a maximum main memory capacity of 4M bytes. A basic Model 52 configuration including the CPU, console and 2M bytes of main memory costs $53,500, the company said.

Topping off the 8890 line, the Model 72 is said to offer from 4M to 8M bytes of main memory and about the same internal performance as the 8890 Model 70. Like the Model 52, the Model 72 supports up to 96 workstations and four system printers. A basic configuration including CPU, console and 4M bytes of main memory costs $85,500, the vendor said.

The 8890 line can use Nixdorf's Nidos/VSE operating system as well as IBM's DOS/VSE, DOS/VSE-SP, SSX/VSE and VM/SP operating systems, a spokeswoman said.

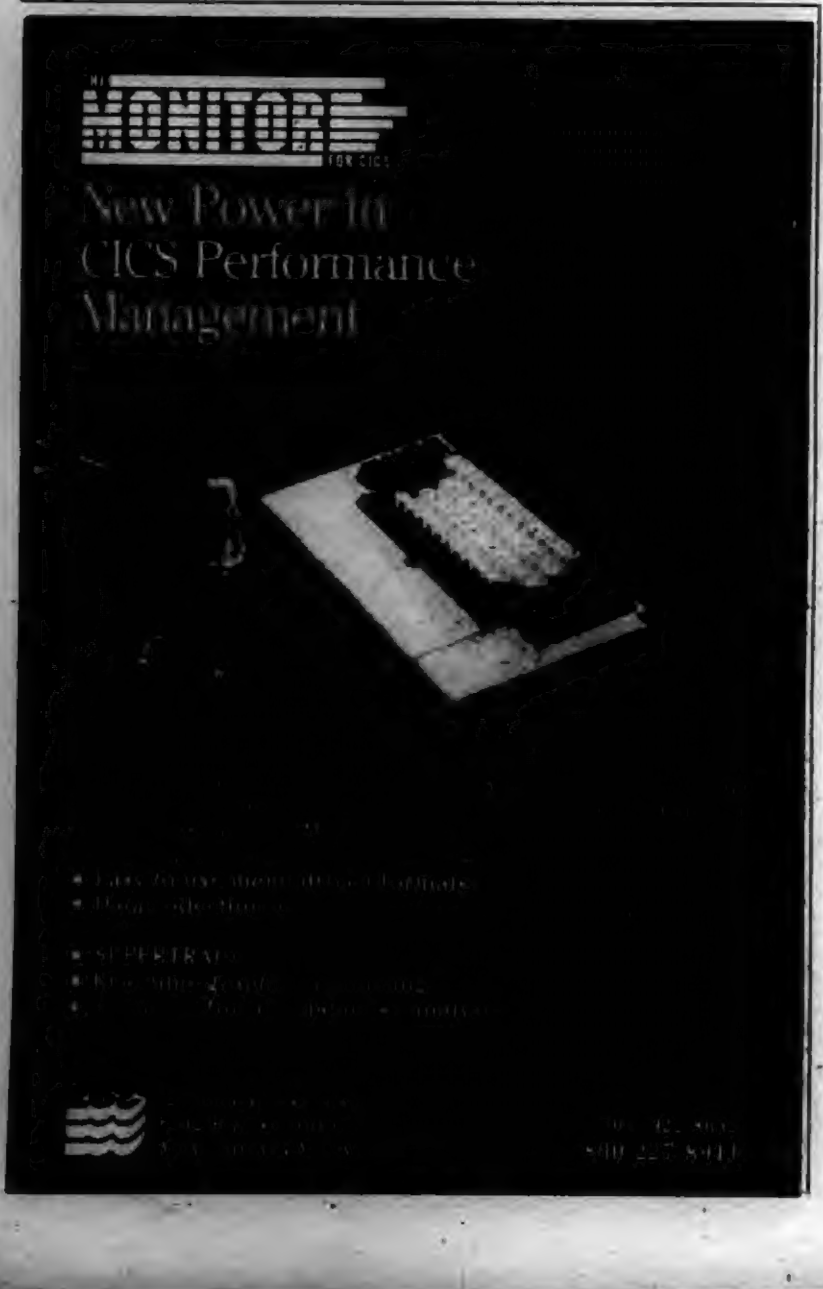
In addition, Nixdorf said, it plans to offer a preconfigured version of its 8890 Model 10 processor for distributed processing and networking applications. Called the 8890/CP, the unit includes 1M byte of main memory and integrated adapters for peripheral devices, including terminals, disk drives, printers, communications lines and tape subsystems.

The 8890/CP includes four of the company's 8278 CRT terminals. The vendor said the unit can be expanded to support 16 terminals. A streaming tape drive with a 1,600 bit/in. recording density and a data transfer rate of 20K byte/sec in a start/stop mode and 160K byte/sec in a streaming mode is also included.

A steel band printer that operates at 300 line/min is standard on the the 8890/CP. Printers that operate at 600 or 1,200 line/min can also be used with the 8890/CP, the vendor said. Four communications lines are included with the 8890/CP, as are two 129M-byte fixed-media disk drives. The disk drives are equivalent to IBM's 3310 disk drives, the vendor said.

Software included with the 8890/CP includes Nixdorf's Nidos/VSE operating system, an Ansi 74 Cobol compiler, an installation tool for tailoring the system to the user's application and a transaction control program.

The 8890/CP costs $99,950. It and the other newly announced 8890 models are available immediately. Nixdorf Computer is located at 300 Third Ave., Waltham, Mass. 02154.



Cast your net story our way

Are you lost in a forest of local-area or long-haul networks? Let *Computerworld*'s February Special Report on communications networks update you on network architectures, communications software, independent software and satellite communications.

Contributions to the Special Report should be either tutorial articles discussing issues or trends or applications stories outlining a particular user firm's experience.

Articles may range from four to six typed, double-spaced pages. Artwork is welcome.

The submission deadline for the February Special Report is Dec. 28.

If you have a story to tell, write to Janet Fiderio, Special Reports Editor, *Computerworld*, Box 880, 375 Cochituate Road, Framingham 01701.

GM employees win some, lose some in transfer to EDS

By John Gallant
CW Staff

DETROIT — Ten thousand General Motors Corp. data processing employees who will soon be transferred to its newly acquired subsidiary, Electronic Data Systems Corp. (EDS) will enjoy a generous stock bonus award, but will lose such benefits as overtime pay, cost-of-living allowances and retiree health insurance.

In a transition plan presented to GM DP workers on Nov. 1, EDS announced that it intends to continue paying the employees' current salaries, including a final cost-of-living allowance that will be rolled into the workers' base pay at the end of the year. GM's U.S. employees will officially become members of EDS' work force on Jan. 1, following stockholder approval in mid-October of the auto giant's $2.5 billion takeover of EDS. Workers in GM plants outside the U.S. will be added to the EDS payroll during the next six months, according to EDS Senior Vice-President Ken Riedlinger.

Riedlinger said the GM workers transferred to EDS will receive between 100 and 1,000 shares of GM Class E stock, a new stock class that resulted from the merger, at 5 cents a share. The number of shares each employee receives reportedly will be based on the worker's age and number of years of service. With a market value of $46.25 as of Nov. 5, the stock award would be worth between $4,625 and $46,250. EDS said the total number of shares to be awarded will be between 2.25 million and 3 million. The award is intended as a one-time bonus, although the GM employees will be eligible for future stock awards based on performance.

Workers excited, but concerned

GM DP workers interviewed by *Computerworld* following the announcement of the transition plan said they were excited about what they considered to be the lucrative stock award, but were concerned about the loss of overtime pay, cost-of-living allowances and health insurance after retirement.

A GM spokesman said last week that about 95% of GM's 126,000 white-collar workers each receive a total of some $6,000 annually in quarterly cost-of-living allowances. Despite employee concerns, Riedlinger said, EDS' merit increases, which he said are paid more frequently than is the practice at GM, will more than compensate for the loss of cost-of-living allowances.

"People have tended to discuss only one side of this change — the loss of some benefits," Riedlinger said. "EDS merit raises average less than a year apart, and the average merit raise is 11%. The average merit raise at GM is only 3%, and it occurs no more frequently than once a year. If you take a [cost-of-living allowance] plus a 3% maximum merit raise and compare that with EDS' average, the EDS system is obviously going to be putting more money in the hands of GM employees than the GM system they say they want to keep."

Riedlinger conceded that EDS does not provide health insurance coverage for retired employees, but he said that was because the company "had not had that many people retire.

"We are a young company, and we haven't really faced that issue," he explained. "But I don't think there is a company in the world that pays greater attention to the needs of its employees than EDS. We take care of every legitimate employee need, and retiree health insurance is something that could be considered in the future."

Riedlinger said that in situations covered by federal law, EDS will continue to reimburse GM employees for overtime work, but that EDS does not embrace the practice of paying overtime wages to its salaried employees.

"Between now and Jan. 1, we will identify those overtime-related situations where we have to do one of three things," he explained. "We will either hire additional people to alleviate any work load problem, make a salary adjustment to any person who must work overtime or cover the situation through performance bonuses."

On the topic of worker relocation, he said no GM worker will be forced to transfer against his will. But EDS' philosophy is that advancement opportunities — and the salary increases that go with them — go to workers who are willing to transfer.

"When you have a company that is growing like we are, there are lots of opportunities all over the place," an EDS spokeswoman said. "Employees are asked if they would like to participate, and if they do not, there is no black mark placed against them. But if they choose to stay in one geographic location, they will be limited in the number of opportunities they are afforded."

One GM employee, who asked not to be named, said many workers are angry about the changes. "Although most of the ambiguity is gone now, people are generally pretty mad. The attitude is that GM sold us out. . . . The retirement health care cancellation is probably the single biggest issue here. We hired on with GM with the understanding that we had those excellent retirement benefits, and a lot of people stayed on with GM because of them. A lot of people are dismayed."

Computer criminal profiled as 'modern-day Robin Hood'

CW AT DPMA

By Kathleen Sullivan
CW West Coast Bureau

ANAHEIM, Calif. — If the Federal Bureau of Investigation were to produce a composite portrait of the typical computer criminal, the picture that would emerge would show a young, talented employee, working in a position of trust in a company.

"We're not dealing with a Hal [the master computer] as in the film *2001: A Space Odyssey*, said FBI special agent James Donckels in a presentation before a seminar audience at last week's Data Processing Management Association's (DPMA) annual meeting held here. "The television show *Knight Rider* is nice," he continued, "but Kitt [the computerized car with a mind of its own] is not the thing we're dealing with."

Instead, Donckels said, data processing professionals are contemplating a problem that has a human face. It is a youthful one: The median age of the person who commits a computer-related crime is only 25 years old, he said. In most cases, he is an employee who thinks of himself as a "modern-day Robin Hood" and considers the illegal activity to be a game or a "challenging intellectual exercise," Donckels said.

In general, the employee commits the illegal activity while working. Usually, he works alone and enlists the aid of an accomplice only when he comes up against the limits of his technical ability to gain further access to the computer system, Donckels said.

Although there are no accurate figures on the extent of computer-related crime, Donckels said that 58% of the illegal acts are committed at the data entry level. Another 35% occur at the computer programming and machine operating level, while in 7% of the cases, the person penetrates a computer's operating system or the firm's communications facilities.

Donckels said the FBI faces unique problems in conducting investigations of computer-related crimes. Fearing public discredit and notoriety, few companies report the illegal activity. Because of the nature of the high-technology industry, which is constantly changing, data processing managers are not always familiar with their systems and would not be able to detect whether a crime had been committed, he said.

Because the evidence of a crime, such as an unauthorized entry into a system, can be easily destroyed, the FBI encounters problems obtaining the proof it needs to demonstrate the illegal activity. In addition, U.S. courts have not yet decided what constitutes the best evidence in a computer crime case, he said.

Investigations are also hampered by a lack of federal and state statutes allowing the prosecution of computer crime, said Clyde H. Wilson Jr., a Florida-based attorney who specializes in DP law.

"The evolution of law is slow, while the evolution of technology is fast," he said. A gap now exists between the two, he said. The laws currently on the books are difficult to apply to the new phenomenon. Laws relating to larceny, embezzlement, malicious mischief and wire fraud, for instance, do not address the unique characteristics of computer crime, he said.

While a variety of states have passed legislation relating to computer crime, Wilson described the situation as a "national problem that requires a national solution."

In the meantime, DP managers can take a number of steps to help minimize computer crime, said Louis R. Mills, president of Henge Corp., a California-based consulting firm. He said companies should restrict access to computer equipment, output reports, security procedures, data communications equipment and computer terminals. In addition, he made the following suggestions:

- Identify those employees who can do the most harm and pay attention to their work activities as well as their emotional well-being.
- Prevent the data processing staff from originating transactions.
- Use decoys or phony names in master files to help determine evidence of tampering.
- Do not let people work alone.
- Build in audit trails at all levels and require balancing and recording before continuing work.

STUDY

from page 1

"That is a controversial statement," Dell conceded. "But programming has not been a rigorous activity. It has been more like a craft than a profession. If you look at it in terms of traditional engineering disciplines, it has not been highly professional. It is a field that has grown rapidly, and its attitudes have not kept pace with what needs to be done."

But despite that gloomy overview, the study's findings point to a more rosy picture of the software development future. In what Diebold labeled a "major trend," the study stated that software development is becoming a more professional discipline. Diebold found that program design methodologies and "metrics for program quality and programmer productivity are beginning to mature and become a part of developing computer science curricula." In addition, researchers found the requirement of undergraduate and even graduate work in software engineering becoming more common in the hiring of programmers.

> *It is not surprising that the programming community is widely considered to be inadequate in delivering usable, reliable programs; forecasting costs, resources and schedules; and achieving productivity rates 'even close to being economically justifiable.'*
>
> — Diebold Research Program study

"Large corporations are not interested any longer in hiring people with just a couple of years' experience," Dell said. "Companies are looking more carefully at getting good people and holding on to them. Firms are looking at instituting better management practices, and that requires a more professional class of people."

Among the study's other findings:

- Software engineering development and management methods are evolving that were designed to control costs, create a more reliable product and increase productivity.
- Efforts to improve productivity have too often focused on the production of code itself. Diebold's research suggested that greater payoffs can be achieved by better supporting the actual design portion of the development process and by assuring quality through rigorous testing early in the product life cycle.
- A maturing of program management methods is taking place. The study concluded that there is a keener appreciation of the nature of the management role in the development process and a better understanding of the "importance of professional management that exercises control."
- A new class of what Diebold called MIS paraprofessionals is arising to support end users, who are generating a greater amount of information on their own. These paraprofessionals will free professional programmers' time for more complex efforts.

"We predict that in the future there will be a smaller corps of elite programmers divided into two camps," Dell said. "One group will be responsible for supporting people and for dealing with systems that are not intended to last a long time — those are the so-called paraprofessionals. The second corps of professionals will be the programmers who design large systems with a view toward the reliability of those systems and the optimization of resources."

Tandy chief ponders micro market's future

CW AT DPMA

ANAHEIM, Calif. — Which companies will survive the microcomputer shakeout? Who will determine how business microcomputers are used? Do multiuser micros have a future?

These questions and other issues were addressed by John V. Roach, president of Tandy Corp., in his keynote speech at the Data Processing Management Association's (DPMA) annual conference here last week. Among his comments were:

■ **Which companies will survive the microcomputer shakeout?** The deciding factor will not be technology, Roach said. "IBM proved a long time ago that distribution is more important than products or technology."

■ **With increasing competition among companies,** hardware manufacturers are "playing in a whole new ballgame" with regard to price, performance and after-the-sale support, he noted.

'If the computer professional is willing to accept micros as a serious alternative, [he] will control the system.' — John V. Roach, Tandy Corp.

■ **Users will continue to benefit** as the price/performance ratio of micros continues to improve, but some companies are shortchanging users on support, Roach added. "Many manufacturers are not providing the level of service and support they should."

■ **The introduction of microcomputers to the business world** has ensured that the "office of the future" will arrive sooner than many observers expected, he said.

■ **Networked micros would emerge as the winner** in the battle between networks and multiuser systems, Roach predicted.

Although a multiuser system has advantages in certain situations, microcomputer companies are adding features, such as graphics capabilities, that will make the machines more attractive to users. "Dumb terminals don't support graphics," he said, "and users are beginning to expect graphics-oriented systems."

Price will also be a factor. "The cost of microcomputers is approaching the cost of dumb terminals," he noted. "That will reduce the multiuser advantage."

In the future, multiuser microcomputers will "simply become an adjunct to a network of personal computers in an office," he said, adding that a variety of networking schemes will be available.

■ **Who will determine how micros will be used** — the DP manager or the end user? That depends on whether the DP department recognizes the importance of the technology, Roach said.

"If the computer professional is willing to accept microcomputers as a serious alternative, [he] will control the system," he explained. "But if [he] refuses to recognize the just place of micros, the users will attempt to control the systems, because they must have the productivity gains made possible by microcomputer technology."

■ **Don't wait for the perfect system,** Roach warned. Instead, look for a system that answers most of your organization's needs and, at the same time, leave room to integrate new technologies as they emerge.

Roach

Data processing to expand role via micro integration
DP managers anticipate corporate personal computing to relieve applications backlog

CW AT DPMA

By Kathleen Sullivan
CW West Coast Bureau

ANAHEIM, Calif. — Will the introduction of personal computers into the corporate environment help chip away at the applications backlog that has been steadily accumulating in data processing departments?

In interviews with DP managers here at last week's Data Processing Management Association (DPMA) annual conference, most respondents answered that question with a qualified "yes."

Personal computers will be used to meet many of the pent-up needs of users for applications programs, they said.

At the same time, however, personal computer users represent a new breed of users and they are placing new demands on the data processing staff.

Quicker response to users

James Boone, manager of data processing at Compressor Systems, Inc., a Midland, Texas-based company that manufactures natural gas compressors, said personal computers will help managers respond more quickly to many user's applications requests.

In addition, personal computers will help users devise some new solutions to some old problems.

"We have the ability to do things with microcomputers that we couldn't have done with a mainframe, such as remote billing," Boone said. "But at the same time, we want to integrate those systems into our information gathering process. So we are taking on a new job: making personal computers fit into the traditional data processing department."

> *'We are taking on a new job: making personal computers fit into the traditional DP department.'*
>
> — James Boone, DP manager at Compressor Systems, Inc.

Dan Shirey, director of information services for Perkins-Prothro Co., an independent oil and gas producer based in Wichita Falls, Texas, agreed, saying that personal computers had added an "entirely new spectrum" to the work of data processing managers.

"We are no longer just managers of people who write programs and collect data," Shirey said. "We have become the group that understands the information flow in a company."

Personal computers are introducing computing to a new audience of users, Shirey said. "People traditionally resistant to computers are now eager to automate their departments with microcomputers," Shirey said.

John C. Aldredge, manager of the information services department for the city of Lubbock, Texas, said that in the short run, personal computers would increase the work load of the data processing staff, because microcomputer users "require an extremely personal form of system development."

Aldredge's department now performs hardware and software evaluation for its personal computer users, in addition to maintenance and support. The city's information services department reassigned personnal to handle microcomputer support, he said.

H. Faye Booker, supervisor of systems analysis and programming at the U.S. government's Postal Data Center in St. Louis, said her agency was just beginning to use personal computers.

Because the agency's data processing staff spends much of its time maintaining its large systems, it has trouble meeting the needs of users, she said.

Booker said microcomputers will give users the ability to produce their own reports, which will help reduce the work load of the agency's systems and programming area.

The Postal Data Center will rely on a personal computer coordinator to handle microcomputer support, she said.

James J. Kilian, data processing manager of Templeton Kenly & Co., a Bensenville, Ill.-based manufacturer of heavy lifting equipment, said his company was also a newcomer to personal computing.

The company, which had been looking for a mainframe data base package to keep track of its fixed assets, recently decided to use a personal computer data base package instead of the mainframe one, according to Kilian.

Richard F. Gehrt, who is in charge of processing services for Employers Insurance of Wausau (Wis.), said his company is using personal computers in a variety of small, independent application areas.

When asked if he thought microcomputers would help cut into the applications backlog, according to Gehrt, "I should hope so. If they don't, we really have a problem on our hands."

TEST YOUR
I-QUME
for value

What terminal gives you a superior combination of features and price? And what distributor gives you an in-stock selection of that terminal at especially attractive prices?

If you answered QUME for the terminal and PMS for the distributor, your I-QUME is in the superior range. Together, QUME and PMS provide the performance solution at the perfect price.

Flexibility
Each QUME terminal is designed with a host of exceptional features. And each offers you options for even greater flexibility. Even better than that, PMS will modify and customize you!

QUME terminal to provide the best match for your requirements.

Responsiveness
QUME responds with operational versatility and operator comfort and convenience. PMS adds to QUME's responsiveness with a comprehensive service package that includes consultation and analysis, immediate delivery and a toll-free service line.

Affordability
Each QUME terminal offers more standard features for a lot less money. And for a limited time, from November 1 to December 31, 1984, **PMS has the best price on QUME terminals in the country.** Just call and put us to the test.

Source code control is only one step in software configuration management.

Softool's Change and Configuration Control (CCC®) takes you all the way to *full* configuration control!

CCC automates: Management of changes and configurations, control over who makes what type of changes and where, tracking of trouble reports, reconstruction of previous versions, management reports, archiving, and all the remaining "steps" to total configuration control.

CCC is interactive and friendly.
It supports all programming languages, and comes with on-line tutorials.

Available now! Over 1000 Softool products are installed worldwide.

CCC is supported on the DEC VAX, DG MV, Gould S.E.L., Honeywell 6000 (Level 66 and DPS 8), HP 9000, and IBM 370, 30XX and 43XX computers.

There is more. CCC is a stand-alone component of SOFTOOL®
An Integrated Programming Environment (PE®) is also available.

If you want true configuration control, where all components of a given release can be managed as a unit, there is only one choice: CCC.

Call for more details or a hands-on demonstration.

See us at DEXPO booth #2940

Proven in MIL-STD Applications!

Networks won't become obsolete, consultant assures

Tells users to consider net upgrades to larger systems, warns of linkup penalties

CW AT DPMA

By Kathleen Sullivan
CW West Coast Bureau

ANAHEIM, Calif. — Is your company grappling with the issues related to installing a local-area network? If so, Linda T. Taylor, vice-president of Gaskell & Taylor Engineering, Inc., a Los Angeles-based consulting firm, offers some reassuring words.

"No matter what system you choose," she told a seminar audience at last week's Data Processing Management Association's (DPMA) annual meeting, "it won't become a throwaway system." Whatever a firm decides to use today will be usable in the future as a component of a larger system, she added.

Networks available today will become obsolete tomorrow only if the [redacted] cides to stop supporting its products, Taylor said. "Networks will not become obsolete just because something slicker comes out on the market," she [redacted]

However, there are some penalties users will incur when they link their present networks with later versions, Taylor said. The system will take longer to respond, she warned, and its increased complexity means problems will be harder to diagnose. In addition, a higher level of expertise will be required to support the system, and it will be more expensive to maintain, she said.

For some users, the most pressing question is whether their organization should install a local-area network or a private branch exchange (PBX), Taylor said.

Taylor said local-area networks provide an "inexpensive entry into office automation," are relatively simple to install and can be easily expanded.

In addition, most local-area networks include electronic mail and print-spooling capabilities and provide a hard disk capacity of between 10M and 256M bytes, she said.

What are the disadvantages of these networks? At present, they can only handle data transmission, Taylor noted. Coaxial cable is not only expensive, but it also requires a conduit in the walls, she said.

According to Taylor, too many protocols and standards are being worked on by various standardization groups. Thus, incompatibility remains a problem. And finally, gateways — protocol converters that link dissimilar networks — have been slow in coming to the market and are expensive as well, she said.

A PBX system offers several advantages, Taylor said. Fourth-generation PBXs, which integrate voice, data and facsimile transmission, are already on the way, she noted, and offer a "great deal of intelligence and features."

Users will be able to get those features in a single desktop unit that will combine the functions of the terminal and telephone.

In addition, PBXs use twisted-pair copper wire, which is relatively inexpensive, Taylor said.

PBXs have other shortcomings, Taylor said. For instance, second-generation PBXs, using a blocking architecture, can "busy out" users.

Although third-generation PBXs were announced three years ago, few products have arrived on the market, Taylor said. And vendors have provided only limited software capabilities for PBXs.

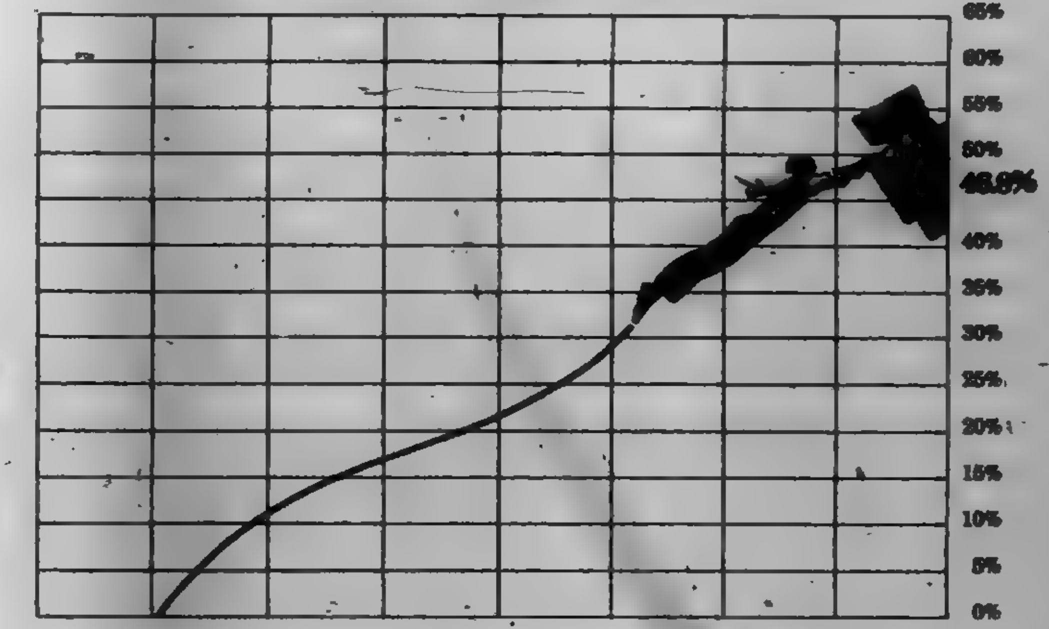
Eventually, Taylor said, the terms local-area network and PBX will disappear as the products converge into a single communications technology.

But Taylor said PBXs are not yet a "mature technology" and told users to wait another year and a half to two years before purchasing one.

"If you don't need to install a network right away, delay the decision at least eight months, until the next National Computer Conference," Taylor said, adding that she expects several product announcements at that show next July.

> *Networks available today will become obsolete tomorrow only if the local-area network manufacturer decides to stop supporting its products. 'Networks will not become obsolete just because something slicker comes out on the market.'*
>
> — Linda Taylor, Gaskell & Taylor Engineering, Inc.

InterTest™ users report a 46.8% savings in CICS testing and debugging time.*



InterTest really does fly!

In previous On-Line Software International ads, we've been saying that InterTest can help you "fly" through CICS testing.

Now we've conducted a survey* among InterTest users. They report that InterTest reduces the time spent testing and debugging CICS applications by an average of 46.8%.

And that's not the only "test" we've passed. A "Datamation" study** gave InterTest one of the highest overall user satisfaction scores of any systems software product.

InterTest makes its 1,400 users dramatically more productive by automatically detecting and preventing all CICS application errors *before they occur.* With InterTest, programming errors are detected and corrected interactively without dumps, recompilations or printed listings. And our latest release makes InterTest easier than ever to install, learn and use. But don't take our word for it. Call 800-526-0272 or send in our coupon for more details. InterTest really does fly. That's not a promise, it's a fact.

*On-Line Software prepared a questionnaire for all InterTest users that was distributed under the control of Ernst & Whinney, one of the Nation's leading public accounting firms, who then received the questionnaires and compiled and tabulated the responses. Respondents were asked, assuming it would take 100 hours to test and debug a CICS application without InterTest, how long would it take using InterTest. According to the results tabulated by Ernst & Whinney, users claim it would take an average of 53.2 hours.
**Datamation, December 1983 issue.

FBI seeks OK for white-collar crime suspect data base

By Bryan Wilkins
CW Washington Bureau

WASHINGTON, D.C. — The Federal Bureau of Investigation is proposing to expand its National Crime Information Center (NCIC) data base with a new file of white-collar criminal suspects, including pertinent information regarding investigations of financial crime.

The FBI's Criminal Investigative Division, which initiated the request to have the NCIC establish a so-called economic crime index (ECI), said there was a "need for more efficient and effective fieldwide coordination of major white-collar crime investigations.

"Because of a lack of coordination," FBI state law enforcement and other regulatory agencies now frequently initiate their own cases that involve the same fraud scheme.

Jerry Berman, legislative counsel to the American Civil Liberties Union said the proposed ECI "raises significant privacy concerns. We've said many times that no new files should be added to the NCIC without specific legislative authorization that deals with automation and standards for the data."

Berman added, "We're at the point where either NCIC becomes a system of accurate records — right now it is 60% inaccurate on the average — or Congress should discontinue funding, because [NCIC] continues to disseminate inaccurate information."

The Advisory Policy Board of the NCIC last month recommended that the ECI plan be approved. Attorney General William French Smith and FBI Director William Webster must first approve the plan, which the FBI is seeking to finalize by mid-1985.

The ECI plan has caused the chairman of the House Judiciary Committee's Subcommittee on Civil and Constitutional Rights, Rep. Don Edwards (D-Calif.), to write a letter to Webster and Smith questioning both the establishment of the file without formal congressional approval and the methods by which the information in the proposed index would be verified and updated.

Additionally, last month Edwards accused the FBI of "appearing to violate" the Federal Advisory Committee Act by barring a subcommittee counsel from attending sessions of the Planning and Evaluation subcommittee of the NCIC's Advisory Policy Board. The counsel had attended similar board meetings in the past. The FBI said the decision not to allow John Briley, the counsel, to attend was "based on sound legal precedent."

The FBI has not responded to Edwards' accusations, according to a subcommittee spokesman. The Advisory Policy Board meetings were open to the public.

The FBI's plan would initially make the index available only to 11 FBI field offices and the Department of Justice. But within two years, approximately 64,000 federal, state and local law enforcement agencies now using the NCIC would have online access to the ECI file.

The ECI file would, according to plans, automatically determine whether the subject is already on any of the other 12 files maintained by NCIC. The file would include names, aliases, associates, telephone numbers, vehicle data, business phones, bank account numbers and miscellaneous information.

Congressional concern over the creation of a new file for the NCIC is not new. Last year, the FBI dropped plans to create a suspect file on terrorists and organized crime after objections were raised.

The oversight committees of Congress have questioned the methods of NCIC users to upgrade the accuracy of the files on individuals after their cases have been dispensed with by the justice system. The data accuracy issue has been acknowledged by top FBI officials.

WASHINGTON UPDATE
Mitch Betts
CW Washington Bureau

IRS rules limit home micro business tax deductions

WASHINGTON, D.C. — The Internal Revenue Service recently issued temporary rules implementing legislation that restricts the availability of business tax deductions and credits for home personal computers.

The Tax Reform Act of 1984 [CW, July 2] states that business depreciation and investment tax credit benefits are permitted only if the personal computer is required for employment and is used at least 50% of the time for business. The temporary regulations, published last month, apply to all computers and peripheral equipment used outside a regular place of business, the IRS said.

To obtain business tax write-offs, the taxpayer must keep a log showing how much time the personal computer was used for business purposes.

"Each entry in the log, journal, diary or similar record shall be made at or near to the time the listed property is actually used," the IRS rules said.

GSA offers federal agencies help with planning, analysis

WASHINGTON, D.C. — The U.S. General Services Administration (GSA) recently announced a program in which the GSA's Office of Information Resources Management will provide planning assistance for other federal information management offices.

Sally Bennett, a planning specialist, said the office has prepared a booklet offering a "cookbook" approach to strategic planning and also offers on-site analysis for strategic, long-range and tactical planning.

Frank J. Carr, assistant GSA administrator, said the planning support program can be used to produce a basic plan, procedures to carry it out and a management system to sustain it. The GSA planning service is available on a cost-reimbursable basis, he said.

Carr said the planning procedure was developed and used by the GSA itself and subsequently was used by the Federal Aviation Administration, the Indian Health Service and the Bureau of Land Management.

Census Bureau to launch first count of U.S. robots

WASHINGTON, D.C. — Starting in January, the U.S. Bureau of the Census plans to count, for the first time, the growing population of robots in the U.S.

The first annual robot census survey will be mailed to about 100 robot manufacturers, which will be required by law to provide information about their 1984 products. It will be the first time the bureau's Current Industrial Report series will specifically cover robots, bureau officials said.

"The results of this survey will provide policymakers with an information base to assess the impact of the growth of robotics on our economy," the bureau said. "Data will be used in making trend projections, market analysis, product planning and so forth," it added.

More computer filing urged in Medicaid, Medicare claims

WASHINGTON, D.C. — The federal government should encourage hospitals and other health care providers to make greater use of computer media when filing Medicare and Medicaid claims, according to a new report from the U.S. Department of Health and Human Services.

Richard P. Kusserow, the agency's inspector general, said the Health Care Financing Administration (HCFA) could save an estimated $197 million a year with maximum use of "electronic media claims" such as magnetic tapes or disks or data communications. The report said the savings would result primarily from eliminating data entry costs.

Kusserow's report noted that the HCFA already supports the use of electronic filing by the health care industry, but said it needs to remove certain deterrents and especially encourage the use of electronic media by high-volume filers.

The report added that when replacing the paper forms with electronic filing, it is important to establish a reliable audit trail that permits prosecution of fraudulent claims.

Judge reduces damages awarded in Qantel fraud complaint case

By James Connolly
CW Staff

HAYWARD, Calif. — The trial judge, citing the jury's "passion," has reduced the punitive damages assessed against MDS Qantel, Inc. from $10 million to $1.5 million in a case involving a fraud complaint brought by a former distributor of Qantel products.

The distributor, Datapro Corp. of Detroit, recently accepted Alameda Superior Court Judge M.O. Sabraw's suggestion that $1.5 million in punitive damages is sufficient. Datapro's option was to retry the case, decided by a jury here in August, before a new jury on the question of punitive damages. Judge Sabraw let stand $2.69 million in actual damages that the jury said Datapro suffered.

In reducing the jury's punitive damage award, Judge Sabraw said it had been "at least suggestive of passion and prejudice."

Datapro to appeal

John C. Walters, senior vice-president for legal affairs of Mohawk Data Sciences Corp., Qantel's parent company, said, "We are pleased that the jury's punitive damage award in this matter, which we believe to have been totally irresponsible and unsupportable, has been drastically reduced by the judge. At the same time, we continue to believe that there is no factual or legal basis for the original award made in favor of the defendant [Datapro] in this action and we expect to appeal this matter in order to have the entire jury verdict reversed."

The case centered on Datapro's claim that Qantel's Solutions accounting software and other products were defective and that Qantel deceived distributors. Datapro attorney Thomas Christo claimed that Qantel "used the distributors as a shield while its products were defective." He said Qantel had planned to direct-market its products after the defects were removed.

Christo noted that his motion to have Qantel pay $3 million in interest and fees is still pending before Judge Sabraw.

Qantel had brought an initial suit in 1982, and Datapro filed a fraud counterclaim. Qantel won a $240,000 settlement on its original breach of contract claim. That settlement and any interest and legal fees that Qantel is awarded will be subtracted from the $4.2 million that Datapro won.

The California case is the second multimillion dollar setback for Qantel. In July, a federal appeals court in Boston upheld a $6 million contract fraud judgement won by a former Qantel distributor. That award to Computer System Engineering, Inc. of Burlington, Mass., included $2.3 million in actual damages, $2.3 million in punitive damages and $257,000 in legal fees.

SYSTEM INTEGRATORS

SEEKING CANDIDATES NEEDING COMMUNICATION SOFTWARE AND WISHING TO AVOID LONG AND COSTLY DEVELOPMENT CYCLES.

Candidates should possess clients who require communication between micros, minis and mainframe computers.

Your goals should include accurate terminal emulation and file-transfer capabilities.

In return, Polygon¹ offers the industry's best communication products for applicants seeking asynchronous and synchronous communication capabilities.

Candidates should contact Polygon's department of sales recruitment.

Representatives from Polygon will be available to speak with prospective candidates personally at COMDEX/Fall, Las Vegas Convention Center, Booth 4300.

AT&T suggests rate hike; contingent on FCC action

By Phil Hirsch
CW Washington Bureau

WASHINGTON, D.C. — While claiming it would prefer not to raise its rates, AT&T last week said it may nonetheless have to do so should the Federal Communications Commission grant rate increases proposed by local telephone companies. The AT&T comment came in the wake of the local phone companies' proposal to charge more for access to AT&T's Message Toll Service (MTS), Wats and competing long-distance services beginning Dec. 1.

Meanwhile, a spokesman for MCI Telecommunications Corp. said his company will absorb the increase if it is granted.

The proposed rates would add about 6.6% to the premium access fee levied on AT&T and about 6.8% to the access fees paid by other common carriers.

The tariff containing the proposed charges was filed Oct. 17 by the National Exchange Carriers Association (Neca), which represents the bulk of the nation's local exchange carriers. However, at least one carrier — United Telephone System — will file a separate tariff and has already announced it will charge less than Neca has proposed.

Separate access tariffs also may be filed by a number of other local carriers, including GTE Corp. and the divested Bell operating companies serving the mid-Atlantic states, the West Coast and much of the Midwest.

A few days after Neca's tariff revisions reached the commission, MCI asked the commission to reject the filing. On Nov. 1, MCI was joined by two groups representing corporate communications users and by AT&T. AT&T asked the commission to suspend the higher rates for up to five months.

Last May, when the FCC authorized the present rates for local access to MTS, Wats and the switched public long-distance services provided by the other common carriers, the commission said local carriers were entitled to a 12.75% rate of return. However, in a statement accompanying its Oct. 17 filing, Neca told the commission that the proposed rates were that time have not produced the prescribed level of earnings. The association added that the proposed rates were designed to eliminate the shortfall; they will increase local carriers' revenue an estimated $850 million per year.

MCI spokesman Gary Tobin said Neca's proposed rate increase, if granted, will only be temporary; a surcharge of $1 or $2 per month is likely to be imposed soon after on residential and single-line business users, he explained, and once that fee is in place, charges levied by local carriers on long-distance carriers will be reduced accordingly.

Linc users form group in California

SAN FRANCISCO — Users of Burroughs Corp.'s Linc language here have formed their own users group, known as Local Users of Linc and Lirc (Lull). Lirc is the reporting feature that comes with Linc.

According to Jan Terry, manager of systems development for Koret of North America, a subsidiary of Levi Strauss & Co., and one of the users group principals, Lull's goal is to exchange coding techniques and expertise to resolve programming problems. Although the group now consists of five companies, Terry said the group is open to all companies that use Linc to program Burroughs mainframes.

More information on the group is available from Terry at Koret of North America, 611 Mission St., San Francisco, Calif. 94105.

TELECOM BRIEFS
Phil Hirsch
CW Washington Bureau

Terminal liability under AT&T debated

WASHINGTON, D.C. — "The [divested Bell operating companies] and [AT&T Information Systems] may have agreed between themselves that the so-called fixed-term contracts [would] be reassigned; but in so doing, the [divested companies] and [AT&T Information Systems] could not bind customers who were never parties to such . . . agreements."

So said the North American Telecommunications Association (Nata) late last month in a statement to the Federal Communications Commission; the association represents independent manufacturers of private branch exchange, telephone and related equipment who compete with AT&T Information Systems, the telephone company's deregulated subsidiary. Nata's comment represented the latest round in an argument over terminal lease termination penalties. The specific issue is whether users who leased terminals from the divested Bell operating companies before divestiture are still liable for those charges now that ownership of the equipment has passed to AT&T Information Systems.

The phone company insisted the original contracts were made with AT&T, even though customers dealt only with the divested Bell companies; therefore, despite divestiture, the terms remain binding. Nata argued that the agreements signed between AT&T and the Bell operating companies at divestiture "specifically provided for the transfer of Bell operating company [terminal equipment] contracts to AT&T Information Systems. . . . If the [customer premises equipment] contracts really did belong to AT&T prior to divestiture, there would have been no need to transfer them."

Bruce P. Saypol, one of Nata's attorneys, said Nata is concerned about termination charges because AT&T reportedly is waiving the charges if customers will agree to buy or lease new terminal equipment from the telephone company instead of from competing suppliers. He added that although AT&T is telling customers that they are subject to the charges, "no one has been taken to court for refusing to pay them."

Divested companies seek FCC rule waiver

WASHINGTON, D.C. — "Will the public be better off if the divested Bell operating companies are allowed to perform end-to-end protocol conversion?" New Jersey Bell Telephone Co. posed this question to the Federal Communications Commission late last month.

Along with several other divested Bell operating companies, New Jersey Bell wants the commission to waive a provision of its Second Computer Inquiry Decision; the provision bars them from performing end-to-end protocol conversion except through separate, deregulated subsidiaries. The divested companies say that if allowed to offer protocol conversion directly, as part of packetized transmission services, they will charge far less than present vendors.

The vendors — notably Tymnet, Inc., GTE Telenet Communications Corp. and Uninet Telecommunications, Inc. — insist the divested Bell companies would achieve these lower prices by using revenue earned from other services to cross-subsidize the new offerings. The International Communications Association (ICA), a corporate communications users group, has raised the same issue. ICA said the commission should establish strict accounting procedures to prevent cross-subsidization; also, competing packet net service vendors should be allowed to install access concentrators in the divested Bell operating companies' central offices.

Late last month, in the final round of comments on the pending waiver petitions, the divested Bell operating companies insisted their packet nets would satisfy a presently unmet user need by offering network-based protocol conversion to those who cannot justify the cost of terminal-based converters. What good is software that sits silently while your users flounder through mistakes? Or that forces you to communicate in awkward SQL, QUEL, or one of their many dialects?

Only 1032 helps users think. It works with you the natural, real-world way: one thought at a time. First, it remembers your context from previous commands, so each thought builds on the last. Then it gives you immediate feedback at each step, so you know that you're on the right track.

That's relational DBMS with a powerful addition: common sense!

Use Your Fingers, Not Your Lap

If you get stuck, just touch a key. Even right in the middle of a word. System 1032's unique information keys tell you exactly what you need to know. You get all the benefits of menus with none of their hassles.

With other software, you'd have to struggle with a manual in your lap or huddle over lunch with your DP experts.

Everyone Speaks The Same Language

As you work, System 1032 envelops you in its integrated fourth-generation environment. Whether you're a new [illegible]

Ask for instant information when you want it, without annoying menus. From simple reminders to complete explanations and examples.

[illegible] Now, 1032 gives you elegant PASCAL-like flow control. So you can customize command sequences to the limits of your imagination. Test them interpretively or compile them for efficient repeated execution. From minor routines to major production applications.

Nothing Missing At The Top

System 1032's full complement of features improves you in areas other software neglects, saving precious time and machine resources.

Its native VAX design efficiently sup- [illegible]

[illegible] And 1032 performs identically from all VAX languages—without messy preprocessing or relinking when structures change.

$95 Workout

We've made System 1032 remarkably easy for you to try. A 60-day trial period costs just $95. Give it the full workout with your own data (or ours) in your own environment. You get fully operative software, three sets of manuals, and our hot-line support.

Call us at (617) 661-9440 for a free kit describing everything we've built into 1032 for you. Or send in the coupon below. Your users will never be the same.

System 1032's self-instructional Primer teaches new users how to get their work done. The comprehensive User's Guide and Host Language Interface manual describe everything needed for advanced applications and data base design.

HOW THE ISV CAN DEVELOP SOFTWARE FOR THE PC AT, PDQ.

Intel introduces the complete ISV Starter Kit. At a price that's also good news.

With this new package, within a day or two you can start developing Xenix 286 software for the PC AT, the multi-user micro standard.

You get immediate delivery on the fastest Xenix 80286 based supermicro in the solar system, plus all the software and training you need. A total-solution package unequalled by anyone.

All for as low as $5,750. For items that normally cost over $16,000.

The ISV Starter Kit includes 35% off the Intel 286/310-17 system, and the same discount can apply to one 311 tape back up subsystem.

Or buy three Intel 286/310-17 systems and get 50% off.

100% off (i.e., free) a comprehensive Xenix training class. $1050 value.

One free copy of Xenix, which includes a C compiler. $1500 value.

And one additional free $495-to-$3400 value language of your choice: COBOL, FORTRAN, or BASIC.

Which is a good deal in anybody's language.

Only Intel offers a complete package like this.

But the offer is good only for deliveries in 1984, so grab the phone.

To get complete information call toll free (800) 538-1876. Inside California, (800) 672-1833. Or call your local Intel sales office.

Because this really is DAASO.*

(*Definitely An Absolutely Sensational Offer.)

DC from page 17

net Telenet and other vendors currently offer network-based protocol conversion, admitted New Jersey Bell, but these companies serve a long-distance market, not the local market the divested Bell operating companies plan to tap.

Phone access rate-cut agreement reported

WASHINGTON, D.C. — Press reports have indicated that federal and state officials have agreed on an access charge for residential and single-line business users. Reportedly beginning next summer, these customers will pay $1/line monthly, and a year later, the charge will increase to $2. The new charge is important to larger companies because once it goes into effect, their rates are likely to be reduced.

The reported access-charge agreement was worked out by an advisory group to the Federal Communications Commission known as the Federal-State Joint Board. The group is scheduled to present its official recommendation to the commission on Nov. 15th.

The reported agreement would allow local telephone companies to reduce access charges up to 35% for a multiline business user who had clear-cut, documented plans for bypassing his local-exchange network. It is not clear, though, whether the reports would have to be approved by state and/or federal regulatory agencies, nor do reports indicate whether the residential and single-line business access charge would be increased after the end of the second year.

MIT names director of Athena

CAMBRIDGE, Mass. — MIT has announced that Dr. Jerome Saltzer, professor of computer science and engineering in the department of electrical engineering and computer science, has been appointed technical director for MIT's Project Athena.

According to a spokesman, Project Athena is a $70 million experiment to determine if the computational and graphics power of microcomputers can be used to enhance the way courses are taught at MIT.

Saltzer will be responsible for the design and implementation of the computer systems environment that Project Athena will create on MIT's campus.

IEEE offers '85 catalog

SILVER SPRING, Md. — The Computer Society of the Institute of Electrical and Electronics Engineers, Inc. (IEEE) said that its 1985 publications catalog is now available.

The catalog features 200 recent titles on a variety of subjects and applications in computer science and engineering. The 28-page publication also lists 45 of the top-selling tutorials available and nearly 60 conference records and proceedings.

The catalog is available free from the IEEE Computer Society Press, Suite 300PR, 1109 Spring St., Silver Spring, Md. 20910.

"First Chicago is launching a whole world of new banking services with **Tandem NonStop Computer Systems.**"

[illegible]
Head, Systems and MIS
First Chicago Corporation
[illegible]

At The First National Bank of Chicago, providing responsive, on-line financial services for our customers is a major corporate priority. An important part of that commitment is the global implementation of core applications on Tandem NonStop Computer Systems.

[illegible] common database structure on systems distributed throughout the world provides immediately useable information, uniquely suited to internal reporting and accounting. Included are such time sensitive items as foreign exchange and money market transactions, loan contracts and SWIFT transfers. We call [illegible] First Chicago International Real-time System for Trans[illegible] [illegible] reporting, and cash management systems, which move billions of dollars for our customers daily. Our Cash Station ATM switch is an excellent example. The [illegible] of the Tandem solution enables us to sustain and improve [illegible] and when they're needed.

The Tandem systems are on-line in sixteen financial capitals around the world. And they are very reliable. We continue to be impressed with the systems, the support and with our employees' enthusiastic acceptance. They are [illegible] service.

The NonStop System

[illegible] market today that can provide an integrated network of up to 255 16-processor systems, [illegible] based environment.

Tandem [illegible] by a worldwide sales, training, service and manufacturing organization.

NonStop Transaction Processing

Computer use coming of age in medical profession

By Bryan Wilkins
CW Washington Bureau

WASHINGTON, D.C.— It appears that doctors are becoming converts to the computer age. The medical industry already makes extensive use of information processing technology and is now poised to introduce new data base applications software that can be commonly used by the medical community.

This was the thrust of the recent eighth annual Symposium on Computer Applications in Medical Care (SCAMC) held here. Dr. Duncan Newhauser of Case Western Reserve University in Ohio told attendees of the conference that the simple application of popular microcomputer-based decision support systems (DSS) is desperately needed for doctors. Noting that information processing is assuming an important place in medicine, Newhauser criticized the lack of computer literacy training being offered by the nation's universities.

"As far as I know, there is not one medical school that requires its students to use or to become familiar with the computer. It is a real shame," Newhauser said.

Newhauser added that the trend toward diagnostic-related groups under recently passed laws and regulations, which are designed to control costs and to require peer group review before operations are performed, have resulted in a situation where information technology is aimed more at the business side of medicine rather than at its practice.

"Hospitals are spending millions on [diagnotic-related group] analysis programs instead of on decision support software that will help a doctor isolate the causes of an illness," he added.

While there is a relatively small supply of efficient DSS programs for physicians, the interest doctors display in the technology is rapidly increasing, according to Dr. George Collins of Buffalo, N.Y., and a member of the American Medical Association (AMA) who also addressed the plenary SCAMC session.

Approximately one in 10 doctors currently has a micro at home. Two in 10 have them in their offices, while micros are easily available in a hospital setting, Collins quoted from an AMA survey.

DBMS highlighted

A exhibit floor at the SCAMC conference highlighted the rapidly growing supply of data base management system (DBMS) programs for the management of patient records, data upgrades and statistical analysis for the medical community that are already available in the office environment.

In the medical profession, a DBMS program that has already attracted wide vendor support is Mumps, a general-purpose interpretive, high-level programming language.

A skeptical view of the role of computers in future medical delivery systems came from Dr. David Rodbard of the National Institutes of Health who said, "Implementation of a computerized approach almost of necessity involves factors such as patient selection, enhanced motivation of patient and staff and the placebo effect of any new or highly touted system."

Other observers noted that development of natural language and artificial intelligence-based programs to aid diagnosis will continue to be produced, but computers will most likely be used in the administration of hospitals and in the handling of patient and statistical data by clinical researchers.

Successful information center starts small, thinks big

Specialist says series of pilot programs paves route to full-fledged center

By Paul Gillin
CW Staff

BOSTON — To gain management approval to build a successful information-center, it is necessary to start small, but have clearly defined procedures as to what is expected from both the information center staff and the end users it serves. That was the message from John Mele, product support specialist at K-Mart Apparel Corp. in North Bergen, N.J., who spoke at TSI International's Information Exchange conference held here recently.

Mele said K-Mart Apparel had successfully built its information center over the last four years by starting with pilot projects in carefully targeted areas and then expanding in scope primarily through word of mouth.

K-Mart Apparel, which does not allow its employees to use microcomputers at work, today supports more than 100 information center users on its mainframe with a staff of five specialists. Mele outlined some dos and don'ts for companies that are planning to set up information centers.

> *K-Mart Apparel, which does not allow its employees to use microcomputers at work, today supports more than 100 information center users on its mainframe with a staff of five specialists.*

He said an information center should:

- Focus on developing end-user training and education programs to make users as self-sufficient as possible.
- Provide direct support to help users code their own applications.
- Act as a buffer to help users better define their requests to MIS.

According to Mele, an information center should not:

- Directly maintain or support applications developed by end users.
- Replace traditional responsibilities. The information center should not attempt to usurp MIS' traditional authority.

Users need to provide certain commitments, too, Mele stressed. Users who want to develop an application using the information center should:

- Promise to provide the personnel and business knowledge necessary to complete a job.
- Commit themselves to completing the required training.
- Take responsibility for cost-justifying the effort.
- Develop, maintain and document their applications.
- Use the available information center software.

Users should promise not to:

- Attempt to breach security regulations.
- Develop major operational systems in the information center.
- Become specialists for other departmental users.

Staff selection should be a top priority, Mele said. Staff members must be patient, diplomatic, organized and possess good communication skills. They must also have a working knowledge of the business and a broad understanding of the tools to be used.

A pilot project for the fledgling information center should be identified, he said. Ideally, the project should be in an area in which automation can provide tangible and measurable benefits. Look for a department that is swamped with work, has mostly manual systems in place and is receptive to the idea of computerization. Too many promises should not be offered at the outset, he stressed.

It is important that MIS understands and approves of the activities of the information center, Mele said. It should be emphasized that the center is working to reduce the application backlog, not to infringe upon MIS territory.

The information center initially needs a statement of purpose, he added. Some of the guidelines outlined above can be used as a start. It should also be determined what services will be offered, what the staff requirements will be and what physical requirements are needed.

Personnel, hardware and software should be in place before the pilot project is undertaken. During the pilot phase, standards and procedures should be developed, user guides written and results of the project measured. Capacity planning and job accounting are necessary parts of the initial activities. The measurements taken at this point will help in planning future projects and further expansion.

DOS/VSE and CICS/VS
SYSTEMS PROGRAMMING CONSULTING

Consultants located in Minneapolis and Washington, D.C. Each consultant has 10-15 years experience in DOS/VS(E) and CICS systems programming. Rates $450 per day plus expenses. Telephone consulting contract also available.

PROGRAM PRODUCTS

Thirty-day free trial available on all products.
Full documentation available on request.
Marketing agents in most countries.

BIM-EDIT—On-line Program Editor
DOS/VSE CICS program editor designed to address recovery, function, performance and ease-of-use problems in ICCF. Includes over 25 features ICCF can't match. $4000 or $200/mo.

BIM-PDQ—POWER/VSE Dynamic Queueing Enhancement
Eliminates 85% of the I/O to the POWER spool queue by satisfying all queue read requests from memory. Dramatic performance improvement. With shared spool support $4000 or $200/mo. Non-shared spooling $2400 or $120/mo.

BIMSPOOL—DOS/VSE POWER to Terminal Printer Spooling
Retrieves batch print from POWER queue, converts and prints on 3270-type terminal printer under CICS. CRT functions may be used to view jobs or control terminal printer operation. 500 users worldwide. $4000 or $200/mo.

BIMSPOOK—On-line to Batch Print Spool
Used by DOS/VSE CICS application programs to create batch print reports. If used with BIMSPOOL, reports may be spooled to terminal printer. $920 or $46/mo.

BIMWINDOW—VTAM Multiple Session Manager NEW
Multiple sessions active at one VTAM 3270 terminal simultaneously. OS: $3600 or $180/mo. DOS: $2400 or $120/mo.

BIMSWAP—CICS BTAM Terminal Switching
Permits local BTAM 3270 CRT's to be switched between DOS CICS partitions without special hardware or extra ports. $1800 or $90/mo.

BIM-ODIS—CICS System Status Display
Summary, detail, and analytic displays of CICS and operating system control blocks. Periodic automatic scan for CICS operational problems. OS: $5000 or $250/mo. DOS: $2600 or $130/mo.

BIMTEXT—Word Processing, Document Composition
Create formatted documents from free-form input. Margin justification, numerous other formatting options. $2600 or $130/mo.

BIMCNSOL—DOS/VSE Multiple/Remote Console NEW
Display-only or full input and display remote console facility at CICS terminal. $2000 or $100/mo full function, $880 or $44/mo display only.

BIMMONTR—DOS/VSE System Status and Queue Display
DOS/VSE system activity, performance measurement, and POWER queue and job display. $1080 or $54/mo.

BIMSERV—DOS/VSE Library and VSAM Catalog Display
Displays directories and entries in all DOS/VSE libraries, VSAM Catalog, Label Area, and VTOC's on CICS CRT's. $1600 or $80/mo.

BIMECHO—CRT Screen Duplication NEW
Copies 3270 CICS output at one CRT to another concurrently for problem determination, and demonstrations. $1600 or $80/mo.

BIMCMPRS—CICS 3270 Data Compression
Reduces 3270 data transmission significantly, improves response time. Available for OS and DOS. $1600 or $80/mo.

BIMP3270—CICS/DOS CRT Screen Print Facility
Several functions related to screen image printing. $800 or $40/mo.

BIMSUBMIT—DOS/VSE Job Submission
On-line job stream editing, storage, and submission under CICS. $1000 or $50/mo.

Info center hailed as harness for corporate micro growth

By Edward Warner
CW Staff

BOSTON — Establishing a corporate information center is the largest single step a firm can take to implement microcomputers strategically, an IBM representative told a group at the East Coast Computerfaire, a personal computer show held here last week.

The information center, according to IBM Marketing Support Representative Nancy Proctor, could function as a "Computerland [store] in your organization" by distributing hardware, software and training to those who need it. It should also provide consultants to users with special applications demands and seek to learn users' needs, but should not stifle creativity, she said.

To accomplish this, Proctor added, the information center will require the commitment of the firm's top leadership. Firms must establish a line of accountability in microcomputer implementations, she said, "so that someone is in charge of what's going on."

Currently, she observed, "if you think of how personal computing has been addressed [in your organization], you may have just thrown up your hands." The users, meanwhile, have been "going out and using their petty cash fund to buy personal computers," she said. Proctor later asked the approximately 30 attendees who heard her speak if their corporations had already established information centers. Three raised their hands.

Top managers, she continued, must show "that they believe productivity is going to be gained" by the implementation of personal computing. To illustrate, she noted that executives in her office schedule all meetings on their terminals — a system so pervasive that those who revert to paper calendars and telephones to set meetings face the ire of their coworkers.

The information center itself should not be staffed with applications programmers, she cautioned, because they cannot talk to users. Instead, Proctor suggested hiring former teachers who, she said, do not think that any questions are dumb and "don't have to achieve [training goals] within an eight-hour time schedule."

Financial justification will need to be tied to any microcomputer implementation, she said, adding that such justification is a problem because improved information flow and decision making "[have] no hard dollars attached to [them]."

An alternative approach to cost justification, she said, might be to "take 5% out of their [office] budget for the year," assuming that amount to be the minimal productivity gain expected. The 5% could then be used by that office for personal computer equipment purchases.

Office systems conference set for Feb. 2-3

ATLANTA — Author and lecturer Hal B. Becker will deliver the keynote speech at the Fourth Annual Office Systems Research Conference Feb. 2-3 at the Omni International Hotel here.

Becker, a Phoenix-based information management consultant, will speak on "Artificial Intelligence: A Fourth Revolution?" His presentation will reportedly explore the early efforts in AI and the transition from expert systems to true AI.

The conference, sponsored by the Office Systems Research Association, will cover computer security, ergonomics and office systems education. Preregistration costs $60 for members, $85 for nonmembers. Registration at the conference costs $70 for members, $95 for nonmembers.

The Office Systems Research Association is located at 574 University Center, Cleveland, Ohio 44115.

Expo to explore agriculture, DP

CHICAGO — The first International Conference and Exposition on Agricultural Automation, sponsored by the Society of Manufacturing Engineers (SME) and the American Society of Agricultural Engineers (ASAE), will be held Feb. 25-28 at the Palmer House Hotel here.

Sessions will cover trends and needs in agriculture, basics of today's food system, basics of robotics as applied in agriculture, automation of food processing, control systems for water and energy management, measuring tools for agriculture and automated harvesting. Automated systems will be exhibited as well.

The registration fee is $350 for nonmembers and $280 for members of SME, ASAE and affiliate organizations. More information can be obtained from either SME at One SME Drive, P.O. Box 930, Dearborn, Mich. 48121; or ASAE, 2950 Niles Road, Saint Joseph, Mich. 49085.

Expert systems seminar set

PROVIDENCE, R.I. — CPMS Expert Systems, Inc. has announced that its seminar on expert systems is scheduled for Dec. 9-12 at the William Penn Hotel here.

The seminar is designed for MIS managers who may know of expert systems but may not understand what they encompass. Seminar chairmen are Saman Hong of RCA Corp. and Kenneth [illegible] of Interface Design Associates, Inc.

Prof. Herbert Simon, Nobel Prize laureate, will present a talk on the partnership of artificial intelligence and operations research and management science. Richard Cyert, former president of Carnegie-Mellon University in Pittsburgh, is scheduled to speak on AI in the corporation of the future.

The registration fee is $950.

CPMS is located at 200 Westminster St., Providence, R.I. 02903.

Meet to discuss benefit plan DP

ORLANDO, Fla. — An educational program for those involved in employee benefit plan data processing will be held at the Buena Vista Palace here Dec. 10-12.

The 1984 EDP Institute, sponsored by the International Foundation of Employee Benefit Plans (IFEBP), will include an introduction to data processing, computer concepts and terminology, development of software, minicomputers, on-line claims adjudication, word processing, auditing DP operations, computer systems control and security, legal ramifications, evaluation and selection of hardware and using computers to communicate benefits.

Registration fees are $420 for IFEBP members and $495 for nonmembers.

More information on the employee benefit meeting is available from IFEBP, P.O. Box 69, Brookfield, Wis. 53005.

International meet to cover micro software

KAUAI, Hawaii — The International Microcomputer Industries Association will hold its International Software Update II at the Waiohai Resort here Feb. 16-20.

Targeted at executives of micro software publishing and developing firms, the conference will include sessions on international vs. domestic standards in software as well as product introduction on an international scale.

Other conference sessions will discuss international product support, success stories in international software sales, the future of silicon software and the impact of IBM's software strategy on international markets.

Scheduled speakers for the international software conference include John Elkins, vice-president of the Naisbitt Group, which performs social forecasting and was founded by John Naisbitt, author of *Megatrends*; Edward Esber, president of Ashton-Tate; Esther Dyson, president of Edventure Holdings, Inc.; and Bill Bowman, chairman of Spinnaker Software Corp.

The full conference fee including accommodations ranges from $1,595 to $1,795 for single occupancy; the fee without accommodations is $995, the sponsor said.

More information can be obtained from International Microcomputer Industries Association, Suite 175, 21 Tamal Vista Blvd., Corte Madera, Calif. 94925.

Comdex/Fall '83 floor scenes

[illegible]

Apple exec's speech to start sixth edition of Comdex/Fall

Organizers expect 1,400 micro, mini vendors to exhibit for an estimated 100,000 attendees Nov. 14-18

LAS VEGAS — More than 100,000 attendees are expected to flood into this desert city for the sixth annual Comdex/Fall '84 small-computer show, opening here Wednesday. The Interface Group, organizers of the show, predicted that over 1,400 vendors will exhibit in more than 7,000 booths during the show, which runs through Nov. 18.

Displays will sprawl across six major facilities: the Las Vegas Convention Center, the Convention Center West Hall, the Las Vegas Hilton, the Riviera, the MGM Grand and Caesars Palace.

A universal draw

Targeted toward computer resellers, the giant show also will draw thousands of people from every other part of the computer industry.

Comdex officially kicks off with a keynote address by John Sculley, president and chief executive officer of Apple Computer, Inc., who will discuss marketing challenges in the hotly competitive small-computer arena. Following the address, which begins at 9:30 a.m. at the Las Vegas Hilton, all exhibit halls will open their doors by 10:30 a.m.

Opening three months to the day after IBM unveiled the Personal Computer AT, Comdex/Fall '84 is expected to feature the first AT-compatible systems.

A tremendous flurry of microcomputer and minicomputer products arrives each year at Comdex. Among the crop taking their first public bow at Comdex are the Graphics Environment Manager (GEM) operating environment software from Digital Research, Inc., Microsoft Corp.'s MS-DOS networking software and the Wordstar 2000 line from Micropro International Corp.

A no-show

Another package in the spotlight, the Lotus Development Corp. productivity software for the Apple Macintosh, which is scheduled for announcement today, will be shown privately, as Lotus decided against a Comdex exhibit.

Other vendors, meanwhile, will display the growing choices in Macintosh packages now available for sale.

At other software exhibits, showgoers will be able to examine several integrated productivity packages running under versions of AT&T's Unix. New graphics software products for the IBM Personal Computer family also should draw high interest.

Opening three months to the day after IBM unveiled the Personal Computer AT, Comdex/Fall is expected to feature the first AT-compatible systems. In the wake of another August IBM move, the introduction of the PC Network, local-area networks also will maintain a high profile at Comdex, with new network system software supplemented by multiuser network applications from a number of vendors.

In another move toward distributed data processing, several suppliers of time-shared multiuser systems will introduce methods to link single-user microcomputers or intelligent workstations to their larger systems, with the single-user machines acting either as local-area network nodes or as terminals.

Also on the multiuser front, enhancements for the Personal Computer AT that extend the system's capability beyond three users will surface at the show, as will a host of new time-shared machines from established vendors such as Altos Computer Systems, Inc. and Plexus Computers, Inc.

Microcomputer hard disk storage capacities keep creeping up, with one example being the 30M-byte drives now available for Compaq Computer Corp.'s Deskpro series. A host of new external hard disk drives and tape storage systems for single-user or multiuser systems will be unveiled at Comdex, including several 3½-in. Winchester disk drives.

Comdex should feature dozens of printer and plotter introductions, including a desktop eight-page per minute laser printer from Digital Equipment Corp.

In the add-on category

Among new add-on products designed for IBM Personal Computers and compatibles, Comdex is expected to showcase board products that convert a Personal Computer XT to a Personal Computer AT-compatible system.

Other add-ons will give enhanced communications abilities (with a trend toward voice-management features) and boosted graphics functions.

In addition to the exhibits, Comdex will feature 43 sessions covering marketing and technological aspects of computer reselling.

For more information, the Interface Group can be reached at 330 First Ave., Needham, Mass. [illegible]

Comdex/Fall four-day schedule of events

Comdex/Fall '84 opens Wednesday, Nov. 14, and runs through Sunday, Nov. 18.

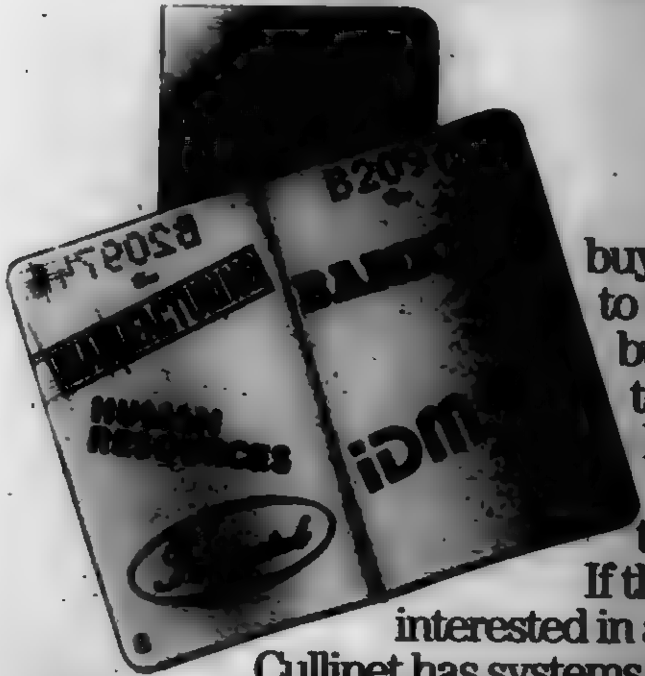
Exhibits will be open at the Las Vegas Convention Center, Convention Center West Hall and Las Vegas Hilton from 10:30 a.m. to 6 p.m. on Wednesday and from 10 a.m. to 6 p.m. Thursday through Sunday.

Other exhibits will be open at Caesars Palace, the MGM Grand and the Riviera during the following times: Wednesday, 9 a.m. to 5 p.m.; Thursday through Saturday, 8:30 a.m. to 6 p.m.; Sunday, 8:30 a.m. to 5 p.m.

The fee for the full conference plus five days of admission to exhibits is [illegible]. [illegible]

[illegible]

With Cullinet applications, there are no boundaries to what your company can accomplish.



It's an all too common problem. Manufacturing buys an application, and data processing is expected to integrate it with the corporate database. Finance buys an application, and data processing is expected to integrate it, too. And so it goes. Three years later, the job still isn't finished. And the ideal of a *true* database management system is still just that—an ideal.

If this problem sounds at all familiar, you'll be interested in a way to avoid it altogether—Cullinet.

Cullinet has systems in four application areas—financial, manufacturing, human resources management and banking. Each is a functionally superior product in its own right—which, of course, is a primary concern to the people who use them.

Even more important, each is built on the same foundation—our IDMS/R database. Through it, each is able to share data with every other Cullinet application. And that's something no one will appreciate as much as data processing.

By eliminating the boundaries between modules, we've eliminated the problems typically associated with applications software—duplicate data, multiple updates, file conversion and the like. The result: efficient processing throughout the company.

And if this integrated approach is the main advantage, consider also that our applications were built using ADS/OnLine, our powerful fourth generation language. This makes them easy to install and tailor.

For more information about our applications and our complete approach to information management, attend a Cullinet Seminar. You can make arrangements by sending in this coupon, or by calling, toll-free, 1-800-225-9930. In MA, phone 617-329-7700.

The Complete Software Solution

Cullinet: I'd like to learn more about your applications. Please arrange for me to attend a Cullinet Seminar.

Comdex/Fall '84

AMERICAN BUSINESS SYSTEMS, INC.
Booth 1579

American Business Systems, Inc., will exhibit Bacs Bridge, a report writer that is said to allow users to access data and transaction files in the company's Bacs accounting modules and transfer data directly to data base, spreadsheet and graphics packages.

The product offers up to 20 columns per report, and users can screen displays and print reports up to 160 char. wide, according to the company.

Bacs Bridge is available under PC-DOS. The price of the product is $900.

American Business Systems, 3 Littleton Road, Westford, Mass. 01886.

ANCHOR AUTOMATION, INC.
Booth M1118

Anchor Automation, Inc. will display its Volksmodem 12, an AT&T 103/212A-compatible modem designed for most computers and standard software.

Volksmodem 12 is designed for unattended 300 or 1,200 bit/sec operation and features serial command operation, full- or half-duplex operation, autodial and autoanswer, tone and pulse dialing, dial tone detect, busy detection and attendant headset jack. It costs $299.

Anchor Automation, 6913 Valjean Ave., Van Nuys, Calif. 91406.

ANDERSON JACOBSON, INC.
Booth 2124

Anderson Jacobson, Inc. will feature a desktop computer with one flexible disk drive and one 10M-byte hard disk drive.

The system is designed for integrated application programs written for the IBM Personal Computer XT and compatible personal computers. It is priced at $4,895.

Among other Anderson Jacobson products that will be displayed are a security modem with computer logon and two-level password security, an option board said to eliminate errors for asynchronous, full-duplex, two-wire, dial-up transmission at 4,800 bit/sec over the switched telephone network and a series of leased-line modems and multiplexers.

The AJ 1212-AD2 security modem is priced at $695. The error correction board is $595. The statistical multiplexers range from $1,850 to $7,050. The leased-line modem is $2,545 with autodial backup.

Anderson Jacobson, 521 Charcot Ave., San Jose, Calif., 95131.

AST RESEARCH, INC.
Booth W960

AST Research, Inc. will feature several new and existing products. It will unveil a single-slot board for users of Apple Computer, Inc. Apple IIe microcomputers priced at $235.

The company will also introduce its new line of mass storage subsystems, named Colossus and priced at $7,490 with a host adapter. A micro-to-mainframe package, 5252-11, will be displayed; it costs $995. Also featured will be a half-card modem called Reach, priced at $549, and a monochrome display card, Preview, which costs $390.

AST Research, 2121 Alton Ave., Irvine, Calif. 92714.

CAL-ABCO
Booth 1442

Cal-Abco will introduce the Legend 1380 — the latest in the company's 80 Series of dot matrix printers. IBM Personal Computer-compatible, the printer is rated at 130 char./sec and includes a 2K-byte buffer. A dip-switch panel controls several features, including condensed print, line spacing and double-strikes.

The printer produces 96 downloadable characters using a nine-wire print head and 1/216 line spacing to achieve high-resolution graphics.

The Legend 1380 is priced at $379.

Cal-Abco, 6041 Variel Ave., Woodland Hills, Calif. 91367.

CDEX CORP.
Booths W968 and W1067

Cdex Corp. will introduce two additions to its Business Application series: Analyzing Sales Performance Using Electronic Spreadsheets and Building a Business Plan Using Electronic Spreadsheets.

Each package runs on the IBM Personal Computer, Personal Computer XT, Personal Computer AT and compatibles, PCjr and Apple Computer, Inc. machines under IBM's PC-DOS, Microsoft Corp.'s MS-DOS, the UCSD P-System, Apple's Appledos 3.3 and Applesos and Tandy Corp. TRS-DOS operating systems.

Versions will be available for Lotus Development Corp.'s 1-2-3 and Symphony, Microsoft's Multiplan, Software Arts, Inc.'s Visicalc and Sorcim Corp.'s Supercalc. The packages, also available for the Apple IIe in versions for all of the above except 1-2-3, are priced at $69.95.

Cdex, Suite 200, 5050 El Camino Real, Los Altos, Calif. 94022.

MEET
THE SYSTEM
THAT MAKES
BORDERLESS
FACT.
NOT FANTASY.
INFORMATION
EXPERT™

Borderless. ■ You've heard the word enough. And until now, that's all it's been. A word. Not reality. ■ But Management Science America has changed that for good. ■ Introducing Information Expert™ (I.E.). The new mainframe software tool that gives you the level of system integration that some companies have been promising. But not delivering. ■ I.E. is truly borderless. ■ It removes the barriers between systems. Between the individual user and accounts receivable. And accounts payable. And general ledger. And more. So that the individual user can retrieve information and design reports from several application programs at once, even if they aren't all MSA programs. Simply and quickly. At one online terminal. ■ And I.E. is designed to

Comdex/Fall '84

COMMON LANGUAGE SYSTEMS, INC.
Booth C1523

Common Language Systems, Inc. will introduce its Plain English programming language for computers operating under AT&T's Unix and Microsoft Corp.'s Xenix.

The language reportedly masks many of the technical aspects of Unix, allowing novice programmers to more easily develop applications software and enabling experienced programmers to more rapidly produce multiuser programs.

Common Language Systems will also display its version of Plain English for IBM PC-DOS and Microsoft MS-DOS-based microcomputers. The PC-DOS and MS-DOS version of Plain English is priced at $595. The Unix/Xenix version, which supports up to eight users, costs $1,295.

Common Language Systems, 100 E. Sybelia Ave., Maitland, Fla. 32751.

COMPUPRO SYSTEMS, INC.
Booth H7206

Compupro Systems, Inc. will introduce the Compupro 286 16-bit multiuser business system based on the Intel Corp. 80286 microprocessor and featuring 8-bit slave processing capabilities. The 286 comes standard with 512K bytes of main memory and a slave processing unit with Zilog, Inc. Z80 microprocessor, 64K bytes of random-access memory, one serial port, an 800K-byte 5¼-in. floppy disk drive, a 40M-byte hard disk, one parallel and one Centronics Data Computer Corp.-type printer port and four serial ports.

A four-user system costs $9,995.

Compupro Systems, 3506 Breakwater Court, Hayward, Calif. 94545.

DATACOPY CORP.
Booth H7517 (Hilton)

Datacopy Corp. will introduce its Model 700 Word Image Processing System office image processor. The company's Word Image Processing System and Character Image Recognition software integrates word processing and data base management capabilities with an image scanner.

The system allows office workers to process images, build documents and convert images or text to standard computer code for use with word processing software. The Model 700 features electronic half-toning, image editing and character-recognition capabilities. It costs $3,950.

Datacopy, 1215 Terra Bella Ave., Mountain View, Calif. 94043.

DIGITAL PATHWAYS, INC.
Booth 8326

Digital Pathways, Inc. will introduce two software packages for the IBM Personal Computer. The Soundware series of software is said to allow an IBM Personal Computer XT to perform intelligent telephone answering and management activities and other voice communications functions. A second package, Disk Preventative Maintenance (Disk P.M.) is said to perform preventive maintenance on hard and floppy disks for IBM Personal Computers and compatible machines. Disk P.M. is priced at $49.95, and the Soundware series is priced at $449.

Digital Pathways, 1060 E. Meadow Circle, Palo Alto, Calif. 94303.

EASTMAN KODAK CO.
Booth W606

Eastman Kodak Co. will introduce a line of floppy diskettes. The company will display its low-density 5¼-in. diskettes with storage capacities of 0.25M to 1M byte; its high-density 5¼-in. diskettes with storage of 1.6M or 3.3M bytes; and 3.5-in. diskettes with 0.5M bytes of storage.

The diskettes range in price from $3.85 each for the low-density models to $16.50 for the high-density models.

Eastman Kodak, 343 State St., Rochester, N.Y. 14650.

ERICSSON INFORMATION SYSTEMS
Booth M916

Ericsson Information Systems will announce the Ero-Intelligent line of IBM Personal Computer-compatible microcomputers based on the Intel Corp. 8088 microprocessor. The product has an ergonomic design incorporating enlarged alphanumeric keys, nonglare monitor and an adjustable display stand.

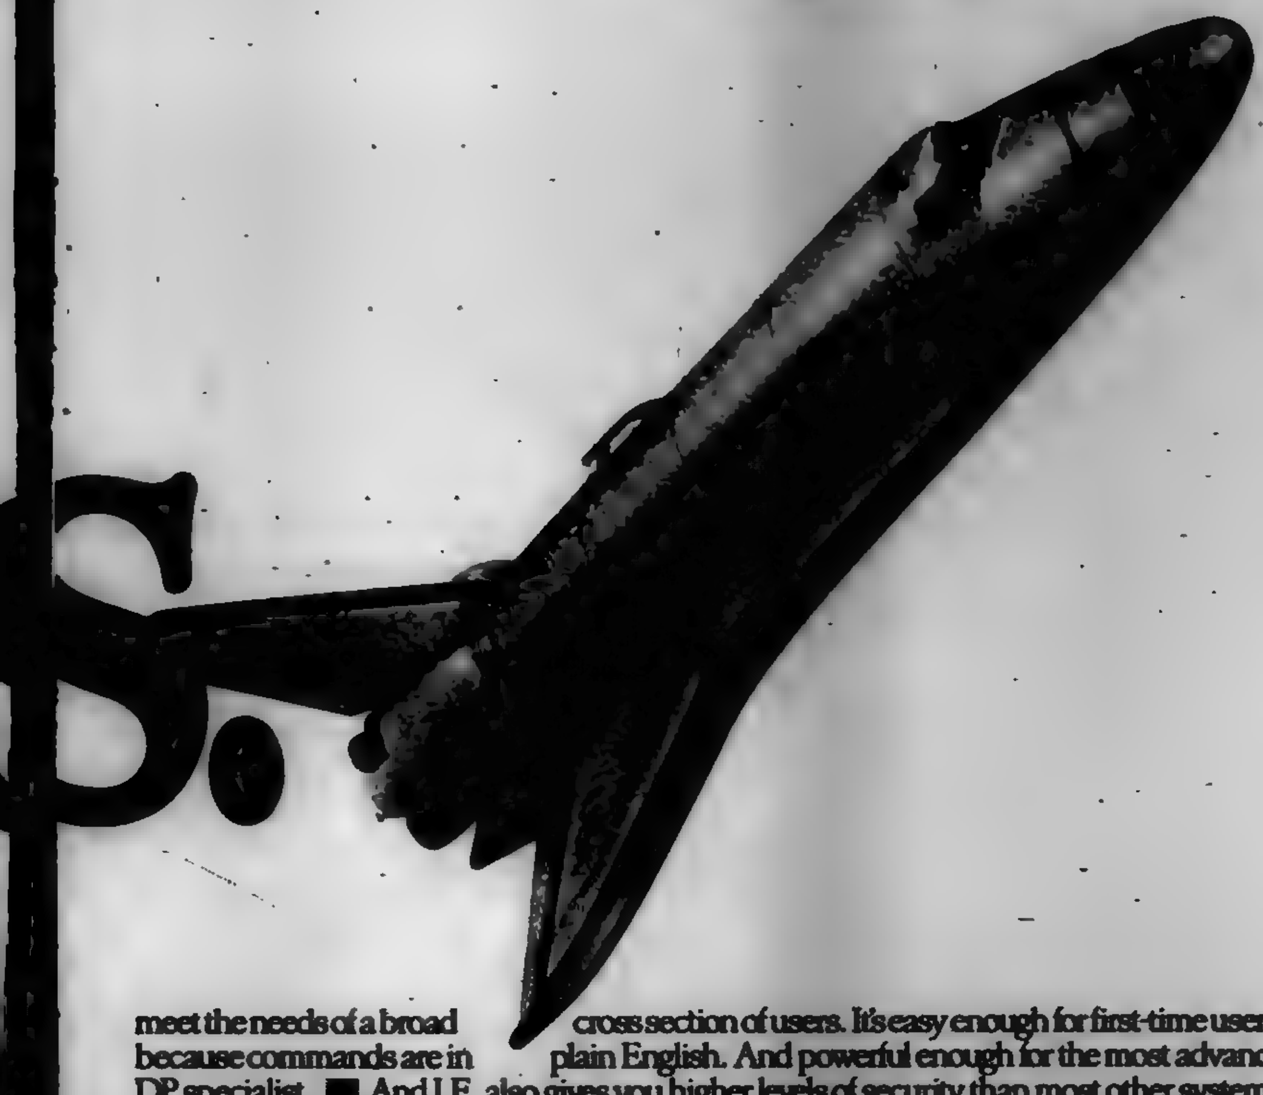
A 12-in. monochrome or color monitor is available. Interfaces include one RS-232 serial port and one Centronics Data Computer Corp.-type parallel port.

The price for the Ero-Intelligent micro with 256K bytes of random-access memory, monochrome monitor and dual-floppy disks with 360K bytes of storage is $3,295, the company said.

The price with 10M bytes of hard disk storage is $5,230, the company said.

Ericsson Information Systems, P.O. Box 2522, Greenwich Office Park 1, Greenwich, Conn. 06836.

MSA WE ADD THE GENIUS TO COMPUTERS.™
The Software Company



meet the needs of a broad cross section of users. It's easy enough for first-time users—because commands are in plain English. And powerful enough for the most advanced DP specialist. ■ And I.E. also gives you higher levels of security than most other systems. ■ Only MSA gives you I.E. ■ It's a giant technological step into the future from the company that has quietly led the way in application software development. It will now be a part of all software MSA provides. The result of 3½ years of intense research and development, it's the tool that has taken the concept of total "system integration" out of the realm of theory and into the realm of fact. ■ To find out more about I.E., contact Robert Carpenter at (404) 239-2000. ■ Management Science America, Inc., 3445 Peachtree Road, N.E., Atlanta, Georgia 30326. ■ I.E. from MSA. ■ It's one more way we're adding the genius to computers. ■ Today and tomorrow. ■ ©1984, Management Science America, Inc.

Comdex/Fall '84

FALCO DATA PRODUCTS, INC.
Booth 1301

Falco Data Products, Inc. will show its Fame II terminal with a Digital Equipment Corp. VT102 emulation option. The smart terminal is based on Ansi X3.64 standards with a 14-in. screen, IBM Selectric-style keyboard correction key, 50 nonvolatile user-programmable function keys and the ability to use double-wide and double-high characters.

Fame II costs $595.

Falco Data Products, 1286 Lawrence Station Road, Sunnyvale, Calif. 94089.

GENERAL POWER SYSTEMS
Booth 2365

General Power Systems will display its Memorygard II series of standby uninterruptible power systems. The series, said to feature 2-msec switching capabilities and internal battery times ranging from 15 to 18 minutes, includes 200W, 300W and 1-kVA models.

Pricing for the 200W model begins at $595 and for the 300W model at $695. Prices for the 1-kVA model begin at $1,295.

General Power Systems, 1400 N. Baxter St., Anaheim, Calif. 92806.

GOLD STAR ELECTRONICS INTERNATIONAL, INC.
Booth 4149

Gold Star Electronics International, Inc. will introduce eight new display monitors for a variety of home, hobby and office uses. Five monochrome models range from a medium-resolution, 9-in. amber composite signal input video display to a 12-in. amber, high-resolution (1,100 lines) transistor-to-transistor logic input video display.

Three color models range from a 12-in. low-resolution composite video display, to a 13-in. high-resolution (0.31mm dot pitch) model. Prices range from less than $150 for the basic monochrome model to less than $600 for the high-resolution color model.

Gold Star Electronics International, 1050 Wall St. W., Lyndhurst, N.J. 07071.

Not just graphics...
Genigraphics presentation power turns companies on.

GRAPHIC SOFTWARE SYSTEMS, INC.
Booth S8732

Graphic Software Systems, Inc. will show its chart-making software package aimed at the large corporate market. GSS-Plottalk runs on microcomputers under IBM's PC-DOS, Microsoft Corp.'s MS-DOS and most versions of AT&T's Unix operating systems.

The software features free-format English commands to create presentation-quality charts and produce all major data representation chart types.

It requires 256K bytes of memory and needs graphic support software drivers for device independence. The software is available to OEMs and costs $150.

Graphic Software Systems, 25117 Southwest Pkwy., Wilsonville, Ore. 97070.

ISOTRON, INC.
Booth CT716

Isotron, Inc. will display two new lines of its Ohio Scientific microcomputers, the 235 series and 345 series.

Both computers utilize 5¼-in. hard disk technology. The 235 can accommodate from two to four users, while the 345 series is expandable to eight users.

Prices begin at $6,695 for the two-user Model 235 G 2 and under $10,595 for the Model 345 I.

Isotron, 140 Sherman St., Fairfield, Conn. 06430.

I³ INTERFACE, INC.
Booth H7245

I³ Interface, Inc. will be exhibiting five new storage products for the IBM Personal Computer and compatibles market.

IBM-formatted storage capacities of 55.7M, 87.7M and 119.7M bytes in I³'s external disk systems series include a 5¼-in. Winchester disk drive, controller, cabinet, power supply, I/O adapter and cable.

The I³Inth10, a 5¼-in. half-height internal disk system, has a 10M-byte formatted storage space with a data transfer rate of 5M bit/sec. The final product is I³TAP, a 5¼-in. half-height cartridge tape system that gives the user from 10M bytes to 60M bytes of formatted storage and includes a connector, cable, floppy interface and host adapter.

The external disk systems range from $5,200 to $7,900; the I³Inth10 internal disk system is $1,095; and the I³TAP tape system is priced at $1,045.

I³ Interface, 21101 Osborne St., Canoga Park, Calif. 91304.

Comdex/Fall '84

LIBERTY ELECTRONICS CO.
Booth H7536 (Hilton)

Liberty Electronics Co. will introduce two graphics terminals — the Freedom 240 Graphics/Ansi VDT and the Freedom 210 Graphics/Ascii VDT. The Freedom 240 is Digital Equipment Corp. VT220- and VT100-compatible, and is compatible with Tektronix, Inc. 4010 and 4014 graphics terminals. The Freedom 210 is compatible with Liberty Electronics' Freedom 200 VDT and emulates the Televideo Systems, Inc. 950 and Tektronix 4010 and 4014 terminals.

Both products offer 14-in., 132-col. alphanumeric display standards and feature 665- by 288-pixel resolutions. The Freedom 240 is priced at $1,395 and the Freedom 210 at $1,295. Both are scheduled for limited shipment in December and general release in January.

Liberty Electronics, 625 Third St., San Francisco, Calif. 94107.

MATRA COMMUNICATION, INC.
Booth 3126

Matra Communication, Inc. will exhibit its Scanset line of executive voice and data workstations. Scansets are desktop terminals that provide access to internal or external data bases.

A Scanset model with a built-in telephone handset for simultaneous voice and data capabilities is priced at $1,400, according to a vendor spokesman.

Matra Communication, 20705 Valley Green Drive, Cupertino, Calif. 95014.

MCBA, INC.
Booth 2121

MCBA, Inc. will feature the first nine packages in its line of manufacturing, distribution and accounting software running on the IBM Personal Computer XT under IBM's PC-DOS operating system.

The packages include accounts payable, accounts receivable, bill of materials processor, customer order processing, fixed assets and depreciation, general ledger, inventory management, payroll and purchase order and receiving.

Prices for the packages range from $700 to $1,500 per module, the vendor said.

MCBA, 2441 Honolulu Ave., Montrose, Calif. 91020.

NESTAR SYSTEMS, INC.
Booth 4758

Nestar Systems, Inc. will demonstrate features of its local-area network products, the Plan 3000 and Plan 4000 series, which offer microcomputer, minicomputer and mainframe computer networking capabilities and include IBM's Systems Network Architecture gateway technology.

Prices of the Plan 3000 range from $10,000 to $15,000 and for Plan 4000 range from $20,000 to $40,000, according to the vendor.

The company will introduce a print server in the Plan 1000, the newest member of the Plan family, which will be driving Hewlett-Packard Co.'s laser printer and HP's Model 7550A color plotter. The price of the Plan 1000 products will range from $1,000 to $3,000, and the exhibited print server costs $1,995.

The company will also exhibit enhancements to IBM's PC Network products — Nestar's broadband network with IBM broadband and IEEE-802 broadband-compatible nodes. The broadband network gateway hub in a six-port configuration is $1,000.

Nestar will show its Planpak Multiuser Applications for several packages: Ashton-Tate's Dbase II; Sorcim Corp.'s Supercalc III and Superwriter; Software Connections, Inc.'s LAN:Mail Monitor and LAN:Datastore, which are bundled in the Plan 3000 and Plan 4000 series; Micro Data Base Systems' multiuser MDBS III; Cosmos, Inc.'s Revelation; and Information Builders, Inc.'s PC Focus.

Nestar Systems, 2585 E. Bayshore Road, Palo Alto, Calif. 94303.

NOVELL, INC.
Booth 3244

Novell, Inc. will unveil Advanced Netware 1.0, said to link separate local-area networks using multiple file servers and network bridges.

Advanced Netware reportedly allows simultaneous use of files from file servers on different networks, including Datapoint Corp.'s Arcnet, Corvus Systems, Inc.'s Omninet, Xerox Corp.'s Ethernet and IBM's PC Network, among others.

The product will support workstation access to as many as eight file servers simultaneously, according to the vendor. Advanced Netware is said to provide improvements in network functionality and reduced record locking. Pricing begins at $1,495.

Novell, 1170 N. Industrial Park Drive, Orem, Utah 84057.

OKIDATA
Booth 3300

Okidata will exhibit two printers, the full-color Okimate 20, and the Microline 182 dot matrix printer. The

Continued on page 32

WHAT THEY CALL A PORTABLE, WE CALL A LOAD.

Today, almost everyone claims to have a portable computer. The problem is, almost no one does. Most portables have a separate data storage device, separate printer, separate modem, and some even require a separate monitor or bulky battery pack that can make them a liability on the road.

The Sharp PC-5000, on the other hand, is a true portable. It's a compact 16 bit, 128K microprocessor (expandable to 320K) with 192K of ROM, an 80 character display screen, removable bubble memory storage, built-in rechargeable power source and bundled software. It's also available with options like an integrated modem that lets you connect with your mainframe and an integrated correspondence-quality printer which doesn't increase the size of the system. And even with all these features, the PC-5000 fits neatly into a briefcase and weighs under 14 pounds. Almost 25% less than its nearest major competitor. At a price that's lighter, too.

Of course, there's one thing about the PC-5000 that isn't small. Its working capacity. It functions as a desktop computer. And is compatible with a wide variety of MS-DOS* software.

So if you need a truly portable computer, look into the Sharp PC-5000. The one that may be the smallest, lightest—and the best value for the money. In short, a computer that will lighten your work load. Not add to it.

For more information call 1-800-BE-SHARP or fill in the coupon.

MS-DOS* is a registered trademark of Microsoft Corporation.

Comdex/Fall '84

Continued from page 31

Okimate 20 uses a standard parallel interface and an IBM-compatible interface, allowing the machine to emulate the IBM 5251 graphics terminal.

The product is said to include a 24-element print head and works at speeds of 80 char./sec for draft type and 60 char./sec for correspondence-quality type.

The Microline 182 reportedly uses a standard Centronics Data Computer Corp. interface and works at speeds of 120 char./sec.

The Okimate 20 sells for $268, and the Microline 182 sells for $299, the vendor said.

Okidata, 532 Fellowship Road, Mount Laurel, N.J., 08054.

PLEXUS COMPUTERS, INC.
Booth 2388

Plexus Computers, Inc. will unveil its one- to eight-user Plexus P/15 32-bit supermicrocomputer designed to run on AT&T's Unix. The P/15 features two Motorola, Inc. 68010 microprocessors, a memory capacity of up to 2M bytes and eight full-duplex serial ports for terminals or other peripherals.

The P/15 allows for up to 54M bytes of disk storage in two Winchester-type disks, plus a single 5¼-in. double-sided, double-density floppy disk, and uses standard 115-Vac power. The I/O processor handles all character I/O to and from the eight serial ports.

The price of the P/15 is $10,950 with 500K bytes of random-access memory and 12M bytes of Winchester disk storage, plus a 1M-byte floppy disk drive.

Plexus Computers, 3833 N. First St., San Jose, Calif. 95134.

PRENTICE-HALL, INC.
Booth W906

Prentice-Hall, Inc. will display tutorial books and software published under a joint venture with IBM, as well as its Profit Center accounting software and Skiwriter II word processing software.

The tutorials deal with popular software packages such as Ashton-Tate's Dbase II and are priced from $29.95 to $39.95.

Three modules for the Profit Center will be introduced: Job Cost, priced at $695; Job Estimator, priced at $395; and Information Query, a general accounting report manager priced at $250. The Profit Center runs on the IBM Personal Computer family and compatibles, on the Texas Instruments, Inc. TI Professional and Wang Laboratories, Inc. Personal Computer.

Skiwriter II costs $99 and is designed for the IBM Personal Computer and IBM PCjr.

Prentice-Hall, Englewood Cliffs, N.J. 07632.

PRINTEK, INC.
Booth 1101

Printek, Inc. will display its Model 935 printer, which the company said will operate with most microcomputers.

The printer features a nine-wire print head and offers a high-resolution 36- by 18-char. matrix. It uses a dual-pass, single-return, unidirectional printing method with the head shifting on second pass to produce better quality in executive-quality or letter mode, according to the vendor. It features dual speeds, with both traction and friction feed, and it can perform medium and high-density graphics and data processing with spreadsheets of up to 220 columns and using up to 16-in. paper.

The Model 935 printer is priced at $1,695.

Printek, 1517 Townline Road, Benton Harbor, Mich. 49022.

QUADRAM CORP.
Booth [illegible]

Quadram Corp. will show several expansion products for the IBM Personal Computer, Personal Computer XT and PCjr.

Maxpaq is a memory expansion card for the short slot of the IBM Personal Computer XT. A 384K-byte card is $595.

Quadsprint, an enhancement board to upgrade the IBM Personal Computer and Personal Computer XT, is priced at $645.

The Quadmemjr expansion card for the PCjr provides an additional 128K to 512K bytes of memory at $275.

The Quadjr Expansion Chassis provides 360K-byte floppy disk drives for the PCjr and is priced at $895.

The Quadjr Memory Board, for use with the Quadjr Expansion Chassis, comes with 128K bytes of memory installed and is socketed for up to 384K bytes. It is priced at $275.

The Two Meg Card memory expansion card for the Personal Computer or Personal Computer XT provides 2M bytes of memory and is priced at $3,495, fully loaded.

Palette Master is a high-resolution color graphics adapter for photo-like images. It is priced at $695.

The Quadtape line of four internal or external streaming tape products ranging from 20M- to 60M-byte capacities is priced from $1,395 to $1,895.

Quadram, 4355 International Blvd., Norcross, Ga. 30093.

SOFTWARE SOLUTION

IBM/PC* or XT*| Plus Compatibles and Popular MS-DOS** Micros.

TEMPUS-LINK & TEMPUS-DATA

Tempus-Link and Tempus-Data are highly advanced, yet easy to use tools for corporate micro and mainframe computer users. Their synergy and flexibility meet the needs of both non-technical and expert users.

Tempus-Data's dictionary provides security and access management at the field level for all specified databases and mainframe files. This access restriction is personalized to each micro user.

Tempus-Data can be used on-line to provide quick response to your high-priority requests. Yet, precious mainframe resources can be conserved by deferring less pressing requests to batch mode execution.

Tempus-Link and Tempus-Data's Open Architecture allows DP experts to build complex micro applications where mainframe access is totally transparent to the micro user, and this from virtually any user-designed and packaged micro application.

Tempus-Link's unique virtual disk system gives Tempus-Data users direct on-line and batch access to files stored on their mainframes but written in micro formats such as CSV and DIF**. Information Management and Data Control suddenly becomes simplified to DP professionals because micro files are now read and written in micro format through existing mainframe resources and even without tricks.

Micro Tempus recognises that high-quality corporate information is a time-sensitive commodity. Its integrated approach assures that the data provided to the micro user can be kept in synch with the mainframe's version.

Tempus-Link and Tempus-Data from Micro Tempus – a modest investment in personal productivity – a cornerstone in developing the office of the future today.

SANYO BUSINESS SYSTEMS CORP.
Booth 803, West Hall

Sanyo Business Systems Corp. has announced the MBC 775 Portable Computer, which is compatible with the IBM Personal Computer.

The MBC 775 features an Intel Corp. 8088 microprocessor, Microsoft Corp.'s MS-DOS operating system, 256K bytes of main memory, two 360K-byte, 5¼-in. floppy disks, a 9-in. monitor and Centronics Data Computer Corp.-type port. The price for the MBC 775 is $2,599, the vendor said.

Sanyo, P.O. Box 387, 51 Joseph St., Moonachie, N.J. 07074.

SEAGATE TECHNOLOGY, INC.
Booth 4206

Seagate Technology, Inc. will reportedly introduce a number of Winchester disk drives.

They will include a 10M-byte formatted, 3½-in. Winchester disk drive priced at under $450 in OEM quantities of 1,000 or more; and a 20M-byte formatted, half-height, 5¼-in. disk drive, priced at $525 in quantities of 1,000 or more.

Also featured will be the ST 4000 series of Winchester disk drives, ranging in capacity from 20M to 40M bytes and ranging in price from $730 to $975 in OEM quantities of 1,000 or more.

Seagate Technology, 920 Disk Drive, Scotts Valley, Calif. 95066.

SOFTRAN CORP.
Booth 932

Softran Corp. will feature a multiuser accounting system designed for IBM's Personal Computer AT.

The software, which consists of six modules — accounts receivable, accounts payable, inventory, payroll, sales order and general ledger — will run under Microsoft Corp.'s Xenix 3.0.

Price of the multiuser system is $795 per module.

Softran, 153 Pierrepont St., Brooklyn Heights, N.Y. 11201.

'Polly wants a password.'

STM ELECTRONICS CORP.
Booth A900

STM Electronics Corp. will unveil its upgraded portable personal computer that provides two-way communications between field personnel and their corporate data bases.

STM added an internal 1,200 bit/sec modem to its STM Personal Computer, which has a 25-line by 80-line LCD and is memory upgradable to 512K bytes. The machine weighs 17 lbs.

The price of the upgraded machine is $3,799, STM Electronics said.

STM Electronics, 535 Middlefield Road, Menlo Park, Calif. 94025.

SUPPORT SYSTEMS INTERNATIONAL
Booth [illegible]

Support Systems International will exhibit the full line of computer cables, desktop data switches and related computer products it manufactures.

Support Systems' product line incorporates a full range of interconnect hardware for microcomputers, minicomputers and mainframes, according to the firm.

The company will display its line of Federal Communications Commission-standard double-shielded cables, standard shielded cables and products for computer installations that include rack-mountable junction and patch panels, rack cabinets, breakout boxes, pocket cablers, bulk plenum and cable and connectors, a spokesman said.

Support Systems will also introduce Micro-Match, a product designed and updated by Command Computer Corp. of Philadelphia.

Micro-Match is said to provide instruction on interfacing microcomputers to printers, CRTs, modems and plotters; micros to minis; and micros to mainframes.

Micro-Match provides pin-to-pin cable designs, switch-setting diagrams and jumper configurations.

The price for the Micro-Match service is $690 per year, the vendor said.

Support Systems International, 150 S. Second St., Richmond, Calif. 94804.

TALUS CORP.
Booth C84

Talus Corp. will introduce the Talus Image Management System, which incorporates the T20/20 Personal Computer Image Scanner; the T20/22 Image Converter Board; and Talscan Image Management software.

The products are intended for use with the IBM Personal Computer, Personal Computer XT and compatible machines, the company said.

The price of the T20/20, which offers 200- by 200-pixel resolution, is $4,995, according to the vendor.

The T20/22 Image Converter Board is a standard-size, Personal Computer XT printed-circuit board that features direct memory access for disk storage of images. Approximately 200 standard-size pages can be stored on a 10M-byte Winchester disk, the company said.

The price of the T20/22 is $1,295, according to Talus.

Talus, 985 University Ave., Los Gatos, Calif. 95030.

TRW, INC.
Booth 873

TRW, Inc.'s customer service division will feature various service offerings to resellers and users of microcomputer products.

The company's latest service, named Product, is a mail-in program designed for the repair of Winchester drives and diskette drives, the vendor said.

The company will also demonstrate the features of its service programs designed for distributors and value-added resellers, according to a spokesman.

TRW, 15 Law Drive, Fairfield, N.J. 07006.

UNIFY CORP.
Booth [illegible]

Unify Corp. will demonstrate the recently approved Independent Software Information Standard (Isis). Isis is a standard software interface for third-party applications using the AT&T Unix operating system.

Developed in part by Unify President Nicholas Nierenberg, Isis has been implemented on AT&T Information Systems 3B2 microcomputers running on the Unix operating system. It reportedly gives users access to integration of applications software packages.

Unify, 4000 S.W. Kruse Way, Lake Oswego, Ore. 97034.

NTIS software directory out

SPRINGFIELD, Va. — Five-hundred programs developed by more than 100 federal government agencies are listed in the 1984 edition of the *Directory of Computer Software* published by the National Technical Information Service (NTIS).

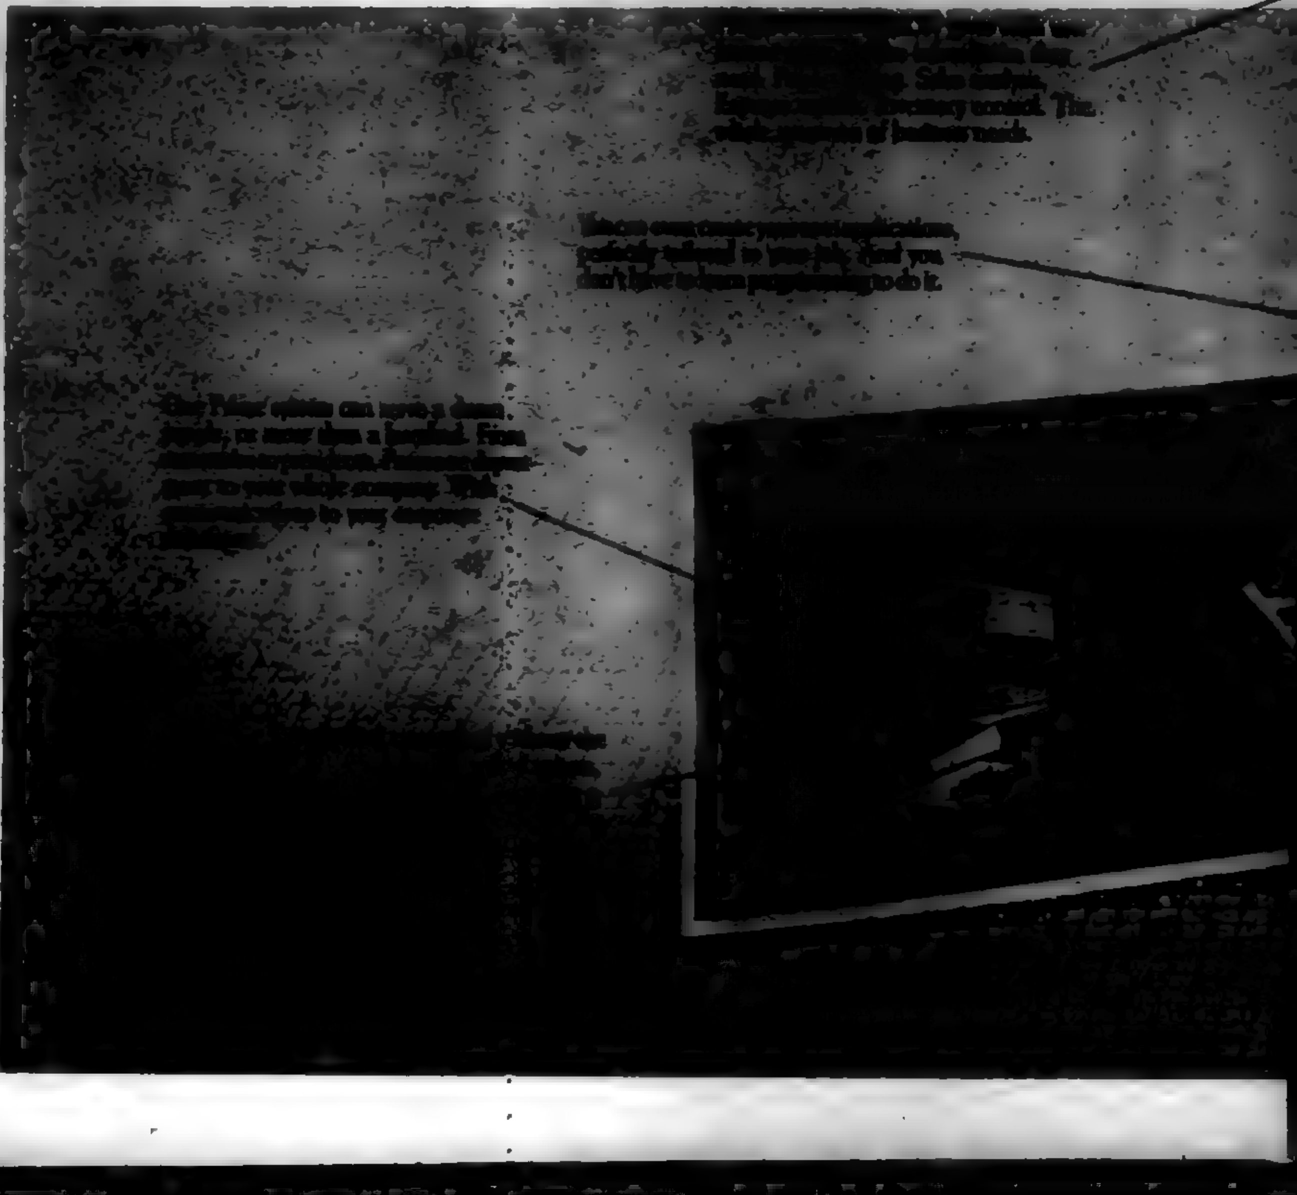
The directory offers brief summaries that describe each program, the programming language the software was written in and its hardware requirements. Each entry is indexed by number, subject, source agency, hardware and language.

Federal agencies, including the Department of Defense, the National Bureau of Standards and the Department of Energy, make their programs and documentation available to users through NTIS. Available packages include applications and graphics software, a variety of software tools and modeling and simulation programs.

The 1984 *Directory of Computer Software* is priced at $40 from NTIS, 5285 Port Royal Road, Springfield, Va. 22161.

Finally, personal software for big computers. Prime INFORMATION.

No, it's not a PC. It's one of many terminals connected to a single, powerful Prime® system. What makes it personal? The revolutionary Prime INFORMATION™ software.



[illegible] Sales analysis. [illegible] inventory control. The whole spectrum of business needs.
[illegible] perfectly tailored to your job. And you don't have to learn programming to do it.
[illegible]

Voice system tunes up automaker's communications

DEARBORN, Mich. — Simple telephone communications did not do the job for Ford Motor Co. when it needed to stay in touch with a mobile sales force.

Field managers often were on the road and wasted time playing "telephone tag," when the people they needed at a district office were away from their desks and the traveling sales managers themselves were hard to reach. Even returned calls sometimes missed connections when the original caller became unavailable.

The automaker decided to try a voice messaging system and, after studying the proposals of three vendors, launched pilot programs at two sales offices in February 1983.

The successful pilot programs led to a permanent and growing system in which the company has 2,000 voice mailboxes and hopes to establish 30,000 mailboxes worldwide in the coming years.

Ford officials said the system produced by VMX, Inc. of Richardson, Texas, is saving the company communications costs and lost man-hours while improving productivity.

"We've reduced the amount of telephone calls and telephone tag in the field by installing the voice mail system. I think that in the long term, this will be the best way to improve our productivity," said Jim Soma, director of telecommunications services for Ford.

Soma said that while the voice messaging system is now used only in Ford's facilities here, it will be expanded nationwide and then worldwide.

He said it can help to overcome worldwide time differences — differences that leave Ford only a four- to five-hour business day "window" to communicate with its personnel in England and "virtually no window" in Australia and Japan.

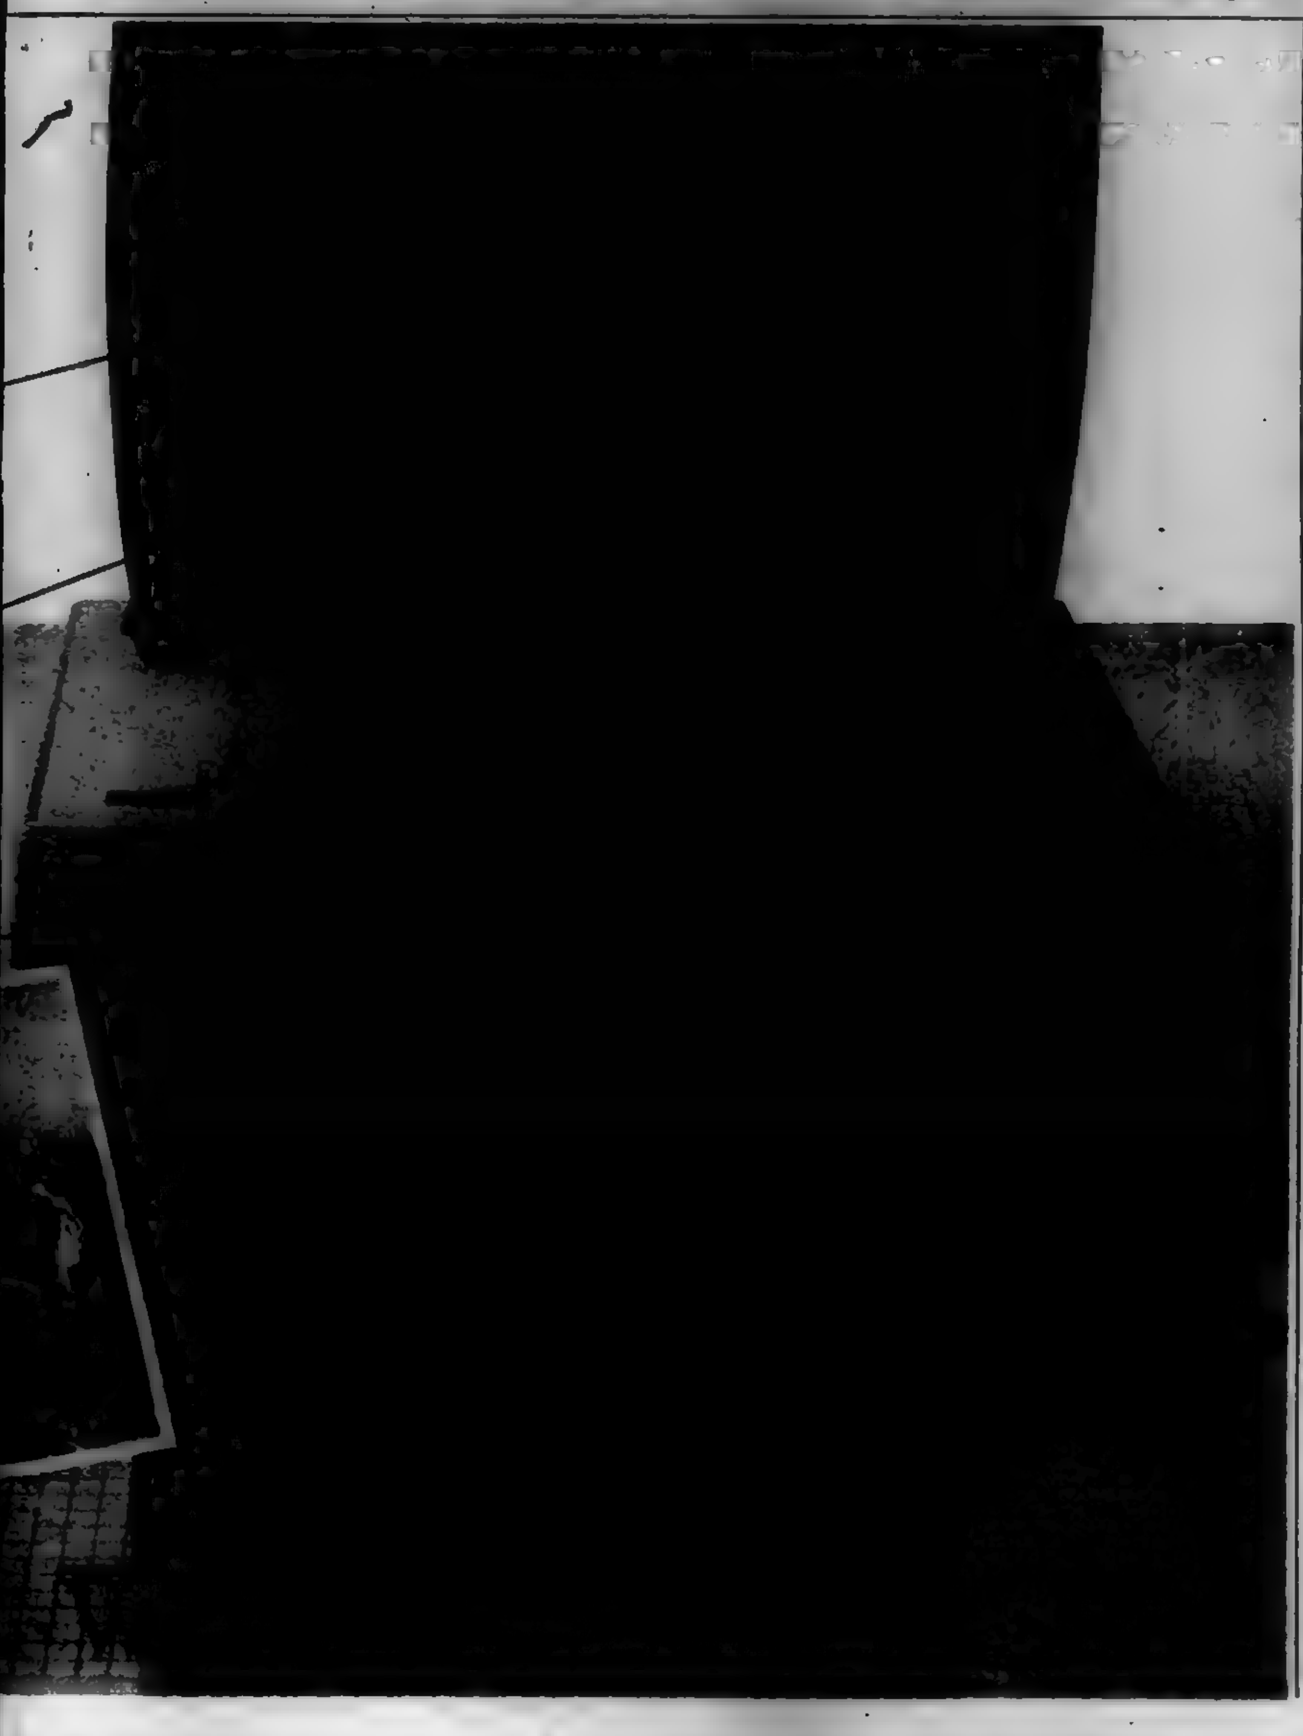
He said that the system will first be extended to the Los Angeles area in 1985.

The VMX system, Voice Message Exchange, uses a store-and-forward technology. Using an 800 number, an employee calls his office and, if the person he is calling is out, the employee leaves a message in an electronic mailbox. The caller also can check his own mailbox for messages and forward replies to others by pressing digits on the telephone set.

A Ford official said that advantages in the voice message system include eliminating interruptions of calls by incoming calls and the ability of the system to handle complicated messages with voice inflections and accents.

He said that equipment for the system was leased during the pilot phase, when 480 people had access to voice messaging, but that Ford began purchasing the equipment in January 1984. Four months later, the number of mailboxes had soared to 1,500.

One potential use for voice messaging, according to Ford, is in order processing, where dealers could call to order specific changes in cars scheduled for production. With the appropriate telephone lines frequently busy, the dealers could order changes at the touch of a telephone key.



DP conference to chart legal issues of micros

CHICAGO — Legal issues involving computers and the impact of the portable computer on corporate strategy are among the topics to be discussed at sessions scheduled for Info/Central: The Information Management Exposition and Conference, to be held Feb. 20-22 at the O'Hare Exposition Center here.

Info/Central will feature three days of conference sessions, with about 10 sessions each day. The show will concentrate on business applications of computers and communications systems.

The show's theme will be "Information Systems and the Executive Decision Maker."

Info/Software: The Information Management Exposition and Conference for Software will be held concurrently with Info/Central at the same location.

Cost of the exhibits for both Info/Central and Info/Software will be $5 for preregistrants and $20 on the day of the show. Info/Central and Info/Software sessions will cost $85 for a half day, $150 for one day and $295 for three days.

More information is available from Info/Central, 999 Summer St., Stamford, Conn. 06905.

OA outlays see significant rise

NEWPORT BEACH, Calif. — Expenditures for office automation are expected to increase significantly over the next two years, surveys from a national accounting firm indicate.

The two separate surveys, while not identical, were both conducted by the Newport Beach, Calif., and Chicago offices of Price Waterhouse & Co.

In California, respondents represented 43 companies in a variety of industries, including financial services, manufacturing, food service and state and local government. Surveys were distributed to 200 Orange, Riverside and San Bernardino County companies with revenues of more than $10 million.

According to the survey, "within two years, approximately 75% of all the companies [surveyed] intend to have implemented all the [OA] applications included in the survey." Those applications include word processing, spreadsheet analysis, text editing, graphics, microcomputer data base management, scientific engineering analysis, document transmission, project management, electronic filing, electronic mail and executive calendar and scheduling.

Workstations doubled

The survey also said the companies are planning to double their number of workstations in the next two years. It noted a 210% planned increase in the use of micros at these companies. Word processing functions are expected to grow 144%, the survey said.

More than 50% of the companies studied in California had revenues of more than $50 million; of those, 23.7% had assets greater than $500 million.

The Price Waterhouse survey of OA in the Chicago area found that 75% of those surveyed plan to expand their current OA department or open new branch offices within the next two years.

Twenty-six firms from a variety of industries, except law firms and government agencies, responded to the Chicago survey. Half of the companies with 1983 revenues of more than $50 million said they spend between $100,000 and $500,000 annually on their purchased and leased office systems equipment and software.

In the California study, the average investment in workstations per worker ranges from approximately $500 in large companies to $1,000 in small firms. The survey noted that the reason technology investments are higher for smaller companies could be because some smaller firms are buying more, less expensive micros.

The survey also found that there is approximately one workstation for every five white collar workers. In two years, the survey said, one workstation will accommodate two to three white collar workers. Investment in workstations will range from $5,900 per worker at large companies to $1,000 per worker at small companies.

Also in California, the survey found that word processing, text editing and spreadsheet analysis are the most extensively used applications in the office. Although about 98% of the respondents said they used automation for word processing, only 50% said it was "widely used" for these purposes.

OA effort spans work force at national insurance firm

By Edward Warner
CW Staff

WORCESTER, Mass. — An office automation plan that puts workstations on the desks of secretaries and middle managers is not news. But one that brings computing power to 900 out of a firm's 1,200 employees — from chief executives to mail room clerks — is a bit out of the ordinary.

Such an OA implementation is currently under way at the Paul Revere Life Insurance Co.'s national headquarters here. The insurance and annuity firm, a subsidiary of Avco Corp. with 150 branch offices nationwide, is undertaking a $3.5 million project to put either personal computers or terminals, all linked to the firm's mainframe-based OA software, on the desks of employees who can benefit from them.

The OA plan, set for completion by the end of 1985, relies entirely on IBM equipment. In all, 110 IBM 3178 terminals, 130 IBM 3290 terminals and 50 terminals for development work will join the 450 to 500 IBM 3178 and 3278 terminals already in use by the firm. Also involved are about 50 IBM 3270 Personal Computers, the computer of choice for, among others, the firm's vice-presidents who usually can avoid dealing with computers.

Top management was one of the first groups within the firm to be brought under the OA implementation, according to Executive Vice-President for Operations Charles E. Soule, who now has a 3270-PC on a table near his desk in his expansive office. Soule said he uses the computer to access mainframe OA software — IBM's Professional Office System (Profs) running on an IBM 3033 under VM — for calendar and electronic mail features, and he uses those functions "to plan a meeting without having to get on the phone."

Some aren't ready

Among the top managers, the OA implementation — similar equipment is now on the desks of the heads of marketing, finance, human resources and legal departments — is still only in the trial stage, and Soule observed that, while most managers find OA useful, "I think we'll find some instances where they're simply not ready for it."

One executive who isn't ready to have a computer or terminal on his desk is the firm's president, Soule said. But, "when the monthly financial report is available one day earlier on the terminal, he may want one," Soule added.

At the other end of the work force hierarchy, employees not often considered knowledge workers, such as those working in the firm's mail room, will also be studied as the implementation progresses to see if they can benefit from access to Profs or the corporate data base.

Computer terminals in the mail room actually make a good deal of sense, according to Lois F. Heiniluoma, director of data processing administration and one of those spearheading the implementation effort. "That person [in the mailroom] is working with a lot of packages; that person needs to know what was ordered and the day it shipped," she said, adding that such questions can be quickly answered by accessing the corporate data base.

Not every mail room employee will get a computer or a terminal, Heiniluoma said, but at least the supervisor and one or two key coworkers will have them — a situation, she said, that will be replicated in the firm's shipping and receiving department.

Conventional wisdom had held that a firm's uppermost and lowermost employee levels offer the great-

Users applaud PE superminis; software still an obstacle

By Charles Babcock
CW New York Bureau

> *'When we get into selling software, it's a liability to be on PE. We are still evaluating whether we want to be in that market. If we do, we would have to buy an IBM 4300 and make massive conversions of our programs.'*
>
> — Cynthia Jeness, Hazelhurst & Associates, Inc.

CHERRY HILL, N.J. — When Hazlehurst & Associates, Inc., an Atlanta employee benefits consulting firm, bought a computer system seven years ago, it didn't plan on selling software.

The firm bought Perkin-Elmer Corp. superminicomputers — two 3230s and a 3210 — for its Seattle branch. The move freed Hazlehurst from dependence on time-sharing and on an old Honeywell, Inc. mainframe that, according to the company, filled a room.

"At that time they [PE] were one of the few 32-bit producers [selling] at a reasonable price. PE did the best of the 15 vendors we tested," said Cynthia Jeness, consulting actuary and one of 300 PE customers at the Interchange '84 users group meeting held here recently.

Digital Equipment Corp. and Prime Computer, Inc. 32-bit machines were double the price of PE machines at the time, Jeness said. PE also had a good optimizing compiler for quick processing of Fortran code, she added.

Jeness and Lori B. Comer, Hazlehurst's Seattle systems analyst, said PE's relational data base management system, Reliance, was being updated regularly and functioned well for tracking and calculating employee benefits. PE's latest version of its OS/32 operating system, Revision 7.2, is "probably the best release they've put out," Jeness said.

So what's wrong with being a PE customer?

One of the new facets of Hazlehurst's business is selling employee benefit programs to clients who want to run them on their own equipment. Most of the clients are businesses, and most of their equipment is IBM.

"When we get into selling software, it's a liability to be on PE," Jeness said. "We are still evaluating whether we want to be in that market. If we do, we would have to buy an IBM 4300 and make massive conversions of our programs."

Robert L. Dalton, corporate manager of DP for the Frank Edwards Co., Burlingame, Calif., said he is happy with a new PE system that connects 45 terminals and 16 printers in an auto parts distribution network.

Dalton reviewed five superminicomputer systems before deciding on PE 18 months ago. "[PE] guaranteed a good response time and the system has lived up to it," he said.

Robert Wallace, a director of Cranfield Data Systems of Bedford, England, and Phoenix and president of the Interchange users group, said PE is noted among its customers for producing "exceptionally good, reliable hardware."

Wallace said the company's software has been the target of criticism, but "is getting better."

OA

from page 38

est resistance to adopting OA for themselves, but Heiniluoma said the implementation effort has not met with resistance from prospective users. "It's been more of a problem holding them back," she claimed.

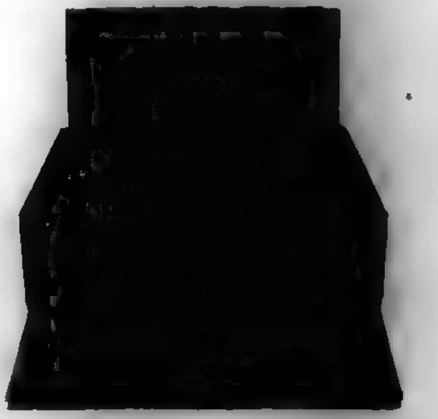
One current user of the Profs system, Director of Value Analysis William J. Domings Jr., said he has become very dependent on his system. When a change of offices temporarily took him away from it, he said he "went nuts."

Heiniluoma said the implementation will succeed, if the managers of each department it will affect are convinced that improving productivity by as much as 30% to 40% — with no corresponding drop in labor costs — will still have an impact on their departments' bottom line.

Otherwise, Heiniluoma said, the OA implementation is going smoothly, which she attributes to the fact that "we've done our homework." That homework consisted of a two-year, preimplementation study, the pilot project of which gave 75 people access to Profs. Those workers made a 13% productivity improvement, she said.

If the firm only achieves a 5% productivity boost from its new OA system, the system will pay for itself in three years, she said. If the firm gets only a 2.5% productivity gain, she continued, it will still receive a return on its investment equivalent to having put the $3.6 million in a bank account — at 28.7% annual interest.

OR HAVE IT ALL.



That's the choice your customers face.

Pick the new COMPAQ DESKPRO™ over the IBM® PC or *XT* and your customers get a lot more computer for their investment.

One that runs thousands of programs already available—at speeds two to three times faster. One with a dual-mode monitor (amber or green) to display text *and* graphics. One with exclusives like internal tape backup and shock-mounted storage system.

Pick the COMPAQ DESKPRO over the IBM AT and they get comparable performance for a better price…without asking customers to sacrifice their investment in PC/*XT*-compatible hardware, software and training.

And, of course, you can start having it all by selling COMPAQ DESKPRO today. So you start profiting today. No competing with "company stores" or company sales forces.

In short, COMPAQ DESKPRO is the only personal computer that can grow from a PC to *XT* to AT level of functionality—easily, affordably, compatibly.

Configure it the way customers want: With one or two diskette drives. One or two fixed disk drives. Or new options like a 30M-byte high-performance fixed disk, high-speed 8087-2 co-processor and internal tape backup for either the 10M-byte or 30M-byte fixed disk.

UNIX®-based operating systems? We run them today. PC DOS Version 3.0? That, too. Networking? Can do. Multi-users? No problem. *Multi-tasking?* Easy. Tape backup? It's inside. High-resolution text and graphics? Standard. Two speeds? Exclusive.

When you pick the COMPAQ DESKPRO, you *do* have it all.

It simply works better.

Ireland seeking high-tech relief for unemployment

By Paul Gillin
CW Staff

DUBLIN — After nearly 150 years of steady population decline, the Irish Republic is facing an unaccustomed situation — a population explosion. The increase has been so pronounced that today 50% of Ireland's population is under the age of 25.

For the Emerald Isle, this new development is a mixed blessing. While Ireland now stands poised for its first period of steady economic growth since it became a republic in 1922, the specter of unemployment looms larger than ever. For example, the International Organization for Economic Cooperation and Development (OECD) estimated recently that Ireland's unemployment rate will increase to 18% in 1985 from its current level of 14%.

In contrast, neighboring Britain's jobless rate will fall slightly to about 11.3%, the OECD stated.

Like many countries, Ireland has watched its manufacturing industry sputter over the last 10 years. Now, in an effort to bring more foreign money into the country, the government has undertaken a dramatic and wide-ranging project to attract high-technology investment. By most accounts, the effort has succeeded admirably.

The basis of the new incentive is a maximum 10% corporate tax rate for manufacturing profits in Ireland through the year 2000. The duty applies to all goods manufactured in the country, no matter where they are sold. The tax benefits also apply to software and DP services.

In addition, the government offers a 100% depreciation allowance with accelerated depreciation provisions that can effectively reduce the net tax rate for many companies to zero during their first few years of operation. The government has also created the Irish Development Authority (IDA) and endowed it with a large budget to aid foreign firms in setting up shop in Ireland. The IDA not only cuts through bureaucratic red tape, but also helps companies find prime manufacturing locations and administers a nationwide network of technical training centers.

In terms of attracting businesses, the Irish government's strategy has seen impressive results. More than 100 high-tech companies have established manufacturing and development facilities on the island. The government estimates the output of the Irish electronics industry will exceed $2.5 billion in 1985. More than half the foreign investment in Ireland is from the U.S.

The favorable tax rate has been the prime impetus. As a member of the European Economic Community, Ireland offers tariff-free access to nearly 300 million consumers. That, combined with the low taxes, has prompted several high-technology companies to base their European manufacturing and distribution centers on the island.

However, the investment has not translated into relief for Ireland's burdensome unemployment. High technology has added only about 20,000 new jobs, most of them among skilled workers. The IDA acknowledges that high tech will never provide significant opportunities for Ireland's unskilled and semiskilled work force.

Rather, the country hopes that electronics will create a stronger service sector to handle the infusion of foreign money onto the island. And in the near term, the government is concerned with retaining its stock of skilled workers before they seek employment elsewhere.

Education is Ireland's trump card. The youth of the country's population offers a motivated and energetic work force that is also increasingly well versed in the sciences. Major institutions like University College, Dublin, University College, Cork, Galway University and Trinity College have been beefing up their technical education offerings with government help. According to government figures, 61% of the institutions now offering degree and diploma or certificate programs were established in the last 15 years. Equally important, the government has taken steps to open up the traditionally rigid university system to a larger number of students.

The National Industrial Training Authority also administers a network of 17 training centers around the country. These heavily subsidized institutions offer introductory and continuing education to workers in technical fields and are another source of trained local talent.

Despite its success in attracting high-tech companies, Ireland is still worried about the flight of skilled young professionals from the country. Salary levels for computer professionals, for example, are about half to two-thirds as high as those of their American counterparts and lower than salaries in continental Europe. However, the government believes most of those professionals are

Unleash The True Potential
Of The 68000/Unix Environment

PHILON FAST/Compilers are so fast, your concept of speed will never be the same. Compilers that unleash the ultimate power of the 68000 and drive UNIX* to its fullest potential. PHILON FAST/Compilers redefine performance in benchmarks — UP TO 47 TIMES FASTER (see benchmark chart).

FLEXIBILITY — it's built in. PHILON FAST/Compilers are specifically designed to free programmers from artificial constraints (such as 64K program size or data file limitations) and allow efficient development of highly-optimized application systems. You can even link program modules in the same or different languages.

DEBUGGING — it's a snap. The Phi-Analyzer high-powered debugger vastly increases programming productivity.

THOROUGH TESTING — RESPONSIVE SUPPORT

You demand reliable compilers; Philon's quality assurance commitment delivers.

ACCURATE, EASY-TO-UNDERSTAND DOCUMENTATION — it's part of The Philon Approach.™ Plus, you can become part of a comprehensive customer support program designed to keep productivity at its maximum. This is what you will come to expect from Philon.

RECOMPILE EXISTING APPLICATIONS FOR DRAMATIC RESULTS

Dramatic speed improvements can be achieved by simply recompiling with one of these corresponding PHILON FAST/Compilers.

RELIEF

from page 40

willing to stay in the country if they can find meaningful employment.

The challenge for Ireland is to continue to draw high tech to its verdant shores at an even faster rate than it has in the past. The country seems to be well on its way to doing that. However, some observers believe the level of commitment from many companies is too tentative to promise any long-term relief. Because firms are required to invest so little to get their operations started in Ireland, they are less inclined to keep them running if times turn bad, they argue.

The Irish government believes exactly the opposite is true. Because it is so cheap to run a business here, it maintains, companies will be more inclined to fortify operations in Ireland and close down more expensive plants elsewhere. They point to the fact that Atari, Inc. continued to operate its Irish facility at full strength even as the company was laying off more than half of its Silicon Valley work force.

For now, the people of Ireland seem to be willing to give the government the leeway it wants to attract players in this fledgling industry.

For a tighter grip on manufacturing productivity... grab hold of RMS/38

Not many IBM/38 software packages offer tight-fisted MRP control. Perhaps you already found that out by using another system. If this is your first time, check out the features that are important to you. Our users enjoy the benefits of a closed-loop MRP II system that allows direct access for anyone to all the information stored. We have a query facility that lets you generate user reports. And we utilize an advanced data base architecture which increases programmer productivity, making changes needed for expansion simple and economical. We even have a PC link which lets you transfer information to your IBM Personal Computer for interaction with popular planning micro products such as 1-2-3™ from Lotus®

Loaded with RMS/38 the potent IBM System/38 can make your business hum with the precision these economic times demand. With anything else, you may have to settle for second best. In the fiercely competitive arena for manufacturing management efficiency, where survival depends on increased productivity—and profits—the software system you use can spell the difference between satisfaction or frustration, maybe even success or failure.

Only RMS/38 has 15 powerful applications to provide you with all the strength you'll ever need for total control. Control not only of manufacturing but all those vital support functions as well, including distribution and finance. Total software...RMS/38!

Reduce inventory; eliminate parts shortages; acquire time for skillful buying; schedule production based on demand, not parts availability; determine whether to buy or build needed components, improve part number, inventory, and routing accuracy; and order in time for delivery on time. You can with RMS/38.

If your present MRP system, whether manual or automated, represents something less than a total integration of business and manufacturing systems, if it doesn't offer the distribution and financial support of closed-loop MRP II; if it doesn't offer you control in an unpredictable environment: then maybe it's time you investigated the building block software of RMS/38.

For a free demonstration or more information, contact PCR, Professional Computer Resources, 2021 Midwest Road, Oak Brook, IL 60521 (near Chicago). Also in New York, San Francisco, and Los Angeles.

ALL THE SOFTWARE YOU'LL EVER NEED
312/932-2200

1-2-3™ is a trademark of the Lotus Development Corporation.

2000 OF THE FORTUNE 500.

In the past few years the biggest, the brightest, the toughest companies in America tried something new called a ROLM® digital phone system.

Then they ordered another. Then another.

And, suddenly, there were more than 2,000 ROLM systems up and running in more than two-thirds of the *Fortune 500* companies.

Today, nine of the ten largest banking companies rely on ROLM. Eight of the ten largest insurance companies. Nine of the ten largest brokerage houses. The top computer makers, EDP makers, airlines, retailers, hotel chains. The list goes on and on. And on.

Why ROLM?

Because ROLM systems are simply the most flexible, the most advanced, the most inevitable

business communications systems in the world today.

We'll show you how to manage voice and data together. On one system. (It's easy. We're the people who taught computers and telephones and people how to work together.)

You can grow from sixteen phones to ten thousand phones and terminals and computers. On one system. Today. Next year. Into the next century.

ROLM has the technical edge, the operational track record, the worldwide service organization to please the toughest customer.

You're not a *Fortune 500* company? Relax. Inside every great, little company is a great, big company scrambling to get out. All it takes is a lot of hard work and a little luck.

And, if history's worth anything, a ROLM business communications system couldn't hurt.

ROLM

4900 Old Ironsides Drive, M/S 626, Santa Clara, CA 95050 · 800-538-8154. (In Alaska, California and Hawaii, call 408-986-3025.)

Software helps airline reach new highs in efficiency

Application tools allow tie-in to worldwide passenger, cargo reservation system

HONG KONG — One of Southeast Asia's largest airlines has officially inaugurated two software application systems to increase efficiency in its operations and improve customer service.

Founded in 1946, Cathay Pacific Airways, Ltd. serves Hong Kong, Japan and China, Australia, India, Europe and Canada. Cathay's data processing operations rely on Sperry Corp.'s 1100/83 and 1100/62 multiprocessor systems running Sperry's Univac Standard Airline System.

The two recent software acquisitions — one to expedite passenger reservations, the other to expedite cargo shipments — are Sperry's Advanced Seat Reservation (ASR) facility and Cubic — Sperry's computerized cargo system.

The two packages are used in tandem with Sperry's Cupid worldwide reservation system. According to Donald Birch, manager of data processing operations, the ASR passenger system handles bookings and flight confirmations, primarily for first-class and business-class passengers and passengers with special needs, such as those with babies requiring in-flight cradles. The ASR network has been added to the airline's worldwide reservation system, which links 450 VDTs in 27 cities.

Computerized seat plan

Passengers benefit from the upgraded ASR facility because it will allow them to pick the seats they want up to six months in advance from a computerized aircraft seat plan displayed on the travel agent's terminal, according to a Cathay spokesman.

Seats can be confirmed instantly, and any possibility of overbooking is eliminated because the seat map is automatically updated, Birch claimed. The seat map provides information including seat location, smoking areas, viewing angles and special requirements such as those for handicapped people, he added.

The Cubic computerized cargo system has facilities for such aspects of cargo operations as freight reservations, space control, shipment data capture, air waybill printing, goods acceptance, warehouse operation, manifesting, check-in at the import station and delivery to the consignee.

Robert Atkinson, Cathay Pacific's cargo manager, said the major benefits of the Cubic system will be in the area of customer services such as on-line reservations for packages, customs clearance and consignee notification.

Cubic will be implemented in two stages, Atkinson explained. The first phase will consist primarily of reservations and space control functions. Any of Cathay Pacific's offices equipped with the system will be able to access the available cargo space on-line and obtain instant confirmation of bookings. Functions to be implemented in the second phase, in January, will cover everything related to cargo handling and routing.

Cathay Pacific is presently using the Cubic cargo network in Tokyo and Osaka, Japan; Taipei and Kaohsiung, Taiwan; as well as London and Frankfurt.

How to be in 16 places

Netherlands slow to catch high-technology fever

Low-key Dutch climate, export of R&D efforts hindering acceptance of new technologies

By Hans Braggaar
Special to CW

ROTTERDAM, Netherlands — Europe is condemning itself to a role as the world's recreation spot instead of a high-technology market contender, according to experts here.

"The dynamics of the Netherlands' infrastructure for small- and medium-size enterprises are not [synchronous] with the dynamics of the electronics industry — [which] is in a period of strong growth," argued Ray Jursovich of the Department of Interdisciplinary Studies here at Erasmus University.

In a study titled "An Overview of the Major Issues Facing Small- and Medium-Size Enterprises in the Dutch Electronics Industry," Jursovich concluded: "The problem lies in institutionalizing a way of thinking and doing in working with information and building information networks which promote the creation of new market niches."

Jursovich maintained that while there is no shortage of aggressive Dutch entrepreneurs to develop high-quality products, most of the fruits of their research and development efforts are exported.

At the same time, certain aspects of the Dutch cultural climate — the lack of competitiveness in government, a history of low-risk behavior in financial institutions and an expensive welfare system that discourages self-initiative — make it difficult to set new ideas in motion.

Museum and discotheque

Jursovich's conclusion was echoed recently in a speech given by Philips Information Systems, Inc.'s Vice-President Gerrit Jeelof, who cited the Japanese scenario of a worldwide electronics market. "The Japanese scenario for long-term development around the world described the U.S. as a granary. The Far East, including Japan, will be the world vendor for all kinds of hardware. And Europe? . . . [Europe will be] a combination of a cultural historic museum and a discotheque."

But the picture is not totally bleak, Jursovich pointed out. In Holland, there are sociological indicators that the situation is changing:

- Unions have expressed a willingness to cooperate with the implementation of new technologies.
- A growing national interest in electrical engineering and computer science exists.
- Financial facilities have been improved for small and innovative firms.
- Big companies, including [Philips Information Systems], have made efforts to promote spin-offs and actively seek cooperation with small- and medium-size firms.

In spite of all this, the high-tech fever has simply not reached the heights that Jursovich feels necessary for a healthy high-technology future in Europe. He lamented, "The dynamics that you feel when you get off an airplane at Kennedy or San Francisco International Airport are just not here."

...at once.

With Northern Telecom's unique multi-tasking capability, you can perform a multitude of jobs—simultaneously.

Now your staff can work on spreadsheets, move to word processing, shift to personal computing, then access data and communicate, without missing a beat. No more time-consuming interruptions. Thanks to the unique multi-tasking capability of Northern Telecom's 500 Series Office Information Systems.

With our unique access feature, your staff can leave any application at any point and move to another—and another—while the original task is processed through completion. In fact, the 500 Series will keep track of as many as 16 running programs at once!

Northern Telecom's 500 Series Information Systems also have outstanding communications capabilities. Besides being compatible with each other, they communicate with a multitude of mainframes, including IBM, Burroughs and CDC. They also talk to other minis and even micros such as IBM PC's and Apple.

Our multi-tasking capability allows for up to 16 users to access common files—send or retrieve—from across the hall or across the country. So your people spend less time researching, duplicating efforts and conducting meetings.

Let us show you how easy and cost-effective it is to be in 16 places at once.

Write Northern Telecom Inc., 9705 Data Park, P.O. Box 1222—T-240, Minnetonka, MN 55440; or call 1-8[redacted].

Major U.S. firms announce participation in Esprit

By Hans Braggaar
Special to CW

BRUSSELS — Three of America's technology giants — IBM, ITT and Digital Equipment Corp. — will formally participate in the European Strategic Program for Research and Development in Information Technology (Esprit).

Although originally confined to European companies, recent joint Esprit proposals have included one from DEC's German subsidiary to work with the French conglomerate, Renault Automation, along with Comau, a subsidary of Fiat in Italy, to pursue collectively a project on computer-integrated manufacturing. The plan has already been approved by Esprit officials, but a few details, such as funding, still remain to be worked out, sources said.

ITT actually became the first U.S. company to join the Esprit program. During Esprit's pilot phase last year, ITT's German and Belgian subsidiaries, Standard Elektrik Lorentz and Bell Telephone Manufacturing Co. (BTMC), were active participants. BTMC combined its efforts with those of a French company and the University of Louvain near here and produced a compiler for an advanced signal processor.

It is not yet clear what role IBM ultimately will play. It is generally held that Big Blue will join the European companies as a subcontractor in B-type projects. B-type projects are those innovations that are idea-driven, as opposed to A-type projects, which reportedly will account for 75% of all Esprit funding and will be system-driven.

Europe-wide network

Research on Open Systems for Europe (Rose) is a telecommunications project within the Esprit program. The participants within the Rose project will develop a Europe-wide network to connect research institutes, government bodies and the policy-making bodies of the European Economic Community (EEC) member states. Rose communications software will reportedly be developed using the AT&T Unix operating system and the Organizational Standards Institute (OSI) model standard for open systems interconnection created by OSI and the Consultative Committee on International Telephone and Telegraph.

An Esprit Information Exchange System (IES) is the goal of Rose. The initial facilities made available in July 1984 consisted of the Eurokom computer-based conference; a mail and message system, which was installed at the computer center of the University College of Dublin; and a Unix-based facility giving the European Unix Users Group access to electronic mail, file transfer and other facilities.

In addition to the Esprit IES, a number of other research networks and information exchange systems are planned or are already in operation with the Esprit network. These currently include the DFN network in West Germany; Janet in the U.K.; Osiride in Italy; Centernet in Denmark; Eunet for the European Unix Users Group; and finally Hepnet, a network for High Energy Physicists.

Another Esprit project is Research and Development of Advanced Communications for Europe, which reportedly is intended to harmonize the European telecommunications market. European ministers in charge of industrial policy have been pushing for European communitywide standards for telecommunications systems and open procurement policies for some time.

Because telecommunications standards are badly needed, the ministers have agreed to homogenize all new communications services to be offered as of January.

INTERNATIONAL REPORT
CW International
News Network

AUSTRALIA

MELBOURNE — The Victoria Police Department has been given the OK for the first phase of its $10 million computer system. The $4.25 million initial stage calls for an IBM 4381 with 8M bytes of memory and Software AG of North America, Inc.'s Adabas data base software. The system, which will replace the police force's Sperry Corp. V77 minicomputers, will support some 165 terminals.

JAPAN

TOKYO — Some 92% of 1,791 Data Show attendees claimed to use microcomputers. Such were the findings of a *Computerworld Japan* survey conducted during the recent trade show here. The respondents used products from the following vendors, in descending order of preference: 45%, NEC Corp.; 15%, Fujitsu Ltd.; 9%, IBM (up one percentage point from last year); 4%, Sharp Corp.; 3%, Hitachi Ltd.; and 3%, Toshiba Corp.

The companies that each held roughly a 2% share of the Japanese micro market included Sord Computer Corp., Mitsubishi Electric Corp., Apple Computer, Inc., Oki Electric Industry Co., and all others claimed the remainder, the survey said.

Findings also revealed that approximately 50% of users surveyed were not satisfied with hardware, software or services. Specific complaints included the lack of capabilities and quality of available commercial software.

■

TOKYO — According to a report from the Ministry of Home Affairs, the local government of Japan had an installed base of 2,273 computers as of April 1, 1984, a 16.5% jump from last year. The computerization of local government offices has been gaining in popularity here, and to cope with Japan's emerging "communications society," the country has been adopting on-line systems with Kanji-character systems.

Comdex not popular in Europe

By Luc Sala
Special to CWS

The recent Comdex Europe, held in Amsterdam from October 29 to November 1, showed healthy attendance figures with 7,300 visitors, but it still does not begin to approach the dimension of the 50,000 people who attend Comdex shows in the U.S.

Nor did this past show provide much news or many new attractions — unless you wanted to set up shop in Europe. Potential employers could have had their pick of lucrative spots at this year's show, where many trade boards from European countries were represented in hopes of attracting business investments to their regions.

AT&T's Unix was the focal point for most of the exhibitors on hand, with AT&T and Olivetti Corp. promoting it via their newly formed Unix Europe organization.

The other big draw at the show was the International Computers, Ltd. booth, which for the first time displayed the vendor's Clan multiuser Unix-based supermicrocomputer (2900 series). This Motorola, Inc. M68010-based system works with four to 16 workstations, each having access to all systems functions.

But the third annual Comdex Europe just did not rise to be the international OEM or dealer show that the Interface Group, Inc. wants it to be. Although more than 50% of the attendees were not Dutch, the total number of visitors was still a bit disappointing.

The Interface Group, however, does appear to have the stamina to go on and eventually turn Comdex Europe into a major event. All the right ingredients are there.

Sala is the editor of a Netherlands-based microcomputer newsletter and a frequent contributor to Computerworld.

And we can prove it.

We put our 212 modem to the critical test. We stacked it up against Hayes, one of the "smart" modems.

The Performance

Hundreds of phone calls were carefully monitored, analyzed, and verified by telecommunications engineers. After exhaustive testing, the results were conclusive: when line quality was average, our modem was one and a half times more accurate than Hayes. When line quality was bad, however, our modem was up to ten times more accurate. And when line quality was really bad, their error rate shot up to as much as 100 times ours! The errors ranged from misspelled words to incorrect numbers. The implications for modem business are understandably serious.

The Reliability

Then we went inside and did a component count. The final score: Hayes 252, us 155. This can be viewed two ways: Either Hayes has a 60% better chance of developing part failure, or our modem has a 60% better chance of delivering higher reliability.

Eliminating operator risk is as important to us as eliminating errors. With our modem there's virtually no risk of electrical damage because there are no internal switches to deal with. General DataComm modems automatically select all call parameters.

The Company

The General DataComm intelligent modem is the newest product of a company that has been designing data communication systems for 15 years. A company whose customer list is a "Who's Who" of international business. Most of the Bell operating companies, and other telephone companies in the U.S. and Canada. Major banks. Brokerage firms. And many of the Fortune "500."

We build multiplexers, modems, local area and digital network products, and the most complete networking systems on the market. Now we're applying the technology that won the respect of big business and Bell to the personal computer market. With a line of 300 and 1200 bps modems and our own communications software.

The General DataComm modem. We put it to the critical test. Now it's ready for the ultimate test. Yours. To find the dealer nearest you, contact the Personal Computer Products Dept., (203) 574-1118. General DataComm Industries, Inc., Middlebury, CT 06762-1299.

General DataComm

The best connections in the business.

Tool condenses time for checking program changes

By Paul Gillin
CW Staff

PLEASANTVILLE, N.Y. — The syndrome is common: The program you recently brought in for maintenance is now showing an annoying bug, and you cannot seem to find where the error occurred. It could be the result of something as small as a dropped punctuation mark or an accidentally deleted line. The only solution is to examine the source code line by line.

Two DP shops that have experienced such problems in the past have taken steps to overcome them by installing a source code comparison utility for use in program maintenance. Although they report that the product is not for use by everyone, both said the $1,000 purchase price was well worthwhile.

Reader's Digest Association, Inc. here installed Maintenance Aid (Maid) from Data Aid, Inc. of North Granby, Conn., late last year. The product has helped to cut the time required to check programming changes by at least half, according to Elizabeth Adams, financial analyst.

Adams is part of a group of three analysts and 12 programmers who write and distribute program changes to Reader's Digest locations around the world. The department writes mostly in Cobol under IBM's MVS operating system.

Cut-and-paste process

Previously, the process of making maintenance changes had been a cut-and-paste operation in which changes were difficult to track, especially on the larger programs, Adams said. With Maid, the time required to track down errors has been substantially reduced, she said.

Maid basically compares two versions of a program and lists the changes that have been made. It produces reports showing the five lines of common code preceding and succeeding the changes, with any additions or deletions listed in the middle. The reports can be used to ensure that the required modifications have been made as well as to track down inadvertent changes, Adams said. "In one case, a programmer had accidentally deleted a paragraph of code, and we were able to pull it back up without rewriting it," she said.

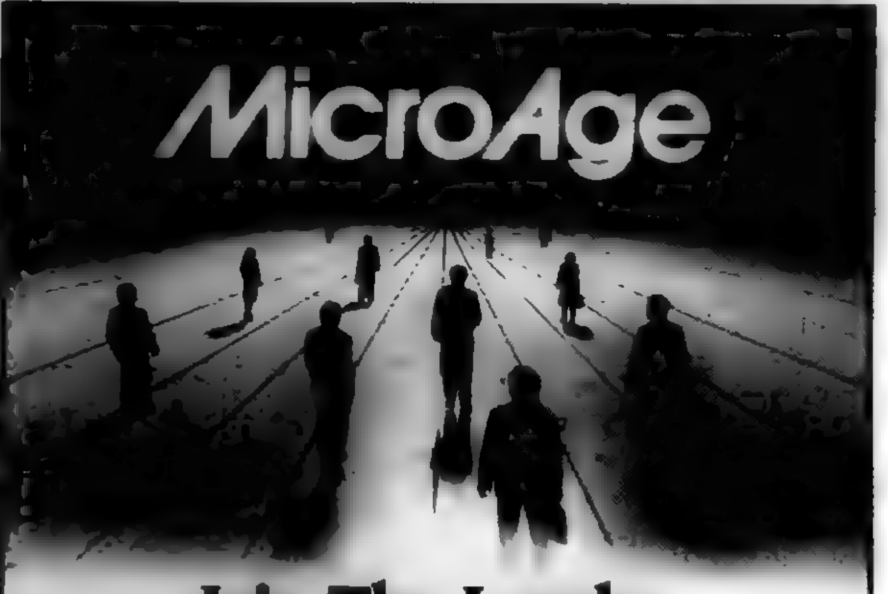
Documenting changes takes only about one-tenth as long as it did before Maid was installed, she said. The tool has cut supervision time by about one-third, she estimated.

Steve Merritt, a section manager for financial applications at Mead Corp. in Dayton, Ohio, was less enthusiastic about the product, but said that it was still worth the purchase price. Because Mead programmers are required to document changes heavily, Merritt said Mead uses the product only about once a month.

Mead uses Applied Data Research, Inc.'s ADR/Librarian for its source code library. Maintenance is done in partitioned data sets (PDS) under IBM's TSO. Only current versions of programs are maintained in the library, with previous versions archived on tape.

"We don't use the compare feature on Librarian, and occasionally we want to compare different versions of a piece of software," he said. To do that, the user creates two PDSs and loads the current and archived versions of the program. A Maid comparison can then be run to generate a list of lines that have been changed or deleted. "It's mostly used when we don't have the source code or when the programmers can't remember what changes they've made," Merritt said.

If Mead begins using the archival functions of ADR/Librarian, it would negate the need for Maid, Merritt said. Until then, he thinks Maid is a handy utility to have available. "I wouldn't be surprised if it comes along one day and really proves itself," he said.



Join The Leader

. . . and be a Leader!

MicroAge is the computer solution leader. Throughout the United States and Canada, businesspeople rely on MicroAge for advice, leading products, and service when computerizing their companies.

But remaining the leader takes talented professionals who are willing to invest in their own community. People who are willing to assume a leadership position. That's why MicroAge is meeting with individuals who want to own and operate a MicroAge store.

Owning a MicroAge franchise is more than running a store. We sell multi-user systems, local area networks and telephone systems . . . along with personal computers. We provide service, installation and training for our customers.

If you would like to develop a long-term relationship serving the businesses in your area, let's talk business.

Building your own professional computer sales organization with MicroAge requires an initial investment of $200,000 to $300,000, which includes $80,000 in liquid assets. Call or write:

IBM PC Workstation-$1595.00

Santa Clara Systems makes your investment in the IBM PC, PC XT or PC AT look even better.
Now, everyone in the office can afford to have an IBM PC at their fingertips. Without buying additional computers, and for a fraction of their cost. Only $1595.

The Santa Clara Systems PCterminal, complete with keyboard and monitor, easily connects to any existing PC, PC XT or PC AT allowing you to share the data and resources you already have on hand —hard disk drives, printers, graphic plotters and the like.

Built-in local area networking makes it possible.

PCterminal won't limit your existing PC's performance either. Because it has its own 8088 microprocessor and 64 KB of random access memory, expandable to 256K.

Very intelligent indeed.

But that's not all. Built-in parallel and serial ports, along with four expansion slots enable you to add a host of peripherals, as well as additional memory, graphics cards and other productivity enhancers.

The Santa Clara Systems $1595 PCterminal. A small price to pay for a big gain in productivity.
You won't find a better value anywhere. Your local Santa Clara Systems distributor can prove it. Call and order yours today.

PBX market growth found a boon for large vendors

AT&T, Northern Telecom, Rolm expand market share; smaller firms pull out

NEW YORK — Growth in the private branch exchange (PBX) market helped large vendors such as AT&T, Northern Telecom, Inc. and Rolm Corp. in 1983, while at the same time causing other suppliers to lose market share or quit the business, according to a recent market research study.

The most significant development in the U.S. PBX market, the study by Northern Business Information, Inc. concluded, has been AT&T's ability to regain market share after more than a decade of losing ground.

The study estimated that AT&T, Northern Telecom and Rolm all made slight gains in their share of the market last year, with AT&T leading the pack with a 24% share. Northern Telecom was estimated to have a 16% share, followed by Rolm with 14%.

Shipments of PBXs increased 17% in 1983, compared with a 6% growth in 1982, the study found. That double-digit growth is not expected to continue, the study stated, noting that in 1983 many Centrex users bought PBXs because of worries about access charges and hefty rate increases.

Although 1983 growth rates are not expected to continue, "the PBX market will remain healthy," the study predicted.

AT&T's introduction of the System 85, the company's first digital switch, helped drive demand for all digital products in 1983, the report said.

The System 85, the report stated, "legitimized Rolm and Northern Telecom's approach to the market. AT&T's emphasis on digital PBX-based office automation systems is shortening the average life cycle of PBX systems; analog electronic switches are starting to be replaced with digital ones."

Established PBX suppliers, the study stated, are "fighting hard" to maintain their positions and to take advantage of a lack of networking products offered by IBM. Meanwhile, other major computer manufacturers are working with PBX vendors to develop interface devices to connect their systems with PBXs.

The volatile PBX market has attracted some new vendors, while causing others to quit the market. Recent casualties in the PBX market have included Datapoint Corp., Rockwell International Corp. and Telesciences, Inc.

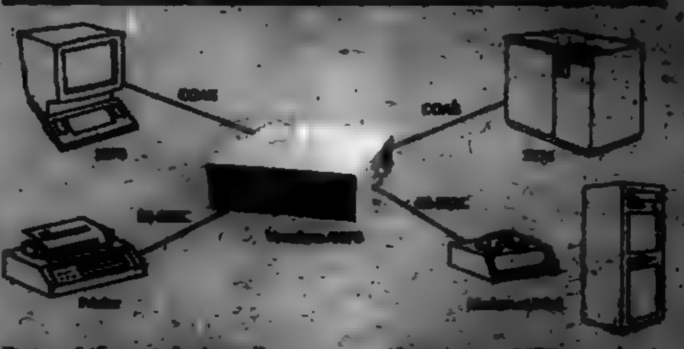
The report, priced at $1,975, is available from Northern Business Information, Seventh Floor, 157 Chambers St., New York, N.Y. 10007.

IBM 3278 to ASYNC

Versalynx™/3278 from Local Data.
Connects your IBM 3278 CRT to nearly all the world.

The Versalynx™/3278 protocol converter provides IBM 3278 CRTs with an ASYNC ASCII RS-232C interface. Your IBM 3179, 3279, 3178 and 3180 can be used as well with the Versalynx™/3278. Your 3278 CRT can emulate VT-100/102, HP 2621, ADM 3A and IBM 3101 in conversational mode. The Versalynx™/3278 works for local and remote IBM 3270 systems with async data rates to 19.2 Kbps.

Equipped with an auxiliary RS-232C printer port, menu [illegible] keyboard control of [illegible] ASYNC mode, the [illegible]



State-of-the-art design allows scrolling of the IBM CRT at high data rates.

And, the IBM 3278 terminal can dial-up IBM mainframes using low cost asynchronous modems at 1200 or 2400 baud and a matching Local Data protocol converter at the host-end.

Versalynx™/3278 standard model $695 single quantity domestic price.

Seminar to stress microcomputer communications

WASHINGTON, D.C. — The first in a series of four seminars on personal computer communications, each led by J. Scott Haughdahl, will be offered here Dec. 3-4.

The seminars will focus on personal-computer-to-mainframe communications — particularly via gateways and communications servers — and on personal computer local networks, according to the sponsor, Architecture Technology Corp. Haughdahl is said to have considerable experience in simulation of multiprocessor mainframe environments and the design and implementation of specialized server software for personal computer local networks.

Other seminars will be held in Orlando, Fla., on Dec. 5-6; in Los Angeles on Dec. 10-11; and in Honolulu on Dec. 13-14.

Seminar registration is $645. Additional details are available from Architecture Technology, P.O. Box 24344, Minneapolis, Minn. 55424.

Meet to target audit, DP staff

BOSTON — MIS Training Institute, Inc. will hold a conference titled "Control, Audit & Security of Digital Equipment Corp. Systems," Dec. 3-5 at the Westin Hotel here.

DEC President Kenneth Olsen will give the keynote speech, touching on the impact of current and future software and hardware systems on management information and the role of the auditor and DP professional.

The conference will include sessions on VAX-11/VMS control and security, RSX-11M/RSX-11M-Plus control and auditing, networking and local-area nets, AT&T's Unix, VAX-11 audit packages, encryption and microcomputers.

The conference fee is $650. More information can be obtained from Beth Evans, MIS Training Institute, 4 Brewster Road, Framingham, Mass. 01701.

Introducing VU-TEK.

No other glare screen does more to increase productivity.

A glaring problem VDT operators face.

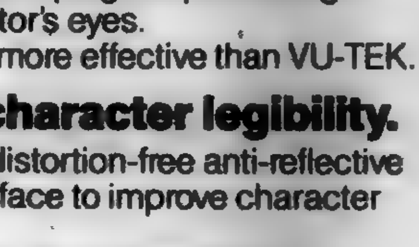
More than 90% of all employees who regularly use VDT's may suffer from eyestrain.* And that can make your business suffer, too.

The cause of eyestrain? Glare. Reflection from office lights. And hard to read characters.

The result. Impaired vision. Headaches. Fatigue. More work breaks and absenteeism.

And reduced office productivity.

VU-TEK™ reduces glare up to 99%.



VU-TEK contrast enhancement filters help increase operator productivity by eliminating up to 99% of reflected VDT glare while also improving character clarity. VDT operators can now work more efficiently and comfortably.

VU-TEK's dramatic effectiveness is due to an advanced circular polarizer that traps glare preventing it from reaching the VDT operator's eyes.

No other glare screen is more effective than VU-TEK.

VU-TEK increases character legibility.

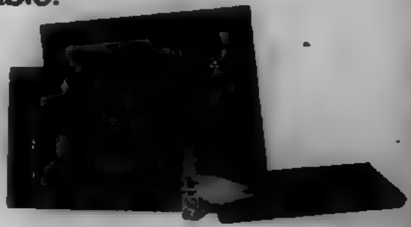
VU-TEK uses a special distortion-free anti-reflective coating on the front glass surface to improve character contrast and clarity.

The result... bright, clear, easy to read VDT's.

American Hoechst Corporation
Specialty Film Products

Fits leading VDT's. Easy to install.

VU-TEK fits more than 800 different VDT types. Custom sizes are also available.



VU-TEK is lightweight, durable and attaches in seconds.

"See for yourself" free trial.

End the glaring problem with computer automation — with VU-TEK.

To order your VU-TEK or arrange a 30 day free trial, call collect 1-805-987-5026. Or mail the attached coupon for more information.

VU-TEK is the result of research by American Hoechst, a member of the Hoechst Group of companies, with worldwide sales of $14.5 billion, and annual research expenditures of over $630 million.

*National Institute For Occupational Safety and Health Study, August 1981.

Lawyers advocate LSInet to ease work in complex cases

By Donna Raimondi
CW Staff

BOSTON — A computerized legal network designed to make research materials and legal counsel in large, complex civil cases more accessible is under development here by a group of lawyers.

The system, called LSInet, will permit member law firms to store information on a central data base, electronically share files, refer work to each other and retrieve information using software designed by Programming Management, Inc. of Milton, Mass., said Charles J. Purelli, president and chief executive officer of Litigation Systems, Inc.

Scheduled to begin operations by the end of this year, LSInet will provide networking and storage of case files, instead of just access to case law, Purelli said. Fifteen major defense law firms across the country are currently members of LSInet, and Litigation Systems is actively recruiting insurance companies and self-insured corporations to join, he said. "With our network, an insurance company could keep track of all litigation being handled by its law firms across the country."

LSInet was the brainchild of William E. Bailey Esq., former senior vice-president and claims counsel at Commercial Union Insurance Co. and an authority on asbestos-disease litigation. Property-casualty insurers paid more than $4 billion in fees to outside legal counsel in 1983, Bailey said. Over the last several years, these costs have been going up by about 20% to 30% per year, he said.

Much of the expense is not for attorneys' hourly fees, but rather for developing and maintaining huge paper files, Bailey said. Realizing that automation had not been used to its fullest potential to control these ancillary expenses, Bailey set out to develop a network of computer, legal and insurance expertise to address the problem, he said.

[redacted] or compatible models or IBM-type terminals to connect via telephone lines to a data base that resides on an IBM 3033 mainframe, backed up by an IBM 3081, Purelli said. A password system protects confidential files, while public information such as court records and government documents can be shared, he said. The menu-driven programs were designed by lawyers to prompt in the same sequence a lawyer or paralegal normally uses, he said. Purelli said a paralegal researcher might overlook discrepancies in the testimony of an expert witness who has testified several times in different states. The computer system will not overlook such discrepancies, and the variations can be brought up at the witness's next appearance.

More information is available from Litigation Systems, 77 N. Washington St., Boston, Mass. 02114.

WHAT WE
BELIEVE:

Mini saves hospital time on tracking drug schedules

System helps pharmacy label intravenous solutions, monitor their dosage

FORT LAUDERDALE, Fla. — Holy Cross Hospital here needed a better way to track medication schedules and label more efficiently the 500 to 800 intravenous (IV) solutions administered daily to patients.

Approximately four years ago, the 600-bed hospital acquired a Four-Phase Systems, Inc. IV-70 minicomputer, and recently, the hospital upgraded to a Model IV-90. "We needed more memory," said Edward Propst, director of pharmacy at Holy Cross.

The pharmacy application, written in Cobol and part of the Four-Phase system's Multifunction Executive (MFE) software, schedules patient's medications and IV labels. A line printer is used to produce unit dose medication envelopes, medication records, management reports, financial reports and clinical drug monitoring. A character printer is dedicated to printing the IV labels, which, Propst said, saves valuable time. "To type all those IV labels each day would be an enormous job," he said. The pharmacy secretary uses the Four-Phase system for printing management reports, newsletters, labels and memos.

Files are structured in a way to make it possible to print the hospital drug list by American Hospital Formulary Service categories as well as alphabetically by generic name with cross-references to trade names.

Propst said the system is extremely reliable. "The system provides the pharmacy with the flexibility to schedule preventive maintenance, system and program upgrades and tests during slack hours. The system also supports unit dose and intravenous admixture distribution," he said.

Because the department work load slows down at night, the pharmacist on duty runs programs to print patient drug records, charges, discharge summaries, clinical drug monitoring and cost and revenue reports.

As a security feature, the MFE software requires a valid sign-on code for access to the system. This allows the application program to identify the pharmacist who reviews, approves and enters the physician's medication orders into the patient's medication record. By use of a priority indicator in the sign-on code, the pharmacy management program gives only authorized personnel access to certain functions.

For the future, Propst said, the hospital plans to write software that will make the system even more reliable.

Small-computer meet scheduled

ARLINGTON, Va. — A three-day conference on small computers in [redacted] ton National Hotel here Dec. 10-12, 1984.

The Third National Conference on Small Computers in Government, sponsored by the Public Management Institute of George Mason University, is geared toward DP and office automation technical professionals, managers of small-computer users, small-computer professional end users and administrative management personnel.

Topics of the seminars and workshops revolve around management issues and concerns. A vendor showcase on small-computer products and [redacted]

Registration fee for the conference only on Dec. 10-11 is $455 for government registrants and $510 for industry participants. Workshop-only fee on Dec. 12 is $285 for government registrants and $310 for those in industry. Conference and workshop fees for all three days are $625 for government members and $700 for industry members. More information is available from USPDI, 1620 Elton Road, Silver Spring, Md. 20903.

IBM directory lists software

BOCA RATON, Fla. — IBM has published a catalog of software programs for its Personal Computer that includes entertainment, education, personal productivity and business applications.

The Directory of Personally Developed Software includes programs developed by IBM employees and individuals outside IBM. The first issue contains 36 new programs for the Personal Computer, ranging in cost from $14.95 to $149.95.

The directory is scheduled to be published three times a year. The first issue is being distributed free. Subsequent issues will cost $4 a copy; an annual subscription is $10. The catalog can be obtained at authorized IBM Personal Computer dealers.

Board protects accessible micro

Ensures use by acccounting personnel only

SCOTTSDALE, Ariz. — When the accounting department for a digitizer manufacturing plant here first considered buying a personal computer, its manager thought the machine would reside in a secured area.

But when the department bought its IBM Personal Computer XT, the machine ended up in a well-traveled spot. About 50 people from shipping, engineering, personnel, manufacturing and other departments at California Computer Products, Inc.'s digitizer division track by the machine daily.

"It's kind of a pathway they use through the building," according to Connie Grennan, accounting supervisor for the firm.

Grennan said she was concerned that an unathorized passerby might access the Personal Computer's operating system and wipe out financial files.

The digitizer division of Calcomp, a Sanders & Associates, Inc. subsidiary, manufactures components that are shipped to distributors and other Sanders facilities. The Personal Computer XT maintains the division's in-house financial records, handles management report generation, word processing and data base management.

When a user turns on the Personal Computer, its operating system comes up. With some computer knowledge, a user can access the operating system and erase it, Grennan said.

The digitizer division's accounting department keeps backup copies of all its files and could restore any deleted information if necessary, Grennan said. But instead of relying on this time-consuming, after-the-fact solution, she sought an alternative that would prevent unauthorized access in the first place.

Internal security

Grennan purchased an internal security board, Stoplock IIR from SDI, Inc., that uses passwords to prevent unauthorized micro use.

With the product installed in the micro, a user must type in a password to access the operating system screen. Only the seven members of Grennan's accounting staff have passwords.

The security board, a printed-circuit card, also provides an audit trail that records attempted accesses to the system for later readout. "Now I can go back and trace who's used the computer," Grennan said. "I feel more comfortable and safe with the security board installed since only accounting staff can enter and retrieve data."

Application developer keeps insurance firm up-to-date

Stiff competition prompting need for increased flexibility from information services

LINCOLN, Neb. — Deregulation in the financial and insurance industries has introduced stiff competitive pressures to expand services, develop marketable products and respond quickly to opportunities. In order to avoid falling victim to the current shakeout in the financial services industry, a large insurance company here decided to adjust its information processing strategies to the hotly competitive environment.

Bankers Life Nebraska, a $940 million institution with headquarters here, is branching out in such areas as financial services, securities and other investment-oriented products. It is also in the process of revamping its information services capabilities as one key weapon in its search for optimum profitability.

"Making information more accessible and readily helpful to our users is a foundation of our continued success," said Michael Jaskolka, assistant vice-president of information services. Jaskolka manages a 14-person department responsible for supporting the growing information demands of headquarters and sales offices located in 42 states.

More accessibility needed

Given the intense competitive pressures of the industry, Jaskolka said he believes that the information services function must adopt a new flexibility, one which is more immediately accessible to users at all locations. To that end, Bankers Life has a network of close to 200 personal computers and a five-member technical group dedicated to developing micro-based, point-of-sale products for the sales force.

"We're committed to removing as many obstacles as possible to our users' ability to recognize and seize opportunities, because effective decisions are based on accurate, timely and meaningful information," he said.

In its effort to improve its information services, in mid-1983 Bankers Life began converting from a Sperry Corp. 1100 system to an IBM environment. In a parallel effort, it made a commitment to on-line processing. Last year, the firm installed an IBM 3083 and began the laborious process of transferring files. Simultaneously, it installed a fourth-generation application development tool to meet its on-line development requirements, Jaskolka said.

After considering other development tools by Informatics General Corp. and Pansophic Systems, Inc., Bankers Life selected Oxford Software Corp.'s User Files On-Line (UFO) program, which it now uses for all of its on-line processing requirements, according to Jaskolka.

"My primary selection criterion has always been vendor service," Jaskolka said. "In terms of vendor commitment to its product, as well as ongoing enhancements, UFO fit Bankers Life's requirements best. We determined that UFO is the most widely used applications development tool in the CI"S environment," he added. "That carried a lot of weight with us."

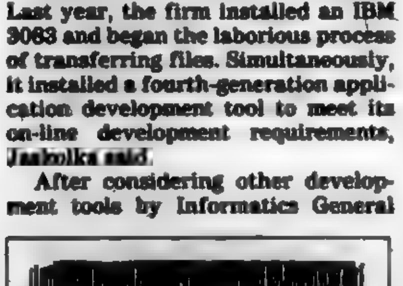
Until mid-1983, the Sperry 1100 handled virtually all of the firm's data processing requirements. Primarly a batch system, the insurance company's DP department was able to offer very limited on-line capabilities. Users and programmers alike were frustrated by slow turnaround in application development, Jaskolka said.

Almost immediately after the installation of the 3083 and UFO, Bankers Life noted a substantial increase in both the quantity and quality of information products, Jaskolka said. Applications that would have required two to three days to develop using traditional IBM CICS programming techniques could now be dispatched in as many hours using UFO, he said.

"Working as teams, programmers and users can work with UFO as a prototyping tool, modifying fields and data in real time to produce immediately useful products," he said.

"As far as shortcomings and problems, we haven't experienced any yet," Jaskolka said.

Future plans call for Bankers Life Nebraska to complete the migration to the 3083, making all information available to users at headquarters and sales offices, Jaskolka said.



'All week long I've felt like a micro-computer in the mainframe of life.'

Cut Information Retrieval Down To Size

...with BRS/SEARCH— the Software That Comes In Mainframe, Micro and Mini Sizes.

BRS/SEARCH, the same information retrieval software that runs one of the world's largest online database systems is now available for your mainframe, mini, or micro computer.

BRS/SEARCH gives you instant access to all your own information, regardless of its length or format. Many powerful, easy-to-use features developed through millions of online searches have made BRS/SEARCH the system of choice among information professionals.

BRS/SEARCH runs on IBM and compatible mainframes, as well as 16 and 32 bit mini and micro computers. And because the search query language is the same no matter what size computer, you can use it on a variety of systems without any additional training.

For more information about these three new sizes of database software, call toll free: (800) 833-4707; In New York State (800) 553-5566. Or write BRS Software Sales Support, 1200 Rte. 7, Latham, N.Y. 12110. Dealer and OEM inquiries invited.

Close call with floodwaters convinces oil refining firm

OIL CITY, Pa. — Floodwaters that came too close for comfort to an oil refinery's computer center helped convince the firm of its need for a detailed disaster recovery plan.

On Feb. 1, 1982, water from Oil City's flood lapped at the door of Quaker State Oil Refining Corp.'s headquarters here.

In the data processing center — a few feet from the door — Al Tucker, manager of computer systems development, shut his equipment down and began moving tapes and forms to safety on the second floor. The water stopped rising a fraction of an inch short of the door.

If a similar disaster struck today, seven teams of DP employees would react according to a plan drawn up after the '82 flood that gives each team specific responsibilities for shutting down the system and moving the firm's processing to a commercial hot site.

According to John Rudolph, Quaker State's corporate security analyst, "We chose the team approach because it's simply impossible for one individual to perform all the tasks required."

> *'We kept the teams as much as possible within the DP function both for control reasons and because [DP staff members] are experts,'*
>
> — John Rudolph, Quaker State

Quaker State's seven disaster recovery teams are:

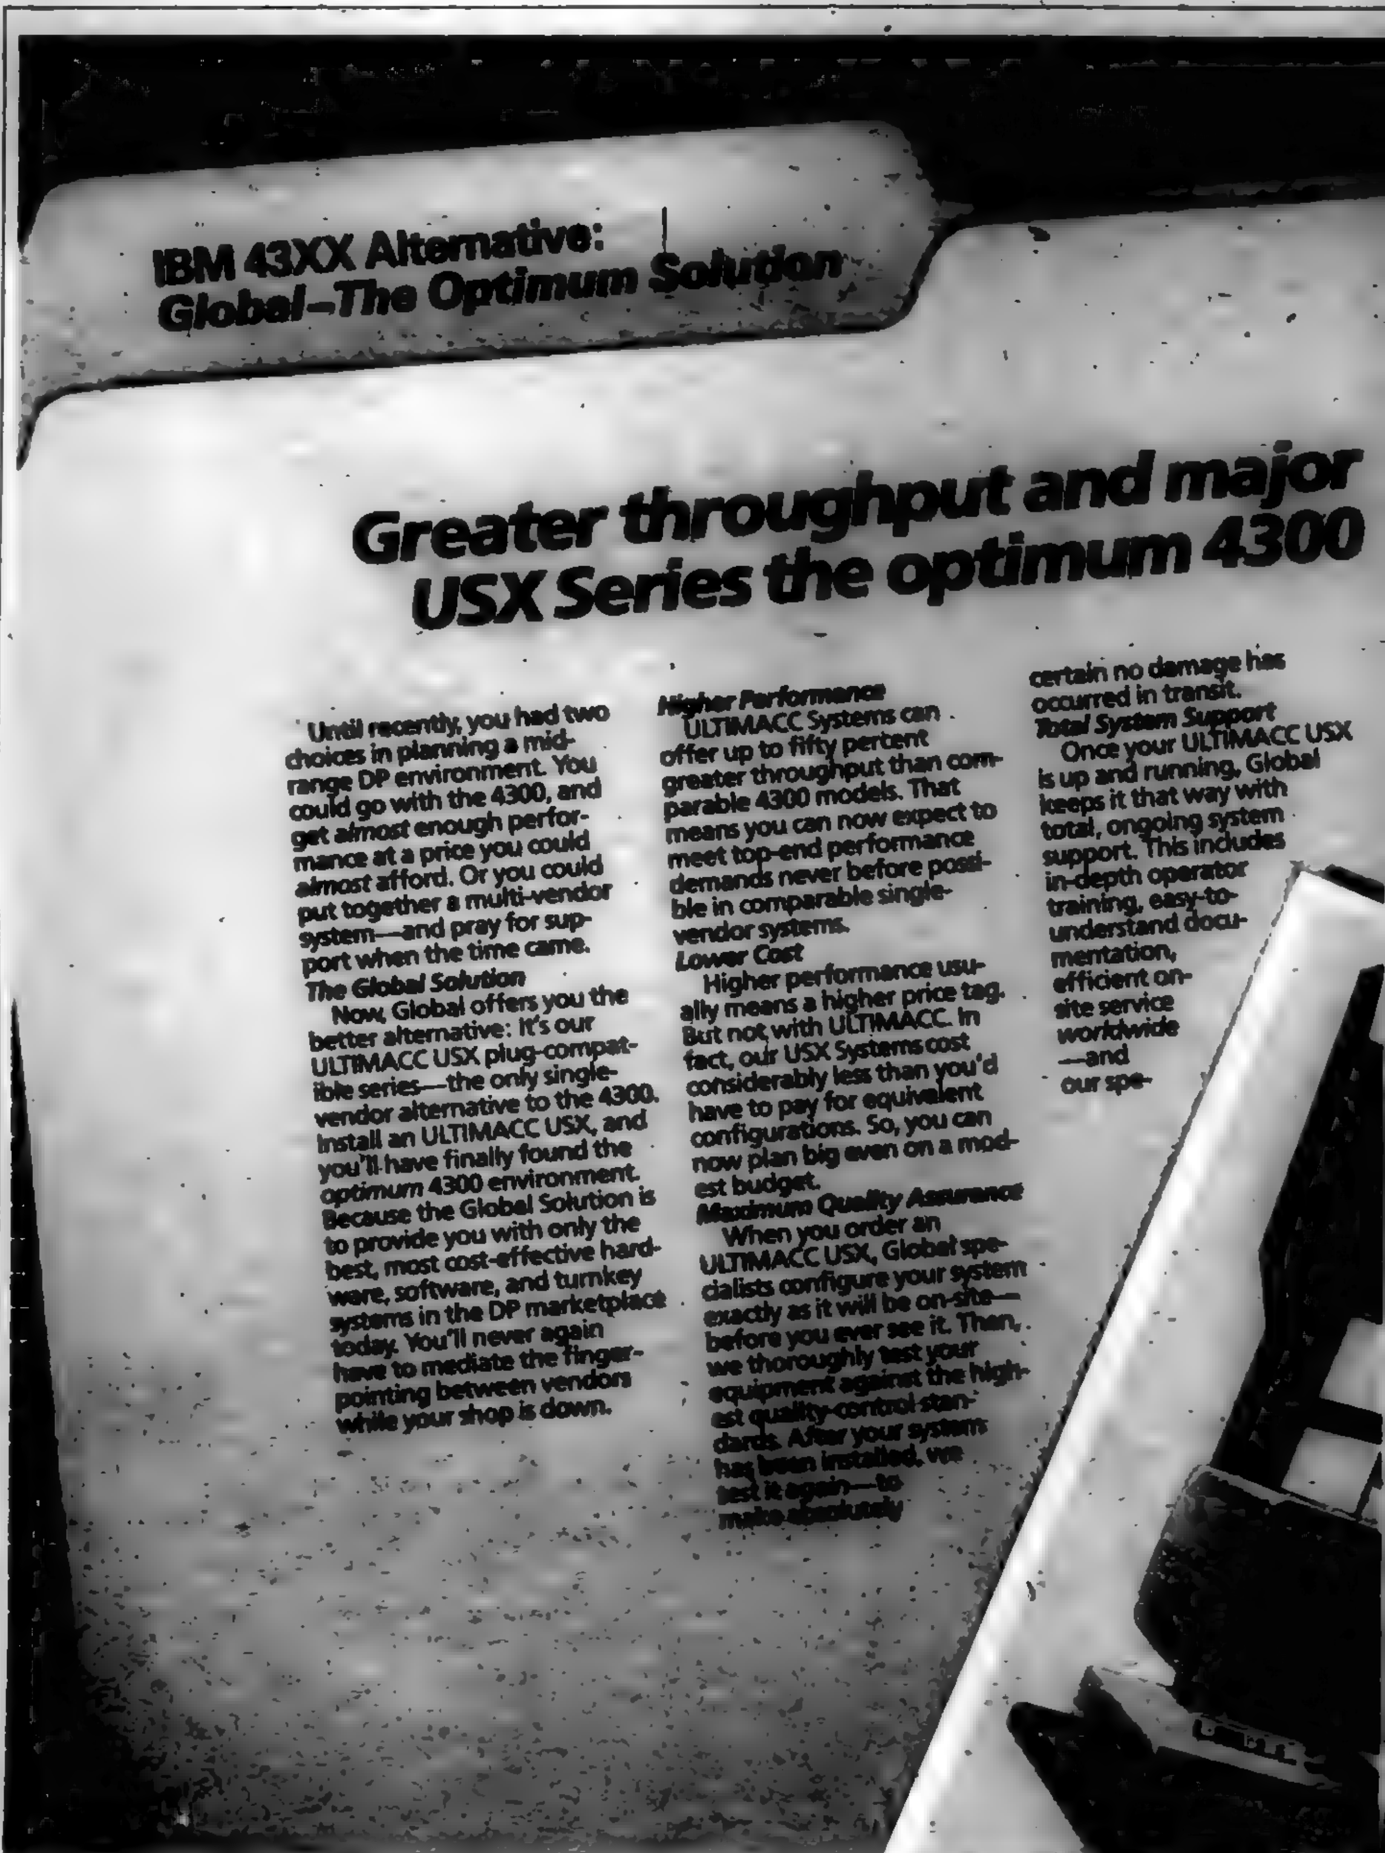
- The temporary processing center team, which performs operations functions.
- The software team, which ensures that the firm has an operating system at the hot site.
- The telecommunications team, which is responsible for establishing telecommunications and voice contact between headquarters and the hot site and among the various teams and all the firm's remote locations.
- The new hardware team, which evaluates damage to the equipment at headquarters and determines whether reconstruction or replacement is necessary.
- The application team, whose primary responsibilities are to get the systems up and running and work with users.
- The management administration team, which controls and coordinates all the activities and provides transportation, lodging and other necessary support.
- The salvage team, which assesses the damage, helps make recommendations regarding new equipment and salvages forms, tapes and anything else possible.

Rudolph said team members come from DP and are assigned to teams according to their areas of expertise. The software team consists of systems programmers and data base administrators; the applications team includes programmers and the firm's systems analyst; Quaker State's operations manager is a member of the temporary processing center team.

"We kept the teams as much as possible within the DP function both for control reasons and because [DP staff members] are experts," Rudolph said. "They know the terminology and the team breakdown is a data processing function."

A chart shows the teams steps that must be taken, in chronological order, to set up processing at the hot site. Each team meets with Rudolph quarterly to define its functions, put them into procedures and come up with planning requirements. All the plans are part of a disaster recovery manual.

If disaster strikes, some teams will relocate to the firm's recovery facility, RMI Co.'s Hotsite, in nearby Niles, Ohio. Some teams will stay in



IBM 43XX Alternative:
Global–The Optimum Solution

Greater throughput and major
USX Series the optimum 4300

Until recently, you had two choices in planning a mid-range DP environment. You could go with the 4300, and get *almost* enough performance at a price you could *almost* afford. Or you could put together a multi-vendor system—and pray for support when the time came.

The Global Solution

Now, Global offers you the better alternative: It's our ULTIMACC USX plug-compatible series—the only single-vendor alternative to the 4300. Install an ULTIMACC USX, and you'll have finally found the *optimum* 4300 environment. Because the Global Solution is to provide you with only the best, most cost-effective hardware, software, and turnkey systems in the DP marketplace today. You'll never again have to mediate the finger-pointing between vendors while your shop is down.

Higher Performance

ULTIMACC Systems can offer up to fifty percent greater throughput than comparable 4300 models. That means you can now expect to meet top-end performance demands never before possible in comparable single-vendor systems.

Lower Cost

Higher performance usually means a higher price tag. But not with ULTIMACC. In fact, our USX Systems cost considerably less than you'd have to pay for equivalent configurations. So, you can now plan big even on a modest budget.

Maximum Quality Assurance

When you order an ULTIMACC USX, Global specialists configure your system exactly as it will be on-site—before you ever see it. Then, we thoroughly test your equipment against the highest quality-control standards. After your system has been installed, we test it again—to make absolutely certain no damage has occurred in transit.

Total System Support

Once your ULTIMACC USX is up and running, Global keeps it that way with total, ongoing system support. This includes in-depth operator training, easy-to-understand documentation, efficient on-site service *worldwide* —and our spe-

# of urgent need for data center disaster recovery plan

Oil City, and some will be split between the two sites. In addition, Hotsite personnel will be on hand at the recovery facility to help correct hardware and software problems as they arise, Rudolph said.

According to the team recovery plan, disaster recovery will begin with the temporary processing center team, which will initiate a planned shutdown procedure at the DP shop. The management team will meet and decide whether to relocate operations to the hot site. If the decision is made to use the hot site, the management team notifies team members.

The management team will also establish a command post from which it can coordinate the recovery operation. It will notify the hot site to prepare for disaster processing and will arrange transportation for team members.

The temporary processing center team will obtain backup tapes and other material from Quaker State's off-site storage facilities. At the same time, the salvage team will coordinate security with civil authorities and begin to assess the damage on-site so it can advise the new hardware team on how to proceed.

Then the management, software, communications and applications teams will leave for the hot site. The management team will keep a representative at corporate headquarters and send one representative to the hot site. These representatives will coordinate site activities and handle contingencies and disputes as they arise.

At the site, the software team will restore the operating system. Concurrently, the applications team will work with the firm's users to establish a start-up strategy for disaster processing.

The software team will then run tests on the operating system. At the same time, the communications team will begin establishing links between remote sites and the backup operating system.

The temporary processing center team and the application team will then begin restoring the data base. They will run jobs to prepare the system to start operations.

The temporary processing center team will also schedule critical applications such as order processing, payroll and inventory according to the number of functional terminals the firm has available for use. Concurrently, the communications team will test data communications links and work out any bugs.

When all these arrangements are complete, the backup system will begin to process data. The temporary processing center team will take responsibility for normal operations. "We [will be] up, hopefully, and running just as we were at our own site," Rudolph said. The applications team will guide users through disaster processing procedures.

By the time operations are running at the hot site, the new hardware team at the headquarters will have begun contacting vendors for replacement equipment.

Continual checking

Throughout the recovery process, a checklist ensures that each part of the plan gets accomplished in its proper order, Rudolph said. "Each team contacts the management team periodically to inform them, 'I am ready to start point B.' If the other parts of the plan are in place, they will be told to continue; otherwise, they will wait."

Since the recovery plan was put in place, the Quaker State teams have performed one partial disaster recovery test. The firm plans to schedule a complete simulated disaster within the next three months.

One of the reasons Quaker State chose Hotsite as its recovery facility was the center's promise to grant unlimited disaster testing time during Quaker State's first year under contract, Rudolph said. Hotsite offered this benefit and reduced rates to all of its charter customers.

cial Global Systems Hotline, which is ready to help you solve problems 24 hours a day, 365 days a year.

Discover the Global Solution

Building the best possible DP solutions to your growing business needs isn't easy. But that's exactly what Global-USI is doing every day —with proven, quality systems like our ULTIMACC USX Series.

A Subsidiary of Global-Ultimacc Systems

Letter shop uses minicomputer to get its messages out

NEW YORK — Travel advertisements showing white sands, blue water and a sailboat are meant to make a viewer seek more information by mailing in the coupon clipped from the bottom of the ad.

The advertisements make it easy for the viewer to respond. This is part of advertising programs that depend on responses to define when, how and where to advertise. The potential customer's only concern is to send in the coupon and get back the booklet as soon as possible.

However, when the customer mails the coupon, they set in motion a chain of events called fulfillment.

Although the reply is to what appears to be an airline office, the airline will probably never see the inquiry. Between the customer and the airline is a letter shop — an organization that specializes in fulfillment of such information requests.

One such letter shop is Associated Litho and Letter Service, Inc. (AL&L) here, which handles fulfillment for a major European airline and other clients. Joel M. Weiss, who operates the letter shop, took over the 65-year-old business from his father 30 years ago.

"The advertising campaign begins with the need to promote a function of an airline," Weiss said. "It can be summer vacation travel, winter ski travel or executive business travel. It also could support cargo sales for the airline. When the advertisement is designed, a booklet or brochure to be used for inquiry response also is designed." The letter shop will keep a supply of the booklets in its inventory.

AL&L may keep 332,000 copies of 80 different pieces of literature awaiting inquiries from one client's advertising campaigns.

Inquiries are delivered directly to the letter shop, where a mailing label is prepared, the proper items are selected and packed in an envelope, the label, with information indicating which booklets are enclosed, and postage are affixed to the envelope and it is put in the mail.

"Timeliness is an important part of our function," Weiss said. "We try to mail a fulfillment within 24 hours of the time we receive a response. After all, if a person is interested in something, they want information as soon as possible. If it takes too long, they probably will lose that interest," he added.

"Although the functions we perform today are almost the same as they were 30 years ago, the way we perform them is constantly evolving with technology," Weiss said. "The latest is the addition of a minicomputer that we use to print labels and letters and to compile our reports."

Weiss noted that a computer works only as well as its programming and that only a few vendors had any software that could work in a letter shop environment.

"One package, including software and a Mentor minicomputer produced by Applied Digital Data Systems, Inc., fit our needs almost exactly," Weiss said. "The programming was written by Software Marketing Associates in Wethersfield, Conn. They know the letter shop industry well, and since our installation, they have sold four more systems in the New York area."

Before computerization two years ago, AL&L did everything manually. When inquiries were received, labels were prepared on a typewriter, and all reports were hand-calculated and typewritten. Repetitive letters were printed, with the name, address and salutation manually filled in by typewriter.

As long as volumes were low, this system was satisfactory. However, AL&L now processes over 100,000 inquiries a year just for one client. Its other clients add to that load.

"We still have to input the data through a keyboard much the same as we did with the typewriter," Weiss said, "But there the similarity stops. Once we have captured the data, there is almost no limit to the ways we can use it."

AL&L operates an Adds Mentor 4000 with 256K bytes of core memory and 300M bytes of disk storage. The system runs five CRT terminals and two printers, a 300 line/min line printer and a 55 char./sec letter-quality character printer.

One key report Weiss uses is the daily inventory report to keep count of all the pieces of literature. Before computerization, the letter shop often ran low on specific brochures before any shortage was apparent. Now, every piece of literature is deducted from inventory when the labels are processed. Literature is added to the inventory as it is received, and the daily report shows the balance on hand.

Another by-product of the data entry is the activity report, a tally of all inquiries, listing the source (ad coupons, responses from mailings, telephone calls), literature sent and other information.

"With our old manual system, it used to take hours to calculate and type this report," Weiss recalled. "Now it only takes a few minutes to compile in the computer and another 30 seconds to print. This is a tremendous time savings."

As a profit center, the system has contributed to a 50% increase in revenue with a corresponding 25% hike in profitability, he said.

The PHOENIX/Micro™ System Means Total Training Flexibility.

Mainframes to PCs, the one computer-based training solution is the PHOENIX® System. Only with PHOENIX® are all mainframe course development and training management facilities transportable to the IBM PC. Only with PHOENIX® does a complete vendor support system stand behind every product user. And only PHOENIX® provides flexible pricing for companies with large numbers of micros. Call today for a PHOENIX® demonstration.

Over the last three years, PHOENIX® has become the new standard for developing computer-based training. The world's largest EDP training vendor has standardized on PHOENIX® Companies with widespread training needs have standardized on PHOENIX® The system is being incorporated as a new feature into many of the most widely used software products available today.

The reason is simple: PHOENIX® makes interactive computer-based courses easy to create. And it makes the training function easy to administer.

To support PHOENIX® users, Goal Systems provides telephone hot-line support, national and regional user groups, consulting services, a regular newsletter on CBT technology, and training courses in the many facets of developing computer-based courseware.

Mainframes to PCs, no other system has the training power or the support of PHOENIX®

Call today for your own, personal demonstration of the PHOENIX/Micro System. PHOENIX® : the only CBT training system that's Good as Goal.

Goal Systems
Software Solutions

The PHOENIX/Micro System is available only to licensees of the mainframe version of the PHOENIX® System.

Dasd program eases daily backup for power company

HOUSTON — A power company here found it was gathering a multitude of problems backing up data for a nuclear power plant construction project.

Daily backup of a Houston Lighting and Power Co. (HL&P) data center here was smoothed through use of Dasd management software, according to HL&P senior programmer Robert Lauderdale.

The Dasd software allows the data center to back up its day's processing onto five tapes — instead of the 26 tapes needed by the previous Dasd software. It has also reduced backup time from "an eight-hour-a-day, five-day-a-week job" to one to two hours nightly, Lauderdale said. The data center using the Dasd software is the main computer center for the South Texas Project (STP), a nuclear power plant being built by HL&P 100 miles away.

The Dasd software, DMS/OS from Sterling Software Marketing, is also being used to keep track of Dasd usage in the data center, where data storage demands have required the facility's 20 IBM 3350 spindles to be replaced by 36 spindles of 3350-compatible Amdahl Corp. 6280s in this year alone. The center also has 16 spindles of IBM 3380 storage.

Lauderdale said it took only about 10 days out of the software's 30-day trial period before the data center was sold on it. "What really sold us on DMS/OS was that after we installed it, I had to leave for a day. I told one of our senior programmers that I had just installed a new system and that it ran under SPF. I told him to go through it to see what he could do with it and that when I came back, I'd give him another report on it," Lauderdale said.

"When I came back the next day, he had successfully completed nearly every function that DMS/OS had to offer, in the simulate mode, without ever touching the manual."

Among DMS/OS's features, Lauderdale praised its volume configurator, which provides the ability to move data between Dasd devices. He said the volume configurator was useful when HL&P-STP made its switch from 20 to 36 spindles. Lauderdale added that he was pleased with the product's ability to migrate individual data sets to selected disk packs. "We did a complete migration of all 20 spindles in about four hours," he said.

Lauderdale praised the product's Structured Programming Facility interface. "[It] generates the JCL for you, so you don't even have to save it every time — you can save it one time, and it's always there."

The software, he added, also aids disaster recovery. In December 1983, an operational error cost a week's worth of data in the backup. "DMS/OS came to the rescue and brought us right back up to tape," he noted. "Our recovery time was less than 24 hours from our disaster."

Meet to cover high-tech mart in China

NEW YORK — The outlook for market opportunities in the computer and high-technology industries in China will be among the topics discussed at the second national conference on doing business with China, Dec. 3-4 at Stouffer's Concourse Hotel in Arlington, Va.

Sponsored by the Energy Bureau, Inc., the program was created for executives and officials from industry and government who are responsible for trade agreements with China.

Presentations will describe the negotiations as well as the current economic, political, legal and regulatory climate in U.S.-China trade relations.

Speakers at the conference include representatives from China Energy Ventures; the Chinese Embassy; the U.S. China Industrial Exchange; Touche Ross and the U.S. Department of Commerce.

Futher information is available from the Energy Bureau, 41 E. 42nd St., New York, N.Y. 10017.

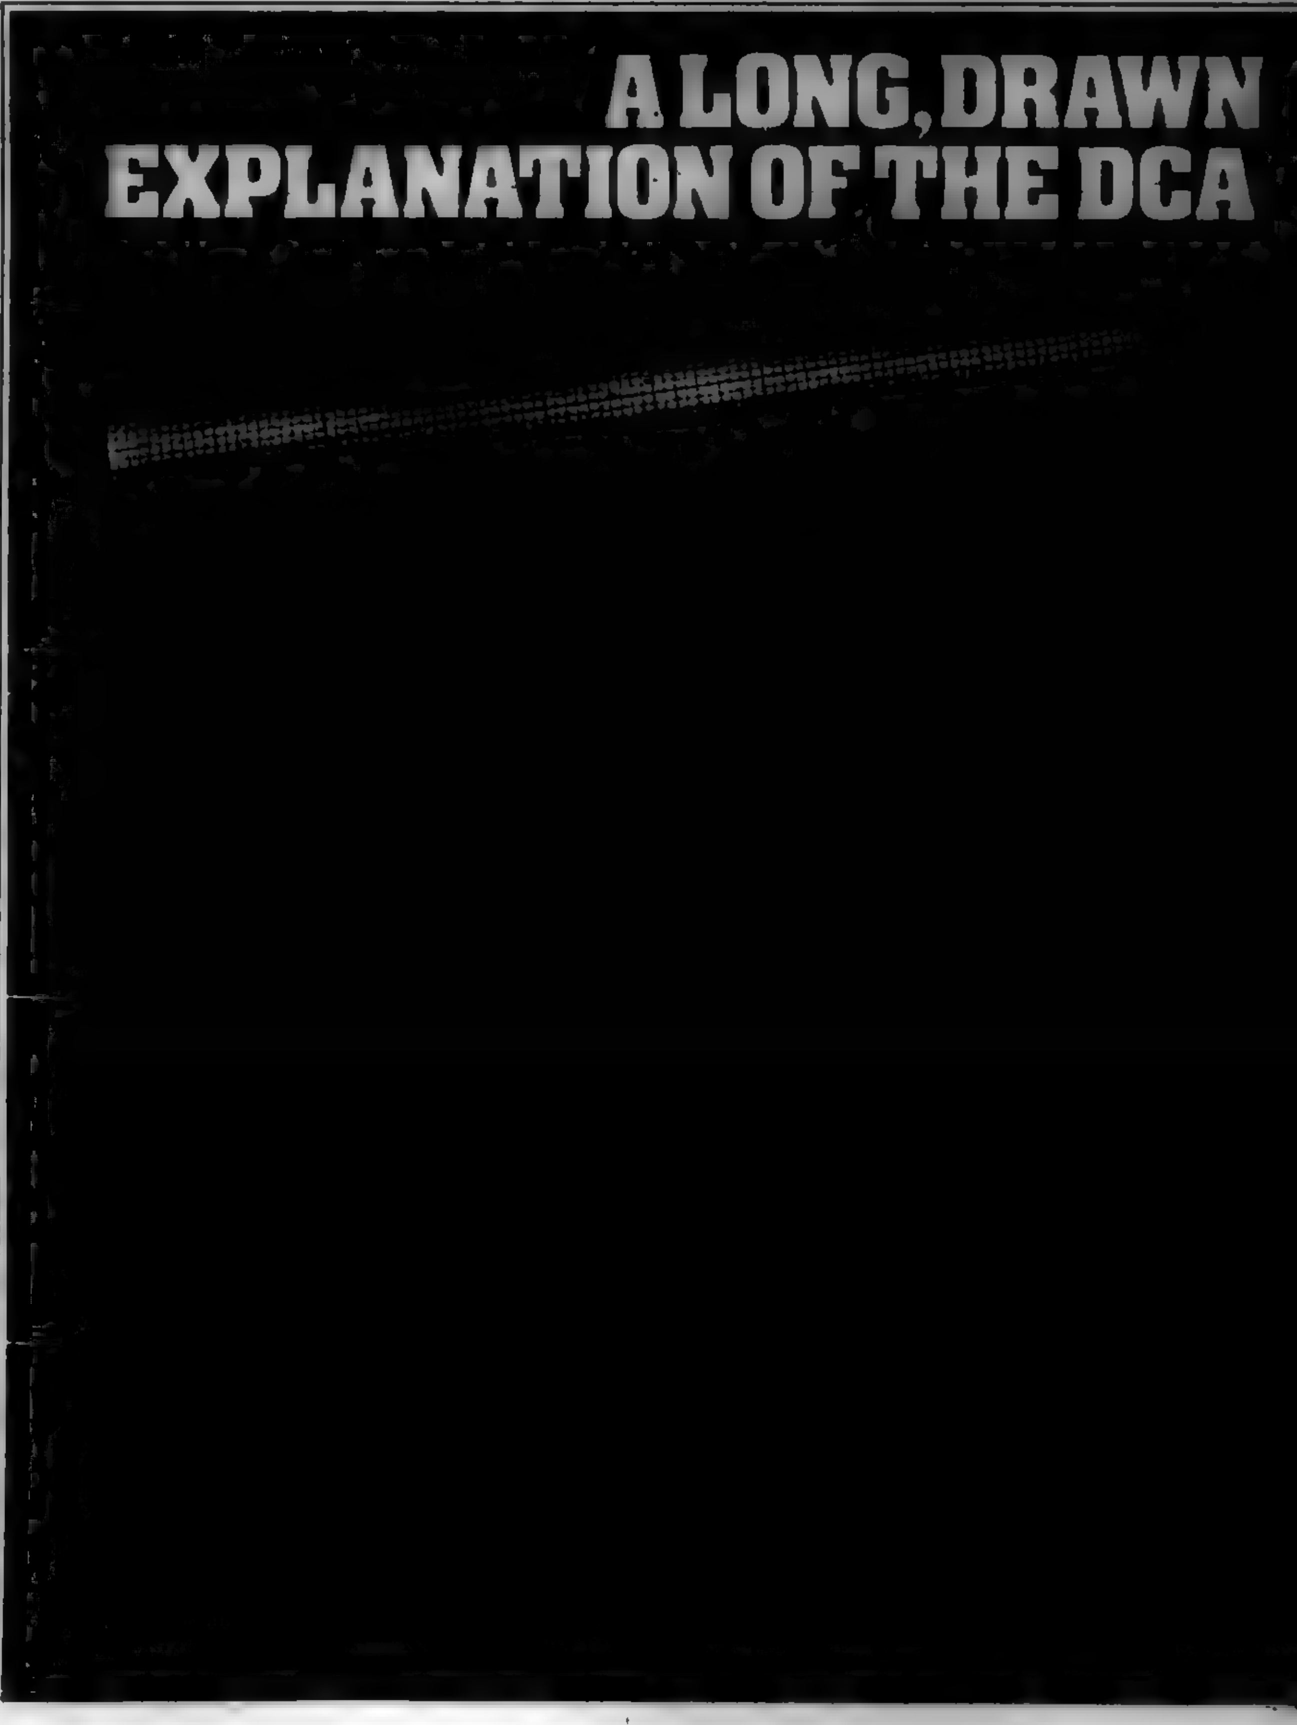
IBM micro role topic of seminar

SAN FRANCISCO — A one-day seminar focusing on the technology and market impact of several IBM microcomputer products will be held Nov. 29 at the Hyatt Regency Embarcadero here.

Sponsored by Future Computing, Inc., IBM products to be discussed at the meeting are the IBM Personal Computer, the Personal Computer AT, the Topview operating environment and the PC Network.

Future Computing President Portia Isaacson and other company executives and analysts will speak at the meeting. Registration is $600 — $480 for Future Computing clients.

More information is available from Future Computing, 8111 LBJ Freeway, Dallas, Texas 75251.



Citibank stalks software for data, user protection

NEW YORK — Concerns about data privacy kept some users from taking full advantage of office automation tools at Citibank here and posed a threat to one of the firm's technological goals.

"The thrust of our office automation effort is to enhance our management's capabilities, to integrate technology in a way that they can use it," according to Richard W. Coughenour, Citibank vice-president and director of office automation.

In line with this goal, Citibank connected more than 500 micros, mostly IBM Personal Computers, to its in-house EZmail telecommunications system, which operates under the firm's mainframe, a Tandem Computers, Inc. Nonstop-TXP. Citibank encouraged managers to use the personal computers for off-line report preparation and for on-line messaging via EZmail.

But, Coughenour said, some users worried about keeping their data secure and continued to process paper transactions. Managers expressed concern about open access to information in local storage, he said, because they said that they felt employees who were authorized for general access could also access confidential information.

Users also perceived problems with sending their private messages through electronic mail. "Some of our people kept even routine correspondence off the system because they were not quite sure who would see it," he said.

Citibank searched for a security system that would address these worries, Coughenour said. "I wanted to reassure people, to let them know that we recognized their concerns." But at the same time, he said, "I didn't want a solution that was so complicated it would keep people away from their [micros]."

Security system criteria

Citibank looked for a security tool that would provide:

- Privacy for local storage.
- Compatibiltiy with telecommunications.
- An easy-to-use format.

The firm looked at hardware solutions that required users to open boxes with keys in order to access communications lines. He felt these systems were too difficult for users to install and use, he said. "I didn't want to raise more obstacles to acceptance and use of our system."

The hardware solutions were also too expensive. Coughenour said an average lock-and-key system costs about $20,000 to secure three or four lines.

Citibank chose a software solution called P/C Privacy: Personal/Confidential from Mctel, Inc. that cost Citibank about $100 for every personal computer it wanted to secure.

P/C Privacy software uses an algorithm to encrypt files. Users encrypt their files using a key phase that they select. If someone who does not know the key phrase calls up the encrypted file in local storage, he will see a garbled message. All characters within the encryted file fall into printable Ascii range, allowing the encrypted file to be sent via communications lines. Data recipients can decrypt the file only if they know the key phrase.

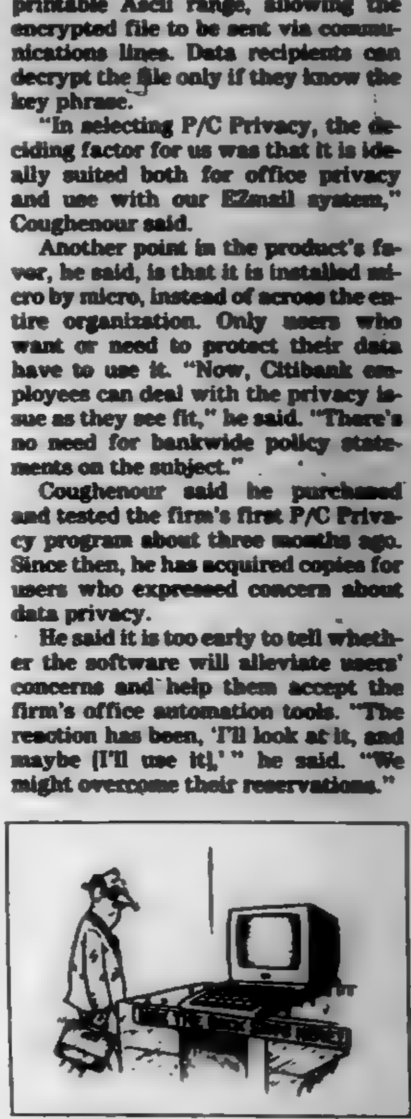
> *'The thrust of our office automation effort is to enhance our management's capabilities, to integrate technology in a way that they can use it.'* — Richard W. Coughenour, Citibank

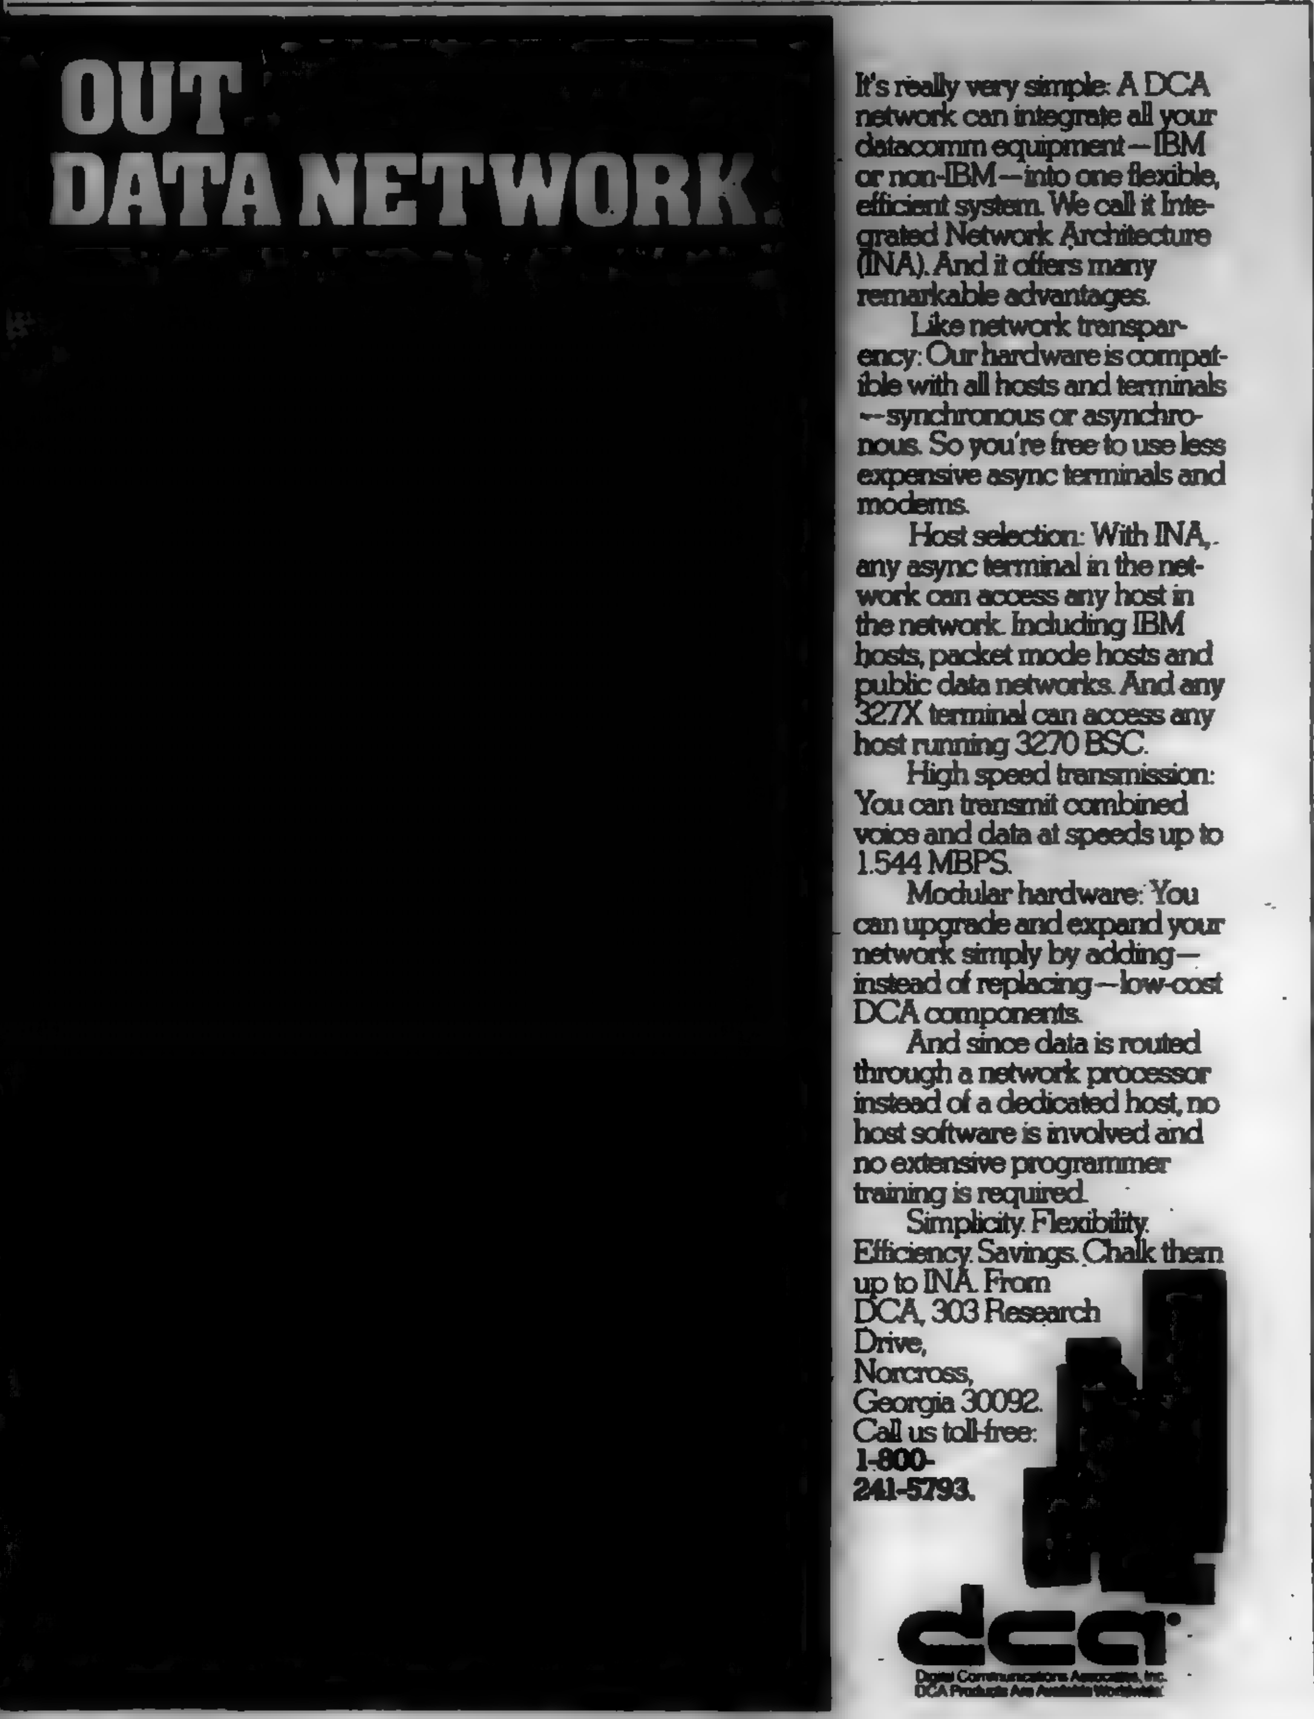
"In selecting P/C Privacy, the deciding factor for us was that it is ideally suited both for office privacy and use with our EZmail system," Coughenour said.

Another point in the product's favor, he said, is that it is installed micro by micro, instead of across the entire organization. Only users who want or need to protect their data have to use it. "Now, Citibank employees can deal with the privacy issue as they see fit," he said. "There's no need for bankwide policy statements on the subject."

Coughenour said he purchased and tested the firm's first P/C Privacy program about three months ago. Since then, he has acquired copies for users who expressed concern about data privacy.

He said it is too early to tell whether the software will alleviate users' concerns and help them accept the firm's office automation tools. "The reaction has been, 'I'll look at it, and maybe [I'll use it],'" he said. "We might overcome their reservations."





It's really very simple: A DCA network can integrate all your datacomm equipment — IBM or non-IBM — into one flexible, efficient system. We call it Integrated Network Architecture (INA). And it offers many remarkable advantages.

Like network transparency: Our hardware is compatible with all hosts and terminals — synchronous or asynchronous. So you're free to use less expensive async terminals and modems.

Host selection: With INA, any async terminal in the network can access any host in the network. Including IBM hosts, packet mode hosts and public data networks. And any 327X terminal can access any host running 3270 BSC.

High speed transmission: You can transmit combined voice and data at speeds up to 1.544 MBPS.

Modular hardware: You can upgrade and expand your network simply by adding — instead of replacing — low-cost DCA components.

And since data is routed through a network processor instead of a dedicated host, no host software is involved and no extensive programmer training is required.

Simplicity. Flexibility. Efficiency. Savings. Chalk them up to INA. From DCA, 303 Research Drive,

Package cuts outstanding claims for water heater firm

KANKAKEE, Ill.— A leading manufacturer of water heaters improved its credit management control and reduced outstanding claims by more than $700,000 after converting from a manual card system to an accounts receivable software package.

Tom Van Himbergen, vice-president and controller of the Water Products Co. here, a division of A.O. Smith Corp., said that in 1980 he was given the task of strengthening the company's financial systems to make the company more profitable.

A primary concern was to tighten control of accounts receivable, Van Himbergen said. A.O. Smith had a manual system with 25,000 transaction cards, he said. The record-keeping system had not been updated in recent years, and audit trails were difficult to follow, he said.

The old batch system provided almost no customer history and had limited cash posting capability, Van Himbergen said. Some of the cards were unusable because they were so worn, he added. Van Himbergen decided that a new approach was needed if A.O. Smith intended to hone its competitive marketing edge in the future.

Expanded customer base

"When we added two plants on the West Coast and then one in South Carolina, we broadened both our shipping and our customer base," Van Himbergen said. After evaluating several software packages, A.O. Smith selected the accounts receivable system from Management Science America, Inc. (MSA) of Atlanta.

The system was installed at the company's central computer facility in Milwaukee on two IBM 3033 multiprocessors running under IBM's MVS/CICS operating system, said Russell Bordewick, manager of systems. "This was the first true on-line system on the hardware, and the technical people had some problems getting CICS up," he said. "But there have been no problems with the software."

The company needed quick, timely access to information, current credit inquiry capabilities, automatically generated audit trails, real-time cash posting facilities and price remittance audits, said Ken Larson, assistant credit manager and a member of Van Himbergen's project team. It also needed a system that could capture the full credit history of customers and manage claims and discounts, he added.

The team Van Himbergen set up to investigate accounts receivable packages looked at three or four other packages, but none of the other vendors could show the team a similar manufacturing company that was using its product, Larson said. They decided against building a system in-house because it would take too long and cost too much, he said.

"The system gives us immediate credit exposure on all our customers," Larson said. "With the on-line screens, we know what was shipped and billed as recently as the most current posting. We know what's been paid, how it was applied and what's still outstanding. We're able to make decisions based on trustworthy data."

The old batch system provided almost no customer history and had limited cash posting capability. Some of the cards were unusable because they were so worn.

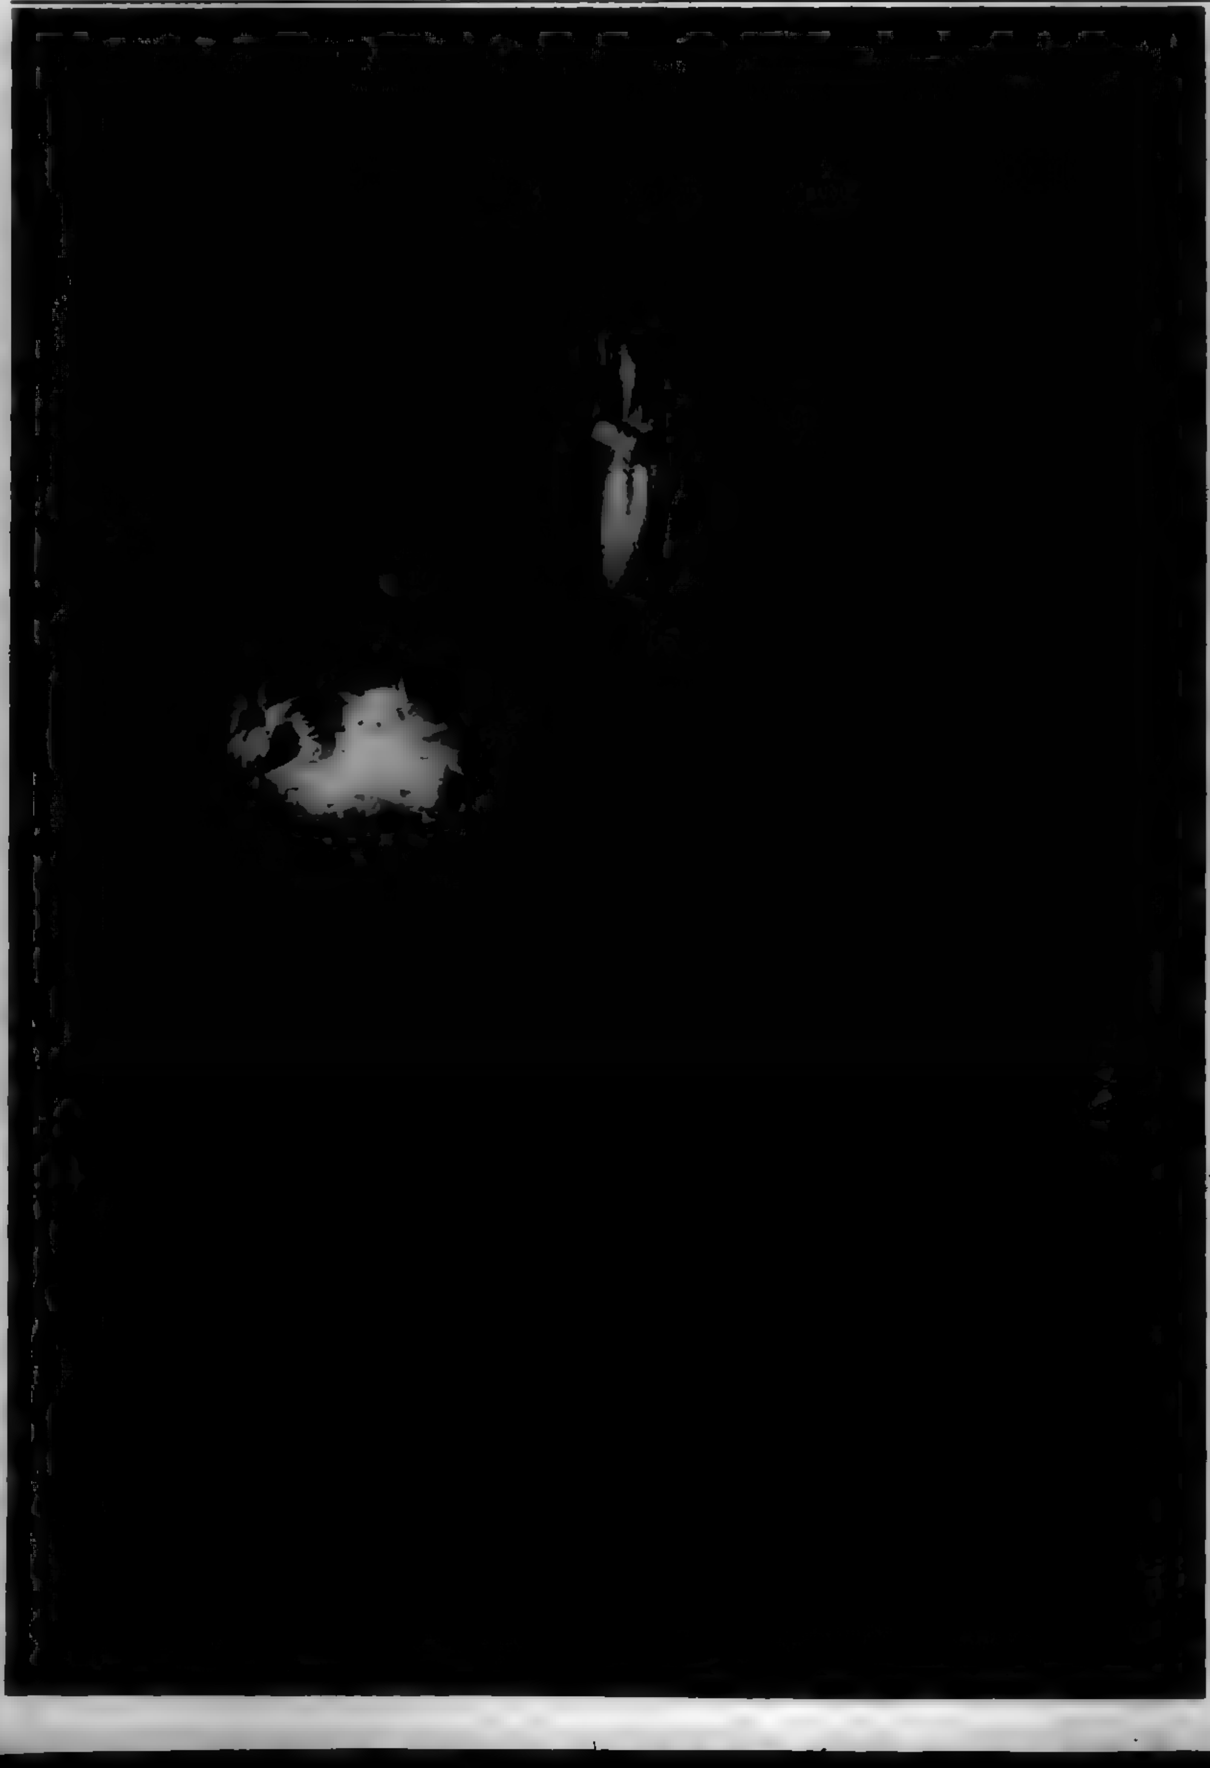
Before, when customers made claims for discounts or price reductions, there was no way of going back to determine if they qualified, Larson said. With the new system, discounts are monitored against time and amount parameters set up by accounting managers, he said.

If the claim does not fit the parameters, the amount is automatically charged back to the customer, Larson said. This saves A.O. Smith as much as $500,000 a year in unresolved claims that they once had no choice but to write off, he added.

The new system cut the average life of a claim in half and reduced the amount of outstanding claims from $900,000 to less than $200,000, Larson said.

The MSA accounts receivable system allows the user to get daily reports on audit trails, batch proof lists, proofs and balances, journals and closed-term histories, and four kinds of month-end aging reports, in sharp contrast to the two reports produced by the old system at the end of each month, Larson said.

Larson said he is looking forward to the next version of the package, which the company plans to install next spring, because it will give sorting options on aging reports or statements. Credit people like to review items by age, with the oldest items being on top of the page, Larson said. The MSA system sorts by reference numbers, which are not sequential at A.O. Smith because of multiple billing systems, he said.



Decision software gives firm's data lateral mobility

DALLAS — Zale Corp. here has grown from one jewelry store, opened in Wichita Falls, Texas, by brothers William and Morris Zale in 1924, into the largest retail jewelry operation in the world.

Unusual among retailers, Zale's operations are vertically integrated. Zale purchases its diamonds from De Beers and then cuts, polishes and mounts them for sale in more than 1,500 worldwide stores, catalog showrooms and other outlets.

At Zale, a broad base of end users, including divisional managers and vice-presidents, use Comshare, Inc.'s System W decision support software running on an IBM 3084 mainframe. Many applications are in the corporate planning area, which is responsible for the strategic and annual business plans, general financial analysis, checkpoint review of capital expenditures and coordination and control of acquisitions and divestitures.

"Right now," said Gene Morphis, senior vice-president of corporate development, "we are using System W heavily in our strategic planning process. We maintain a five-year forecast by business unit that is constantly updated and the results consolidated."

Morphis pointed out that Zale's hierarchy model is not a typical one because of the firm's financing division. This credit division is influenced by the sales in other divisions and, in turn, passes its expenses back to those divisions.

"Most modeling languages are built to pass data up a hierarchy, and those products are a dime a dozen. What they don't do well is pass data across the model, or sideways. System W's data base structure makes it simple and straightforward to model the relationships between our credit and other divisions," Morphis said.

Sales-demand forecasting at Zale uses System W's statistics and consolidation capabilities. "We use [Standard Metropolitan Statistical Area] data that must be consolidated and allocated any number of ways to form market estimates," Morphis explained. "The same data is rolled up many different ways, and System W handles that effectively," he added.

'Working tool for management'

Catalog sales are a rapidly growing jewelry market, and a model has been developed that Zale uses to optimize the return on catalog showroom floor space. "This is one of the more exciting things we are doing. It provides a whole new dimension in evaluating stores. It is more than a primitive pro forma based on percentage of sales figures. It is a working tool for line management," Morphis said.

In looking for a decision support package, only nonprocedural languages were considered. All concerned at Zale agreed that the time needed to write something in a nonprocedural language is a fraction of the time needed in a procedural language, according to Morphis. Also, the software had to perform rigorous simultaneous equations. The software selected had to be capable of implementing the models Zale had already developed since 1980 on a time-sharing service, he said.

All of the products were good, Morphis said, but he noted that System W's data handling and data base management capabilities made the difference. It was also important that System W could be used on IBM mainframes, IBM Personal Computers or on Comshare's time-sharing service.

"Putting professional tools in the hands of professional managers — that's the way I'd sum things up," Morphis said. "System W is a working tool in the mainframe, and we expect a larger community of users over time."

$500,000

of venture capital available for the marketing of software products (Info Center, OA or System Utilities) that run under IBM's MVS/SP, VM/SP, DOS/VSE or CICS/VS.

Nobody puts ideas on paper so many ways.

If you're using your printer with a personal computer, you probably need one that can handle a variety of functions.

At the same time, the price should be in line with the computer itself. Low.

The pint-sized Dataproducts printer in the picture costs about as much as one good software package.

It prints spreadsheets, graphics and illustrations, labels, multi-part forms—even letters that look like they were typed.

But let's say you're running a big computer and it's hundred-page reports you need. Pronto. Or documents by the millions.

The printer on the right finishes a full computer printout page in less time than it takes to sneeze. At 2,000 lines a minute, it prints much faster than you can see. Three shifts a day. Year after year.

In between these two special-duty Dataproducts printers are whole families of other Dataproducts printers—daisywheel printers, non-impact printers, high-security printers for the government, and more.

In fact, we make more different kinds of computer printers than any other independent printer company in the world.

Very likely we make one that fits your needs exactly.

Write us at 6200 Canoga Avenue, Woodland Hills, CA 91365. Or phone (818) 887-3924. In Europe, 136-138 High Street, Egham, Surrey, TW 20 9HL England.

Dataproducts computer printers.

MANAGERS ON THE MOVE

The Department of the Treasury's Financial Management Service has announced the appointment of RONALD A. NERVITT as assistant commissioner for information systems.

Prior to his Treasury Department appointment, Nervitt was Technical Director with the Naval Intelligence Command, where he managed the acquisition of major computer systems and provided support services to a broad range of U.S. Navy analysts and administrators.

Nervitt has more than 25 years of experience in the computer field, having managed organizations within the U.S. Navy, the General Services Administration and the National Security Agency (NSA) that were responsible for planning, acquiring and operating major computer, telecommunications and secure systems and networks.

At the Financial Management Service, he will manage a staff of approximately 370 employees and oversee a similar number of contractor personnel who together provide system support and services to financial managers govermentwide.

During his tenure at the NSA, Nervitt was responsible for conceiving, planning and programming a number of computer-based cryptographic systems now used in both the government and private sector.

He has published numerous papers on computers and cryptography and received the Meritorious Civilian Service Award for outstanding contributions to the NSA.

He earned undergraduate degrees from Pennsylvania State University and American University, majoring in engineering and physics, respectively. He also holds an advanced degree from Johns Hopkins University.

■

Griffin

DENNIS W. GRIFFIN has been named director of management information systems for Indian Head Industries, Inc. in Southfield, Mo. In this position, he will be responsible for all data processing and management information systems at Indian Head.

Prior to his appointment, Griffin had been the company's supervisor of programming and systems. He joined the company in 1977 as an analyst programmer.

He attended Oakland Community College and the Control Data Institute.

Indian Head Industries is the parent company of Detroit Gasket, a major manufacturer of gaskets and soft trim components for the transportation industry, and MGM Brakes.

VAX™ SPREADSHEET WITH GRAPHICS

GRAPHIC OUTLOOK combines an electronic spreadsheet with full business graphics. GRAPHIC OUTLOOK interfaces to your DISSPLA®, SAS™, DI/3000®, or MGSP graphics software. Or you can license it complete with its own graphic software. Our 30 day demonstration tape includes the full spreadsheet with graphics.

— Horizontal and vertical bar charts, pie diagrams, line and scatter plots.
— Drives most popular graphics terminals and plotters.
— A 3-dimensional spreadsheet capability lets you link spreadsheets together.
— Reads and writes ASCII interface files.
— Journaling, sorting, cell labels, user-defined functions, cell edit.
— Special project scheduling functions.
— Extensive on-line help, and tutorials.
— With SPAWN command, communicates interactively with user-written programs that update worksheet values.
— Over 60 built-in mathematical, scientific, financial, statistical, and worksheet manipulation functions.
— Low resolution graphics provides bar charts and line drawings on VT100-type terminals.

Micro series scheduled

MINNEAPOLIS — Architecture Technology Corp. has announced a series of seminars covering issues in microcomputer communications in local environments.

The seminars, titled "Personal Computer Communication Systems," will cover communications technology, micro-to-mainframe links, advanced micro local-area network features and IBM's Personal Computer network strategy. The target audience includes strategic planners, DP managers, micro system designers and office automation professionals.

Scheduled dates and locations for the seminars are: Dec. 3-4, Washington, D.C.; Dec. 5-6, Orlando, Fla.; Dec. 10-11, Los Angeles; and Dec. 13-14, Honolulu. Preregistration is priced at $645, and onsite registration costs $845. More information is available from Architecture Technology, P.O. Box 24344, Minneapolis, Minn. 55424.

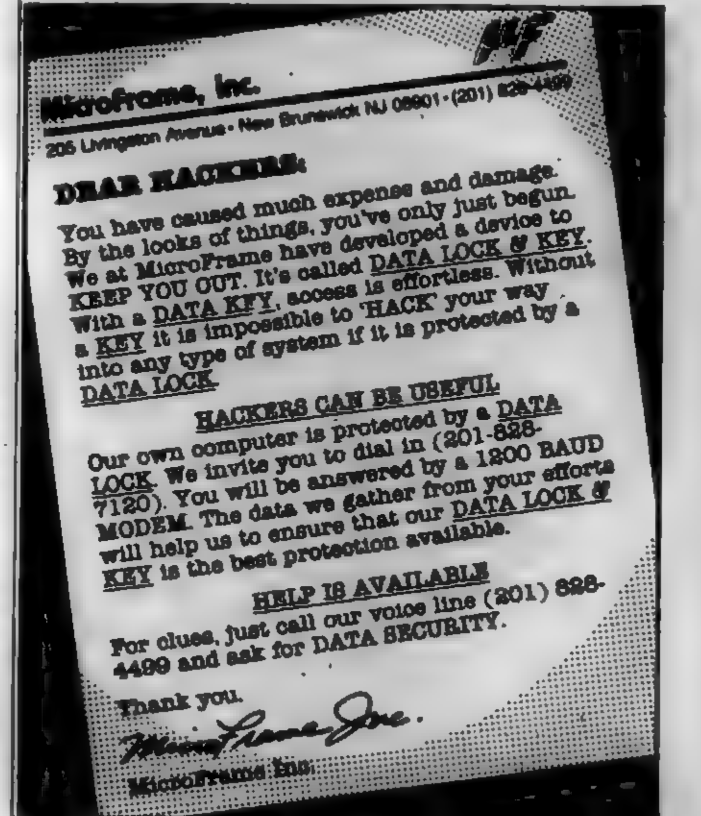
Retail expo set for N.Y.

NEW YORK — The National Retailers Business and Equipment Exposition will be held Jan. 13-16, in conjunction with the National Retail Merchants Association's (NRMA) 74th annual convention, at the New York Hilton and Sheraton Centre here.

"Retail Directions '85" will feature information and demonstrations on operating technologies, equipment and fixtures as well as product and services for retail use.

The exposition is free to retail industry members. More information is available from Dan Soskin, NRMA Enterprises, 100 W. 31st St., New York, N.Y. 10001.



MicroFrame, Inc.
205 Livingston Avenue • New Brunswick NJ 08901 • (201) 828-4499

DEAR HACKERS:

You have caused much expense and damage. By the looks of things, you've only just begun. We at MicroFrame have developed a device to KEEP YOU OUT. It's called DATA LOCK & KEY. With a DATA KEY, access is effortless. Without a KEY it is impossible to 'HACK' your way into any type of system if it is protected by a DATA LOCK.

HACKERS CAN BE USEFUL

Our own computer is protected by a DATA LOCK. We invite you to dial in (201-828-7120). You will be answered by a 1200 BAUD MODEM. The data we gather from your efforts will help us to ensure that our DATA LOCK & KEY is the best protection available.

HELP IS AVAILABLE

For clues, just call our voice line (201) 828-4499 and ask for DATA SECURITY.

Thank you.

MicroFrame Inc.

DunsPlus: The Micro Solution That Reflects The Way You Do Business

You've heard the buzzwords: user friendly, integrated, smarter, faster, cheaper. But when you push the rhetoric aside you're still asking the same question, "Why can't I get a system that solves more problems than it creates?"

You can. It's called DunsPlus and it's built to respond to your information-related business demands without creating demands of its own.

DunsPlus gives the IBM PC XT a built-in business environment. This lets you mold DunsPlus to fit the way you do business.

Within the DunsPlus environment is a software base of the best. Lotus, MultiMate, Western Union electronic mail (to name but a few), are all ready for immediate use. But additional programs to solve your unique problems can also be added with ease.

Instant, yet controlled, access to your choice of mainframes and subscription databases is also a part of the DunsPlus environment. And transferring data throughout the system is as easy as moving a piece of paper from the In Box to the Out Box.

Immediate end-user productivity is not an issue: DunsPlus is a menu-driven system requiring minimal keystrokes for maximum results.

Installation is not an issue: DunsPlus is installed by IBM.

End-user training is not an issue: Training and support are part and parcel of DunsPlus.

Flexibility is not an issue: Any part of the DunsPlus solution--hardware, software, or service--can be tailored to meet your precise business needs.

In fact, there are no issues. DunsPlus does what you want, the way you want it--now.

Designing systems that reflect the way you do business is business as usual for us. NOMAD2, the premier 4th-Generation-Language/DBMS from D&B Computing Services, has made us a leader in the field of information management services. And as your needs evolve, so do we. DunsPlus is just the latest step in translating technological advances into usable business tools --tools that reflect the way you do business.

TURNAROUND TIME

Larry Long

Q In the last six months a great deal has been said and written about expert systems. I've been asked to assess the feasibility of developing or purchasing an expert system for our company. I've located a company that claims to be developing an expert system in our field, but refuses to release any information on it. What do you believe the staying power of expert systems to be?

As buzzwords go, "expert systems" reigns supreme. Expert systems are now moving through the "clever and interesting" stage to the "useful" stage. The inexpensive, powerful technology that is just around the corner will catapult these memory-intensive expert systems into the ionosphere by mid-to-late 1985. But, herein lies the problem.

Just as every piece of management software was labeled a decision support system (DSS) during the last seven years, everything from now on will be labeled an expert system. It was fine to call software "DSS" because it used existing technology. Anyway, DSS was just a new name for an old concept. But, "real" expert systems rely on radically different technology and ideas.

My fear is that we will see dozens, if not hundreds, of expert systems catering to every imaginable market over the next few years. Most will be no more than DSS that use traditional data structures. This will make it difficult for the novice consumer to distinguish between a knowledge-based expert system and a fraud. In the inevitable rush to get these systems to the market, I expect many to be released prematurely. Expert systems are here to stay, but during this shakeout period, test-drive a system from coast to coast before buying it.

Q I, along with 30 other middle managers, received a bluntly worded memo from the president of our company that encouraged us to become computer-literate as soon as possible. Details were omitted.

Because I am the only middle manager with any semblance of computer knowledge, at least 10 others have asked me for guidance. I consider myself to be computer-literate, but the president's memo did not define it, so I don't know. At what level of knowledge does one become computer-literate?

Companies promote it for their employees. Parents demand it for their children. Those who have it believe they have a competitive edge. Those who don't have it seek it out. "It" is computer literacy. Interestingly, in both business and academe, a fundamental question is often unanswered: What is computer literacy?

Is it social issues, technical concepts, programming, application skills and/or hands-on exposure? If so, what is the proper mix? I define computer literacy in terms of what an individual will have achieved upon attaining computer literacy (vs. identifying topics of study). The computer literate person will:

- Be comfortable in the use and operation of a computer system.
- Be able to make the computer work for him through judicious generation or use of software.
- Be able to generate input to the computer and interpret output from the computer.
- Be able to understand how computers are impacting society, now and in the future.
- Be an intelligent consumer of computer-related products and services.

I would welcome feedback on this concept of computer literacy.

Long, president of Long and Associates, is a consultant, lecturer and author in the field of information services. If you have a question you'd like him to address, send it to Larry Long, Editorial Department, Computerworld, *P.O. Box 880, Framingham, Mass. 01701.*

Videoconference to be broadcast via satellite

PISCATAWAY, N.J. — A videoconference titled "Integrated Manufacturing Systems" will be aired via satellite across the U.S. Dec. 4 by the Institute of Electrical and Electronics Engineers (IEEE).

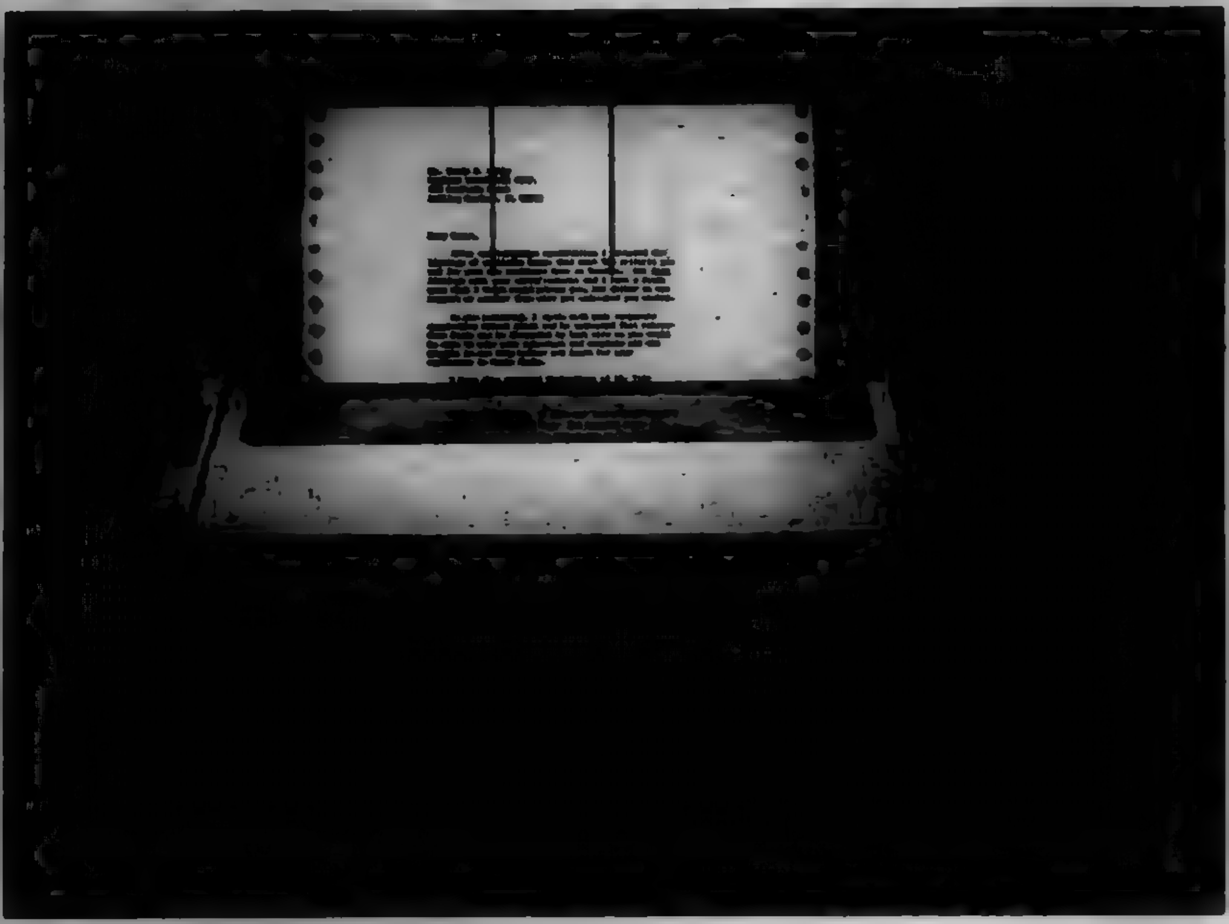
The videoconference will cover manufacturing product design; production systems design; manufacturing lines installation and operation; manufacturing management; and industrial systems education, said a spokesman for the IEEE.

The technical consultant for the conference is John Luber, of the Manufacturing Technology Institute, an internal corporate-level school of IBM.

Others appearing at the session will be William Beeby, a lecturer on manufacturing systems; Edward Holden III, director of advanced engineering for manufacturing at IBM; Samuel B. Korin, director, IBM Manufacturing Technology Institute; and Donald L. Sage, department chief, engineering and computer systems development, Richmond works, AT&T Technologies.

The videoconference will be aired to universities, companies and IEEE-sponsored locations.

The fee schedule and information for establishing a site may be obtained from the IEEE Continuing Education Department, IEEE Service Center, 445 Hoes Lane, Piscataway, N.J. 08854.



The TI 855 microprinter.
No other printer says better so many ways.

Feature for feature, no other microprinter can match the versatility, compatibility, reliability and productivity of the OMNI 800* Model 855 microprinter. Here's why.

Two Printers In One. With the TI 855 you get the speed of dot matrix draft copy. Plus the precise clarity of the most advanced matrix technology for letter-quality print. It's two printers in one — at one low price.

A Great Family Name. Texas Instruments is known for providing the world with the industry standard for printers — the TI 810. TI builds the same reliability into every 800 series microprinter. Both the 855 and the data processing Model 850 are part of the expanding TI line of high-performance, low-cost microprinters.

Hardware Compatible. The TI 855 microprinter is compatible with all major PC hardware. And it provides both serial RS232C subset and "Centronics-type" parallel as standard interfaces.

Software Compatible. The TI 855 uses industry standard escape sequences for compatibility with virtually all third-party software. And for those with proprietary software needs, a model is available with ANSI standard escape sequences.

Tough Font Modules For Quick Character Change. Three font modules can be inserted into the front of the printer at one time, and are accessed individually. Each contains both draft- and letter-quality character sets. They're easier to use, more reliable and more durable than traditional metal or plastic daisy wheels.

More Productivity Than Any Other Microprinter. The 855 offers both friction and tractor paper feed, to handle all types of word and data processing applications. A quick-change snap-in cartridge ribbon. Raster and mosaic graphics. And intelligent printing which maximizes document throughput — regardless of format.

Get the printer that makes for better information systems. For more information visit your nearest TI authorized dealer or write Texas Instruments Incorporated, P.O. Box 809063, Dept. DPF-00000, Dallas, TX 75380-9063. Or call toll-free: 1-800-527-3500.

Most People Who Try NOMAD2 Buy It!

All 4-GL/DBMSs make the same claims as to features and attributes, but you have to look closer to see the difference between NOMAD2 and all the others. It's not only *what* NOMAD2 does. It's *how* it does it. And it's the *how* that leaves the programmer productivity issue in the dust.

As the saying goes, talk is cheap. So rather than just telling you about NOMAD2, we'd rather prove it to you through an application building demonstration, or a trial installation. Further, we invite you to compare NOMAD2 to the products of our leading competitors. And we wouldn't make that suggestion if we weren't fairly certain of the outcome of such a comparison.

Among current NOMAD2 users are some of the largest corporations in America including banking institutions, motion picture companies, supermarket chains, oil companies, pharmaceutical firms, insurance companies and major newspapers, to name just a few. And in most cases, NOMAD2 was chosen after head-to-head testing against the leading competitive products.

The products and services of D&B Computing Services have evolved over the years to keep pace with the rapidly changing business environment. And evolution is an essential part of our ongoing commitment to providing quality business tools to help you get more leverage from the way you do business. NOMAD, now NOMAD2, is a product which can help keep you on the right track.

Most people who try NOMAD2 buy it. You owe it to yourself to find out why.

NOMAD2: An Innovation In End-User Computing From Dun & Bradstreet

Micro system keeps court cases at reporters' fingertips

WASHINGTON, D.C. — When the Reporter's Committee on Freedom of the Press, founded 12 years ago here, began to seek information through freedom of information statutes in the 1970s, the committee found it needed a fast, cost-effective method of tracking cases.

Under the direction of Newhouse Newspapers veteran reporter Jack Landau, the committee late last year acquired a microcomputer system that could trace court docket numbers, monitor the status of individuals involved in litigation or controversial journalism around the country and be learned with relative ease.

The system is the 32:16 from Fortune Systems Corp. of Redwood City, Calif. The committee first installed a 32:16 with 768K bytes of main memory and a 30M-byte hard disk, running AT&T's Unix operating system. After reviewing what its needs will be this winter, the committee acquired 1M byte of main memory.

The committee operates four terminals in-house and one at Landau's home. None of the users working with the system are trained in DP; two are lawyer/journalists and a third is a retired newspaper editor. All are picking up expertise in computers along the way, according to Robert Becker, a staff attorney with the committee.

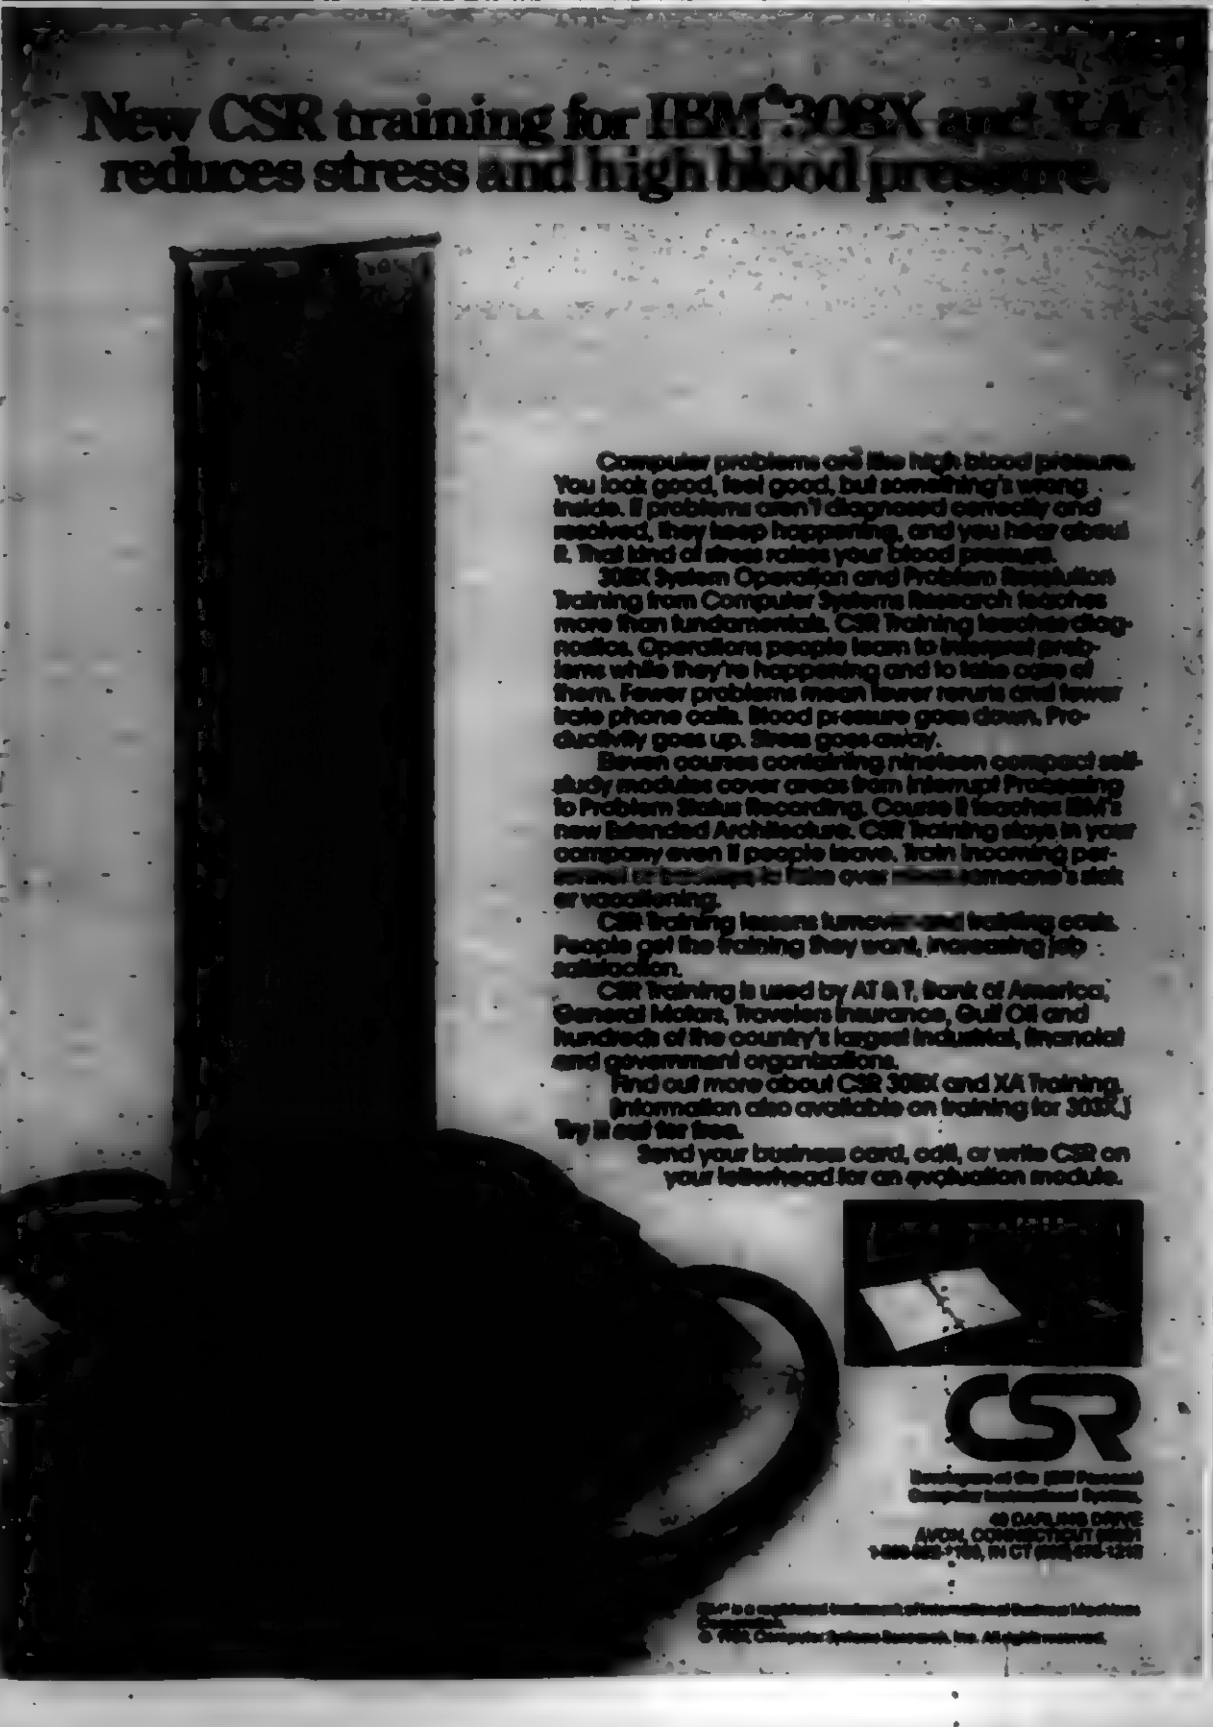
"This is the perfect network system for a small organization like ours, which needs access to a word processing system, a data base and a spreadsheet," Landau said. "We find it extremely easy to use, and we've been able to show law and journalism interns how to use it in a minimal amount of time."

Initially, the committee required a strong word processing program. One of the major functions of any organization that operates on a nonprofit basis, Landau said, is fund-raising and communications, and Fortune:Word — Fortune's proprietary word processing system — fit that requirement.

But shortly after the system's installation, Landau and his staff decided that a strong data base for tracking cases, along with a spreadsheet to permit more in-house budget estimating and data exchange, would improve productivity. "We've set up a single information inventory system using [Microsoft Corp.'s] Multiplan;" he said. "We can easily make entries using Multiplan's textual capabilities, then switch to Fortune:Word. It seems we've pushed the system pretty hard, beyond its usual functions, and it has responded well."

At present, the Reporter's Committee staff is tracking more than 800 cases around the country — most of them still pending. The staff is working on entering cases into the data base, however. "We are nowhere near getting 12 years of files into the system yet," Becker said. From the cases on file and in the data base, the staff responds to several thousand telephone calls each year from journalists and attorneys seeking information.

The range of functions that office automation has made available to the committee continues to increase, according to Landau. The Reporter's Committee now is preparing data bases of potential contributors and is processing mailings through Fortune:Word to individuals who support the committee activity. In addition, a series of legal dissertations and education programs for journalists around the country is being prepared with the help of the system.



New CSR training for IBM® 308X and XA reduces stress and high blood pressure.

Computer problems are like high blood pressure. You look good, feel good, but something's wrong inside. If problems aren't diagnosed correctly and resolved, they keep happening, and you hear about it. That kind of stress raises your blood pressure.

308X System Operation and Problem Resolution Training from Computer Systems Research teaches more than fundamentals. CSR Training teaches diagnostics. Operations people learn to interpret problems while they're happening and to take care of them. Fewer problems mean fewer reruns and fewer irate phone calls. Blood pressure goes down. Productivity goes up. Stress goes away.

Eleven courses containing nineteen compact self-study modules cover areas from Interrupt Processing to Problem Status Recording. Course II teaches IBM's new Extended Architecture. CSR Training stays in your company even if people leave. Train incoming personnel or backups to take over when someone's sick or vacationing.

CSR Training lessens turnover and training costs. People get the training they want, increasing job satisfaction.

CSR Training is used by AT & T, Bank of America, General Motors, Travelers Insurance, Gulf Oil and hundreds of the country's largest industrial, financial and government organizations.

Find out more about CSR 308X and XA Training. (Information also available on training for 303X.) Try it out for free.

Send your business card, call, or write CSR on your letterhead for an evaluation module.

Computer meet to feature law, communications

PHOENIX — Judge Harold H. Greene, who presided over the landmark divestiture of AT&T, will deliver the keynote address at the Third Annual Advanced Computer Law Invitational to be held at the Pointe Resort at Squaw Peak here Jan. 14-16.

According to the sponsors, the Arizona Law and Technology Institute and the Arizona State University College of Law, the event will be a conference and workshop on the emerging legal issues resulting from the convergence of the computer and communications industries and recent regulatory changes relating to telecommunications. The conference faculty is scheduled to include more than 30 national and international experts who will provide an advanced briefing for industry executives.

Scheduled speakers include J. David Hann, president of GTE Telenet Communications Corp.; Howard Aibel, senior vice-president and general counsel of ITT; Howard Trienens, vice-president and general counsel of AT&T; Hugh Barrett, senior vice-president of First City Bancorp.; and Kenneth Cox, senior vice-president of MCI Communications Corp.

The cost for the Invitational is $545.

Information is available from the Arizona Law and Technology Institute, c/o Arizona State University College of Law, Tempe, Ariz. 85287.

Rhapsody in blue.

In today's office automation environment, Wang realizes that simply making better products is no longer enough.

Because in today's office automation environment, the products of one company must often work in harmony with the products of another.

And that's why Wang's entire line of computers are not only compatible with each other, but work just as easily with most IBM products.

Wang. Maybe we're more competitive simply because we're more compatible.

WANG

We put people in front of computers.

COM generator eases microfiche duplication woes

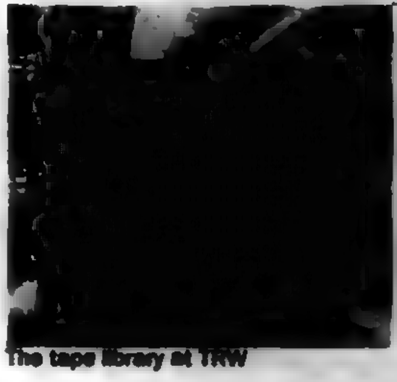
REDONDO BEACH, Calif. — When TRW, Inc. reorganized in 1981, company management emphasized the need to reduce data processing costs. As a result, the computer operations department of the company's Operations and Support Group closely examined its computer-output microfiche (COM) operation.

The company estimated the cost of an impact-printed original page at 12.5 cents; a high-speed laser-printed page at 3.5 cents; and a microfiche of 270 pages at $1.37, or 0.05 cents a page. Each duplicate microfiche cost 17 cents, according to Emanuel Valdez, manager of computer operations.

Valdez's department is responsible for all business data processing for five operating groups of TRW's Electronic & Defense sector here. The business processing needs include accounts payable, accounts receivable, inventory control, manufacturing systems and management reporting.

8.2 million pages a month

The department's DP equipment includes two IBM 3081 mainframes, an IBM 3033 mainframe, an IBM Series/1 minicomputer, four high-speed laser paper printers and two impact paper printers. The department produces some 8.2 million pages of output each month.



The tape library at TRW

"We realized that many departments wanted to use COM because of the potential cost and space savings, but they were not satisfied with the quality we were producing," said Dan Williams, a computer operations shift supervisor. "So we evaluated dry COM units that were reliable enough to go on-line, and the [Eastman Kodak Co.] Komstar 200 microimage processor was the best on the market. An on-line system substantially increases productivity."

"We had a lot of resistance when we were using the earlier, wet COM equipment, and with good reason," Valdez said. "We could not service the users as quickly as needed because the COM hardware was unreliable. Even if we did turn the work around fast enough, we frequently had to redo jobs because quality was inconsistent."

No operator intervention required

One advantage to the Komstar 200 unit, Valdez noted, is that it is an on-line device that requires no operator intervention. TRW's computer system sees it as just another high-speed printer.

The Komstar unit, like the other printers, functions as a computer peripheral, but prints on film rather than paper. The device has its own front-end minicomputer, so it functions on-line without requiring special programming by the host computer. Microfiche are exposed, cut and processed in an automatic, straight-line operation.

Users who need many duplicates realize the greatest savings. The payroll department probably benefits the most because it needs many precise duplicates, Williams said. Duplicates are produced by a Kodak Ektafiche duplicator, which can generate single or multiple microfiche copies from an original at a maximum rate of 1,000 copies per hour.

"We have reports that required 50 magnetic tapes, which an operator had to load onto the off-line, wet COM units," Williams said. "The process was not only time-consuming and labor-intensive, but it also created problems with tape drives and operator error."

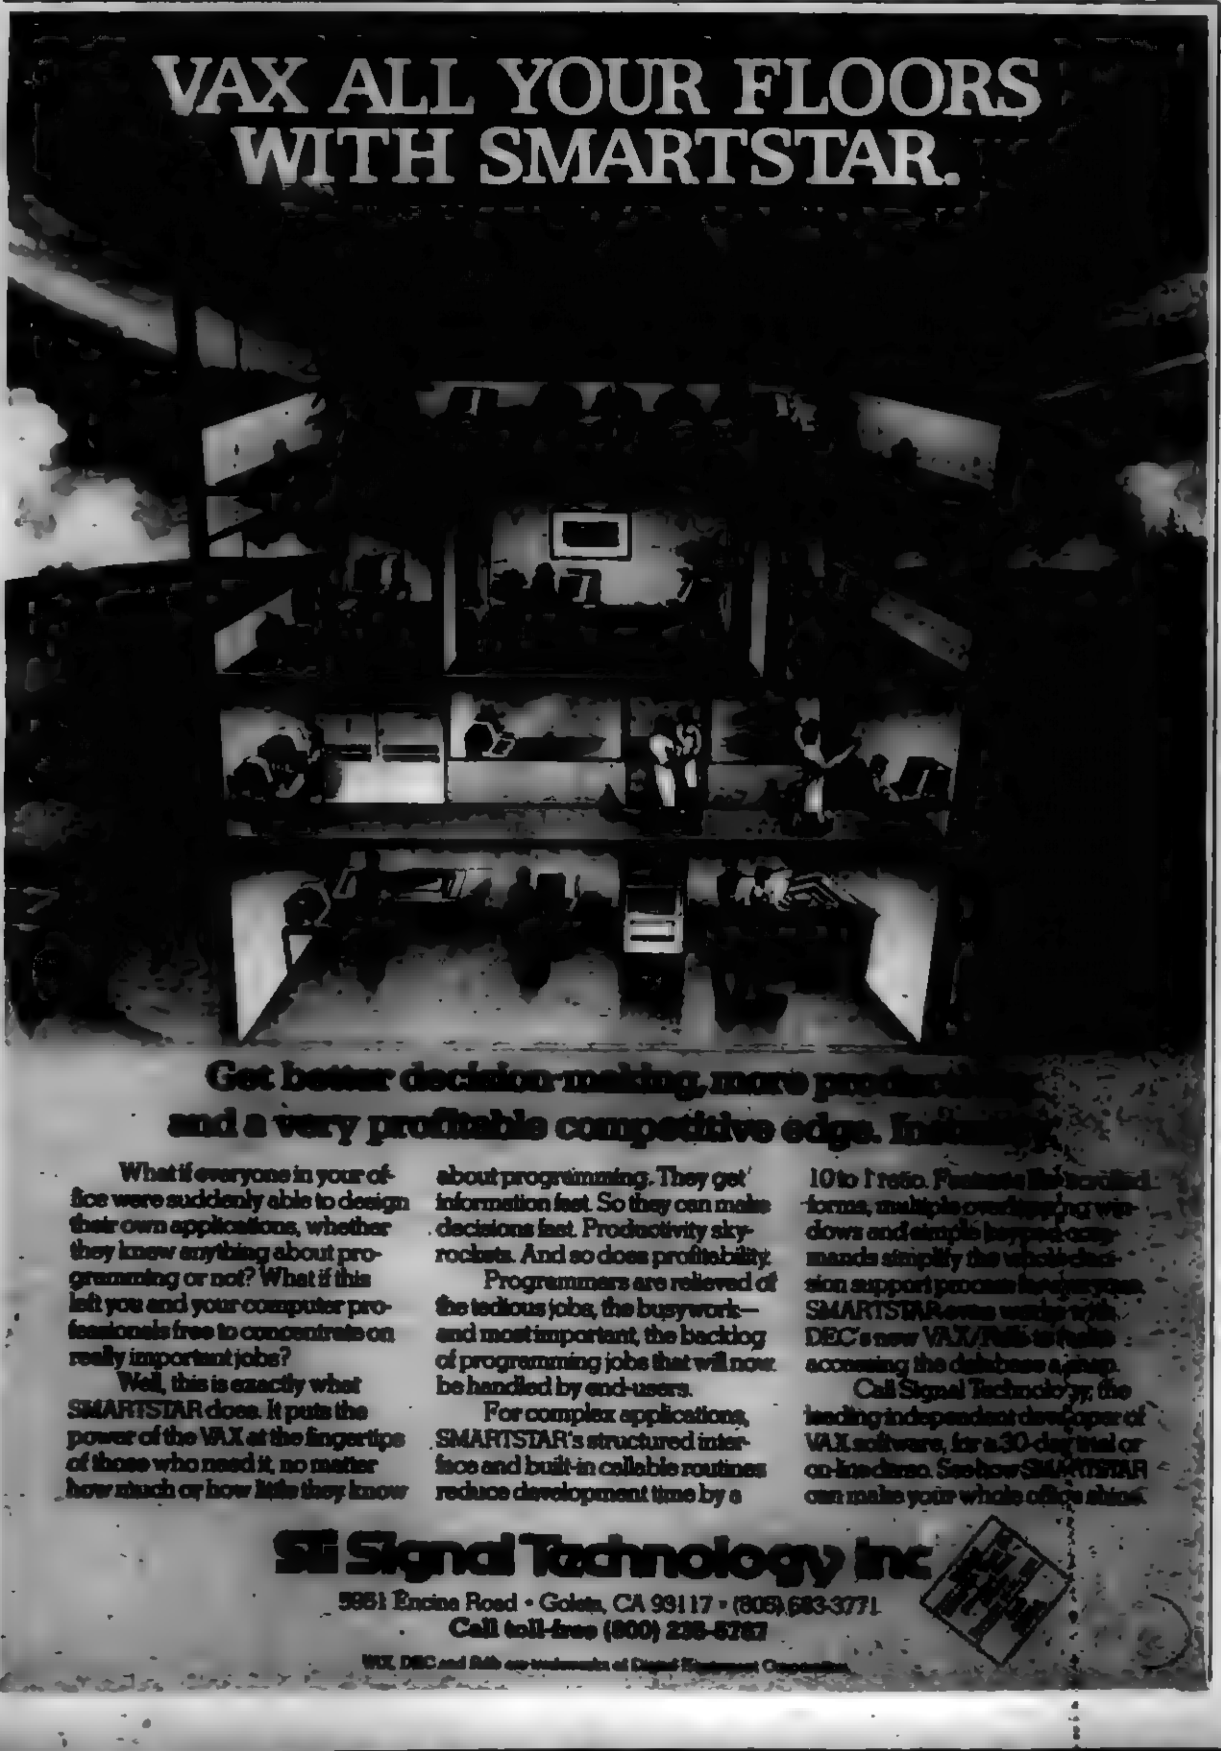
Direct transmission

Now, data can be transmitted directly to the on-line Komstar unit from the mainframe computer, eliminating operator intervention. Operators remove the finished, stacked microfiche from the receiving tray and load film.

The department presently generates more than 3 million frames a month on the Komstar processor and about 80,000 duplicate microfiche on the Ektafiche duplicator.

The computer operations department's COM volume has increased 500% since installation of the dry processing units, bringing the total COM volume to 40% of the department's total output, according to Valdez. The Komstar unit produces almost half the volume run on the four laser paper printers, he added.

The conversion to dry processing took three days. The department had some quality problems in the beginning because no quality control system was employed by the 40 operators who used the equipment. Valdez enlisted Kodak's aid in establishing a quality procedure. Now, a control microfiche is run at the beginning of each of three shifts. He said the equipment is also reliable — it was available 99.8% of the time in an 18-month period.



VAX ALL YOUR FLOORS WITH SMARTSTAR.

Get better decision-making, more productivity and a very profitable competitive edge. Instantly.

What if everyone in your office were suddenly able to design their own applications, whether they knew anything about programming or not? What if this left you and your computer professionals free to concentrate on really important jobs?

Well, this is exactly what SMARTSTAR does. It puts the power of the VAX at the fingertips of those who need it, no matter how much or how little they know about programming. They get information fast. So they can make decisions fast. Productivity skyrockets. And so does profitability.

Programmers are relieved of the tedious jobs, the busywork—and most important, the backlog of programming jobs that will now be handled by end-users.

For complex applications, SMARTSTAR's structured interface and built-in callable routines reduce development time by a 10 to 1 ratio. Features like scrolled forms, multiple overlapping windows and simple keypad commands simplify the whole decision support process for everyone. SMARTSTAR even works with DEC's new VAX/Rdb to make accessing the database a snap.

Call Signal Technology, the leading independent developer of VAX software, for a 30-day trial or on-line demo. See how SMARTSTAR can make your whole office shine.

Government official to address telecommunications gathering

HONOLULU — David Markey, U.S. assistant secretary of Commerce for Communications and Informations, will be among the speakers at the seventh Pacific Telecommunications Conference (PTC), Jan. 13-15 in Honolulu.

The conference will be held at the Sheraton-Waikiki hotel and will address how digital technology affects the development of telecommunications services in the Pacific. Other scheduled speakers at the conference include Martin Fournier of Teleglobe Canada and Michio Nagai of United Nations University.

On Jan. 15, J.C. Delorme, president and chief executive officer of Teleglobe Canada, will discuss "Education in a Digital World." Also on Jan. 15, groups will meet to discuss problems and issues in teleconferencing, transborder data flow and training.

Richard Colino, director general and chief executive officer of the International Telecommunications Satellite Organization, will discuss international satellite service.

Registration for the conference is $360 for members of the Pacific Telecommunications Council and $395 for nonmembers. PTC is at Suite 308, 1110 University Ave., Honolulu, Hawaii, 96826.

Computer conference to cover applications in CIM technology

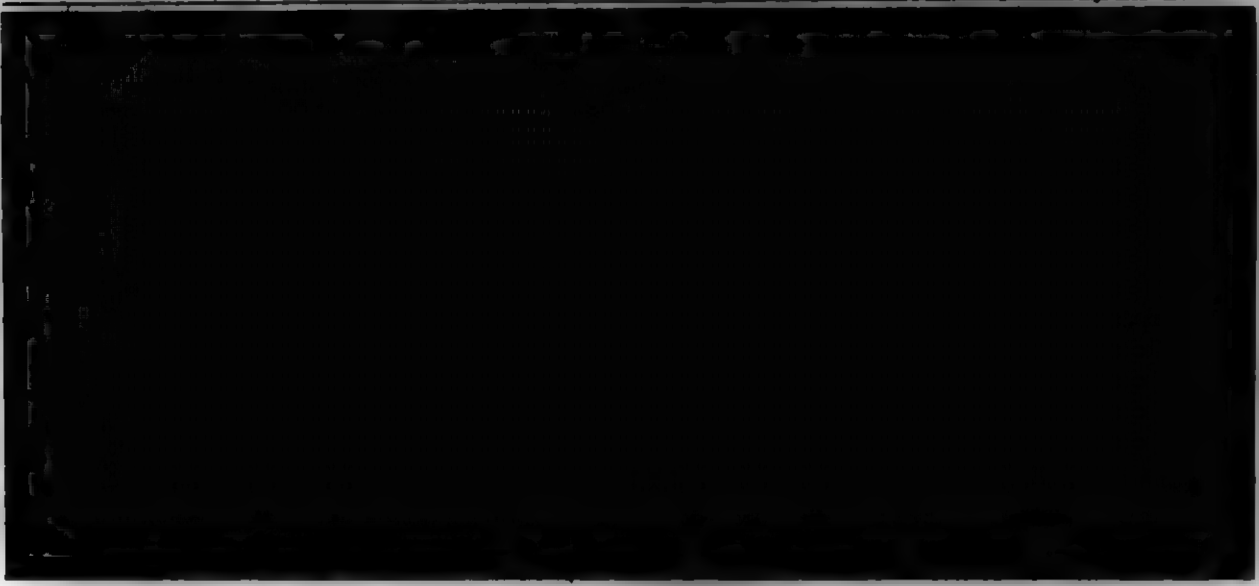
BURLINGAME, Calif. — George Meister, vice-president and general manager of McDonnell Douglas Automation Co.'s computer-integrated technology division, will present the keynote address at the Computers in Manufacturing conference Nov. 28-30.

The Computers in Manufacturing conference will focus on the application of new hardware and software and on communication and management techniques in Computer-Integrated Manufacturing (CIM), according to its sponsors, the National Institute for Management Research. The conference will also examine the integration of the data processing department in CIM and the uses of production control and materials handling.

All attendees will reportedly receive a 1,000-page reference notebook on CIM.

The conference will be held at the Hyatt Burlingame Hotel here. Registration is priced at $595 per person. Group registration is $295 per person.

Additional information on the conference is available from the National Institute for Management Research, P.O. Box 3727, Santa Monica, Calif. 90403.



MORE THAN 800 LARGE NETWORK USERS DON'T HAVE TO FIT NCR COMTEN.

NCR COMTEN FITS THEM.

There are two basic choices in developing a data communications network: you can compromise your objectives to fit the limitations of the system; or you can choose a system with a flexibility to accommodate your needs.

NCR Comten gives you the latter option. Our Communications Network Architecture lets you accommodate yesterday's and today's technologies in your present network and anticipates future and emerging technologies without major equipment change.

Fitting our system to your needs is just part of the NCR Comten story. You'll find more good reasons in our special executive briefing. For details, write "Data Communications Systems", NCR Comten, Inc., Department 8015, 2700 Snelling Ave. N., St. Paul, MN 55113. Or call 1-800-334-2227. In Canada, call 1-800-543-5713.

LEARN MORE ABOUT THE COMPANIES NCR COMTEN KEEPS.

☐ Find out how a southeastern bank got the networking technology it needed by efficiently combining an old network and a new network. And preserved a $9 million investment in the process.

☐ Discover how a national industrial firm — famous for productivity innovations — processes $4 billion worth of orders a year without a hitch by using advanced data communications solutions to tie together all of its data centers.

☐ Learn how a major data services company not only serves customers better, but also supports a 20 percent per year growth rate by using its network flexibility as part of its *marketing* plan.

System licks candy maker's inventory control problems

OAKLAND, Calif. — Rapid growth of a candy maker here made inventory control and product tracking a time-consuming task.

According to Controller Glenn Casebolt of Herman Goelitz Candy Co., two years ago the company computerized its product inventory system in order to provide greater control over the company's candy manufacturing processes. Goelitz Candy makes Jelly Belly jelly beans, candy corn, Jordan almonds and bridge mixes.

When Casebolt joined Goelitz Candy, he knew just what he wanted in a computer system, having seen several companies go through the conversion process.

"Basically, I did not want to hire our own programmers," Casebolt said. "I wanted a package that was specially geared to the food industry."

Shopping around

A six-month selection process had Casebolt looking at quite a variety of products, including minicomputers from both IBM and Wang Laboratories, Inc.

A software package that was geared specifically to the food industry was of particular importance in his selection, according to Casebolt. "I bought the software first and then bought the hardware to go along with it," he said.

In May, Goelitz Candy completed installation of a Management Associates, Inc., MAI 8010 hardware/software package.

The company's system encompasses both its Oakland, Calif., and Chicago offices. It includes a 1M-byte memory, a 144M-byte disk drive, a magnetic tape streaming drive, 10 VDTs (four for each office), five printers and three IBM Personal Computer interfaces.

Casebolt now uses a Personal Computer, but, according to the controller, the company is planning to expand its number of Personal Computers in the future.

According to Casebolt, before the installation of the computer system, the company used a service bureau to process its product orders, sales analyses and accounts receivable. All invoices, bills, sales analysis recaps and accounts receivable recaps would be back at the candy company in about 48 hours, Casebolt said.

Instant updates

With the new system, Casebolt said, members of the order department receive instant information updates on any sales, billings and accounts receivables.

"We can, in a much easier fashion, keep tabs on dated [candy] products — when they were produced and when they went to market," according to Casebolt, "Plus, the more efficient operation of our offices" means less overhead, and as a result, "candy prices probably won't be rising as rapidly as they might without the system."

"The system provides for almost every type of transaction, including marketing, manufacturing, cost and inventory controls" of finished goods, he said.

Attention IBM Users

"Paradyne
Makes Your
Remote Devices
Behave...
[illegible] Locals."

Plug Them Into
Paradyne's PIXNET.

With PIXNET, terminals and high-speed peripherals can be placed in any location. In another building or another town.

They'll be gone but not forgotten. Because they'll still behave like local devices, under the control of your same CPU over your same communication lines.

The "Speedier Factor."

With Paradyne's PIXNET, remote = local. The host CPU will think your remotes are right in the same room. So remote devices can be run from their own locations.

Access any program or application, in any computer on the network, from the remote location.

Low-Cost Network Expansion.

Widen your data operation with this cost-effective networking innovation.

Move a device, a CPU, or a department over the weekend and be up and running Monday morning.

With no extra front-end processors. No extra software, for host or application. No extra burden on the host.

Improved Remote Performance.

Run high-volume IBM 3890 check processors from your home office mainframe. With PIXNET you can process 100,000 documents an hour at your remote site with no additional CPU power.

Print up to 60 pages a minute remotely with Paradyne's Remote High Speed Page Printer. Paradyne's PIXNET also improves the performance of remote high speed printers and IBM 3270s.

Call today and find out how we can put your remote devices on their best behavior:

Large Data Center
Limited-Distance
Multiplexing
see pg. 101

Fibronics

Come to Sperry for three compact, state-of-the-art systems designed to fit every business or corporate department. Systems that truly boost productivity and bolster corporate strength.

The MAPPER System

Using plain-English instructions, it allows *non*-computer people to develop custom applications. And companies don't encounter the frustrations and delays of getting programmers to understand specific business and information needs.

SPERRYLINK Office System

The one office automation system that can do just about everything. Electronic Mail. Electronic filing and retrieval. Word Processing. Personal Computing. Voice storage and playback. Telecommunications. Access to outside databases and the real power of the main computer.

THE SPERRY PC

Built to accept all enhancements and software created for the IBM PC but it's no mere clone. It's what the personal computer should have been in the first place. Look at the graphics: more dramatic. Feel the keyboard: more comfortable. Consider the ability to plug into the main computer: whether that system is from Sperry, IBM or both.

The MAPPER System, SPERRYLINK Office System and the SPERRY PC. The three systems that make the power of the computer more accessible and useful than ever before. For more information or a demonstration at the Sperry Productivity Center nearest you, call toll-free 800-547-8362. Or write: Sperry Corporation, Box 500, Blue Bell, PA 19424-0024.

BOOK REVIEWS

DATA ADMINISTRATION
By William Durell

The author makes the case for the data administrator as the person to "plan, document, manage and control the information resources of an entire organization." Analysts and programmers typically manage the data for the systems and programs directly under their control. The data administrator takes the larger corporate view and uses data dictionaries and data bases as his tools of control.

Durell argues for data dictionaries, describing them in much more glowing terms than their current usage in DP departments would seem appropriate. Data dictionaries are just one area where the worlds of the data administrator and the data processor diverge in practice and theory. Data processors tend to dislike rigid data definitions forced on them; they think in terms of systems, not data; they resist the use of data formatted and defined by someone else.

Data administrators are advised to seek out the authority from management to prescribe data standards on the independent-minded DP workers. Of course, the active cooperation of those in DP or end-user departments would further the data administrator's goal. There are two questions: Can he get this cooperation? And does he deserve it?

Hardcover, 303 pages, $32.95, ISBN 0-07-018391-0. McGraw-Hill Book Co., 1221 Avenue of the Americas, New York, N.Y. 10020.

HOW TO WRITE PAPERS AND REPORTS ABOUT COMPUTER TECHNOLOGY
By Charles Sides

If you did not foresee writing as much as you do on the job, then you probably are not prepared to do it well. Writing proposals, specifications and documentation may be the most unexpected and irritating part of a computer professional's work. Writing may also be the most important, according to the author.

The first lesson is a maxim for all writers: Write to your audience. That means judging what level of detail and jargon your readers can take. Writing over or under the heads of readers will lose their attention quickly.

Next, analyze the document's purpose. Here you determine the problem, the technical issues and exactly what the paper will do for the reader.

A working structure is necessary — what the author calls a Visual Organization System, which is known to everyone else as an outline. Getting organized leads to getting information and then to explaining the subject. This section is the book's best. Six types of definition techniques are discussed: formal/informal, metaphorical, stipulative, contextual, operational and divisional. The words sound pedantic, but the book clearly shows how each specifies a type of sentence commonly found in documentation.

A divisional definition, for instance, is reflected in this sentence: "[Digital Equipment Corp.'s] Decmate is a stand-alone personal computer which is comprised of a [CPU], a video display screen and a keyboard terminal." The writer must understand that when a reader sees a divisional definition, he expects to read next about each part mentioned in order.

There is a good deal more in this slim book, with much of it presenting good writing techniques. Some of the discussion is linked to the specific problems of communication in the computer industry. More would have been better.

Paperback, 148 pages, $14.95, ISBN 0-89495-036-3. ISI Press, 3501 Market St., Philadelphia, Pa. 19104.

ART AND THE COMPUTER
By Melvin Prueitt

If you are, by chance, in the midst of the practical problem of coaxing business graphics from computer to slide or paper, take a moment to rest your eyes on an arresting gallery of images. No graphic will seem too difficult to produce after leafing through these 300 striking examples of what the computer can do, given time, software and an artist in control.

Note particularly Picture 147, "Foggy Chessmen," where the pieces are reflected in the board and softened in fog; Picture 168, "Down the Drain," a sphere falling into a gray and purple-striped vortex; and Picture 282, "Sunflowers Watching the Sun," where each flower is angled slightly differently toward the light.

A short, preliminary section discusses animation and computer-aided design. Next to each color picture, a caption tells who created the image and where. Sometimes the author tells how the picture was made. More such explanations and in greater detail would have added to the appreciation of the art and the difficulty of its creation.

Paperback, 246 pages, $29.95 (hardcover, $39.95), ISBN 0-07-050899-2. McGraw-Hill Book Co., 1221 Avenue of the Americas, New York, N.Y. 10020.

Insurer upgrades sales system with training, printer

SPRINGFIELD, Mass. — When a large insurance company here decided to upgrade the sales support system in its agency offices across the country, 13 manufacturers were in the running to become the dot matrix printer supplier.

Massachusetts Mutual Life Insurance Co. developed Respond III-PC, which consists of the IBM Personal Computer 3270 running under IBM's DOS 2.0, printers, in-house-developed sales applications software, Multimate International, Inc.'s Multimate word processing and Lotus Development Corp.'s 1-2-3, according to Richard Coburn, second vice-president of Mass. Mutual. The system was designed to bring the home office's Amdahl Corp. mainframe computer capabilities into the widely scattered agency offices, he said.

The company reasoned that by capitalizing on the computer's ability to produce sales illustrations, complicated spreadsheets, annual review letters and other kinds of routine correspondence quickly, the Mass. Mutual agent can spend more time providing service to current policyholders and seeking new ones, Coburn said.

In February 1983, the company announced its push to put Respond III-PC in place, Coburn said. It organized two- and three-day training programs for its clerical staff and agents in the use of the system's word processing package and in the 1-2-3 package, he said.

Most of the software was written in-house with a high priority on user friendliness, Coburn said. Programs use prompting, menus, error messages, validity checking and come with reference manuals so users can train themselves, he added.

The company had thoroughly researched sources of hardware and software by evaluating selected materials for at least 30 days in-house, Coburn said. It also arranged for quantity purchases at high-discount prices by dealing directly with vendors and committing to high volumes to take advantage of quantity price breaks, he said.

Thirteen dot matrix printers were reviewed prior to selection, Coburn said. Nine of those were put through an extensive evaluation for more than a month, he added, while the remaining four were given cursory examinations.

The company's technical staff did hands-on evaluations to determine features such as speed, reliability, noise level and clarity of characters, he said. They also contacted other users as reference checks and investigated the reputation and size of the vendors. One guideline was to stay away from small manufacturers to avoid buying machines that would not have support in the future if the small business failed, he said.

Rugged system

Mass. Mutual decided on the 3024 model, manufactured in Waynesboro, Va., by Genicom Corp., Coburn said, because it was "rugged enough to take high-volume, eight-hour-a-day usage." Mass. Mutual performs its own maintenance, so a primary consideration was reliability, he said. "There are less expensive dot matrix printers on the market, but nothing comparable on a price/performance basis," he added.

Other features important to the company included its speed (200 char./sec draft and 40 char./sec near-letter-quality), its quietness, the readability of the near-letter-quality print style, the long ribbon life and its ease of operation, Coburn said.

The company uses the printers with about half of its 500 installed systems, Coburn said. Mass. Mutual originally purchased Genicom's Model 3184 printers, the only suitable type available at the time, he said. It switched to the Model 3024 when it came out at $300 less than the 3184, he said, because it did not need the Model 3184's ability to upgrade to other things, such as color printing.

REVIEWS

Elsevier Science Publishing Co., 52 Vanderbilt Ave., New York, N.Y. 10017.

MICROCOMPUTER SOFTWARE BUYER'S GUIDE reviews the top-selling word processing, spreadsheet, data base management and integrated software packages. The guide also includes benchmark comparisons of these packages; by Tony Webster and Richard Champion (with the cooperation of Datapro Research Corp.). Paperback, 422 pages, $19.95, ISBN 0-07-068967-9. McGraw-Hill Book Co., Professional and General Books, 1221 Avenue of the Americas, New York, N.Y. 10020.

UNIX FOR PEOPLE provides practical guidance as well as theory for the experiential learning of the operating system; by Peter Birns, Patrick Brown and John Muster. Hardcover, 528 pages, $29.95, ISBN 0-13-937459-0. Prentice-Hall, Inc., Englewood Cliffs, N.J. 07632.

Publishers wishing to have their books considered for review can direct books, prepublication galleys, press releases, catalogs or other information to George Harrar, Book Review Editor, Computerworld, P.O. Box 880, 375 Cochituate Road, Framingham, Mass. 01701.

Until now, when you operated the PC in the terminal emulation mode, keys had to be redefined. For inexperienced users, that could be both awkward and time-consuming.

What's more, it's always required quite a few keystrokes to engage a PC-to-mainframe function such as file transferring.

The result again was an increase in the chance for human error.

As well as an increase in the amount of time and money spent on a job.

Now IRMA's addressed both those problems with a keyboard that costs only $329, suggested retail.

Introducing the IRMAkey/3270. IRMAkey contains all the 3270 keys for terminal emulation. And all the PC keys when you're in the computer processing mode.

Moreover, IRMAkey contains four additional keys that allow the PC user to get IRMA up and running immediately as well as engage any DCA software system the user wants.

All in one simple stroke.

IRMAkey/3270. Only from DCA. It's a touch faster than a terminal. Or a PC. Or both.

For more information, send in the coupon to DCA. Faster still, call us at 1-800-241-IRMA. Telex 261375 DCAATL.

Mail to DCA, 303 Technology Park, Norcross, GA 30092. And we'll tell you more about all IRMA products.

CALENDAR

WEEK OF NOVEMBER 18

NOVEMBER 19, NEW YORK — **Sysed Training Forum.** Contact: Sysed, Inc., 35 W. 35th St., New York, N.Y. 10001.

NOVEMBER 19, NEW YORK — **Introduction to the IBM Personal Computer.** Contact: Center for Advanced Data Processing, Suite 402, 450 Seventh Ave., New York, N.Y. 10123. Also being held Nov. 26 in New York.

NOVEMBER 19, NEW YORK — **Spreadsheets Using Lotus 1-2-3.** Contact: Center for Advanced Data Processing, Suite 402, 450 Seventh Ave., New York, N.Y. 10123.

NOVEMBER 19-20, MINNEAPOLIS — **Operating Systems for Personal Computers.** Contact: The American Institute for Professional Education, Carnegie Building, 100 Kings Road, Madison, N.J. 07940.

NOVEMBER 19-20, BOSTON — **Discovering Lotus 1-2-3.** Contact: Data-Tech Institute, P.O. Box 569, 386 Franklin Ave., Nutley, N.J. 07110.

NOVEMBER 19-21, PALO ALTO, CALIF. — **Structured Techniques Using Fourth-Generation Languages.** Contact: Software Institute of America, 8 Windsor St., Andover, Mass. 01810. Also being held Dec. 18-20 in Dallas.

NOVEMBER 19-21, BOSTON — **Project Management & Control.** Contact: QED Information Sciences, Inc., P.O. Box 181, 170 Linden St., Wellesley, Mass. 02181.

NOVEMBER 19-21, NEW DELHI — **International Conference on Computers and Technology.** Contact: J.K. Hassan, IBM, Corporate Headquarters, Armonk, N.Y. 10504.

NOVEMBER 19-22, TORONTO — **The 15th Annual Canadian Computer Show and Conference.** Contact: Canadian Information Processing Society, Fifth Floor, 243 College St., Toronto, Canada M5T 2Y1.

NOVEMBER 20, NEW YORK — **Symphony for 1-2-3 Users.** Contact: Center for Advanced Data Processing, Suite 402, 450 Seventh Ave., New York, N.Y. 10123.

NOVEMBER 20, NEW YORK — **Word Processing with Multimate.** Contact: Center for Advanced Data Processing, Suite 402, 450 Seventh Ave., New York, N.Y. 10123. Also being held Nov. 26 in New York.

NOVEMBER 20-22, AMSTERDAM — **Videotex International Conference and Exhibition.** Contact: On-line Conference Ltd., Pinner Green House, Ash Hill Drive, Pinner HA5 2AE, Middlesex, UK.

NOVEMBER 21-26, SHANGHAI — **China International Microelectronics/Computer Exhibition and Conference.** Contact: Harry C. Lepinske, American Exhibition Services International, Inc., P.O. Box 66373, O'Hare International Airport, Chicago, Ill. 60666.

NOVEMBER 21, NEW YORK — **Advanced Multimate.** Contact: Center for Advanced Data Processing, Suite 402, 450 Seventh Ave., New York, N.Y. 10123.

NOVEMBER 21, NEW YORK — **Advanced Displaywrite 2.** Contact: Center for Advanced Data Processing, Suite 402, 450 Seventh Ave., New York, N.Y. 10123.

NOVEMBER 22-30, MOSCOW — **Systemotronics '84.** Contact: Harry C. Lepinske, American Exhibition Services International, Inc., P.O. Box 66373, O'Hare International Airport, Chicago, Ill. 60666.

NOVEMBER 23-25, PACIFIC GROVE, CALIF. — **Forth Modification Laboratory.** Contact: Forth Interest Group, P.O. Box 1105, San Carlos, Calif. 94070.

WEEK OF NOVEMBER 25

NOVEMBER 26-27, INDIANAPOLIS — **Expanding Lotus 1-2-3 Applications.** Contact: The American Institute for Professional Education, Carnegie Building, 100 Kings Road, Madison, N.J. 07940.

NOVEMBER 26-28, WASHINGTON, D.C — **X.25 and Other Protocols.** Contact: Technology Transfer Institute, 741 10th St., Santa Monica, Calif. 90402.

NOVEMBER 26-28, CHICAGO — **Cellular Communications '84: The Industry Conference.** Contact: Online Conferences, Inc., Suite 1190, 2 Penn Plaza, New York, N.Y. 10121.

NOVEMBER 26-28, SAN FRANCISCO — **Computer Graphics for Business.** Contact: Technology Transfer Institute, 741 10th St., Santa Monica, Calif. 90402.

NOVEMBER 26-28, PINE MOUNTAIN, GA. — **Data Communications: Bringing You Up-To-Date.** Contact: Institute for Communications and Information Management, P.O. Box 8, Pine Mountain, Ga. 31822.

NOVEMBER 26-28, WASHINGTON, D.C — **Integrating Microcomputers into Corporate Environments.** Contact: Systems Technology Forum, 9000 Fern Park Drive, Burke, Va. 22015.

NOVEMBER 26-28, TEANECK, N.J. — **Project Management Control.** Contact: QED Information Sciences, Inc., P.O. Box 181, 170 Linden St., Wellesley, Mass. 02181.

NOVEMBER 26-29, COLUMBIA, MD. — **Data Base Machines: In-Depth.** Contact: Continuing Education Institute, 10889 Wilshire Blvd., Los Angeles, Calif. 90024.

NOVEMBER 26-29, LOS ANGELES — **Data Communications: Components, Systems and Networks.** Contact: Institute for Advanced Technology, 65 W. 55th St., New York, N.Y. 10019.

NOVEMBER 26-29, COLUMBUS, OHIO — **DOS/VSE with Explore/XP.** Contact: Betty Bruce, Education

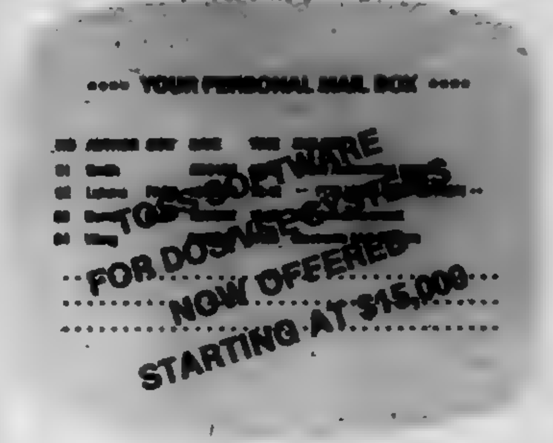
TOSS
TOTAL OFFICE SUPPORT SYSTEM

They offer PROFS under VM.
We offer TOSS under MVS, VS1, DOS/VS and DOS/VSE with CICS support.

Terminal Support
- 327 x CRTs.
- 327 x Printers.
- TTY.
- 3767
- PCs
- Display Writers.
- 8100 /DOSF.
- 6670 and System Printer.



System Features
- Short Note Facility.
- Word Processing.
- Electronic Mail.
- Calendering.
- To Do List.
- Document Filing
- User Directory
- User Friendly Interface.

Proven System Performance
Over 5000 Users Spent 15% of a Single 3081-K CPU.

STC: Beyond the smoke

As the smoke from Storage Technology Corp.'s crash into bankruptcy court begins to clear, more about the state of the company, and more important, about the state of the large-scale mass storage business, comes into sharper focus. At the same time, much broader issues involving the state of the entire computer industry rise inexorably as key market segments fade into oligopoly.

First of all, it is likely that STC will emerge from Chapter 11 in some scaled-down form — if it isn't totally absorbed in a takeover. The company still maintains a viable, IBM-compatible tape drive business and, in fact, can be criticized for not more aggressively pursuing the tape market in the past several years. IBM's dominance here is much less complete as it is (and has been) in the disk market, and while it is not a major market for IBM, the tape arena could provide a leg up for limited STC operations.

But any other operations, including Chairman Jesse I. Aweida's vision of producing complete, large-scale, IBM-compatible computer systems, must await massive infusions of capital that will be tough — if not impossible — to find.

For present users of STC equipment, this could mean looking elsewhere for both add-on machines and maintenance. According to some users contacted by *Computerworld*, STC's service component has traveled the same downward path as have the company's fortunes in the past two years.

Lurking beneath the immediate question of the fate of STC is the larger issue of IBM's dominance of the industry. Consider the disk drive business. In the last two years, IBM has shipped an estimated 90,000 3380-class disk drives at about $90,000 per unit and has, from all indications, reaped very healthy profits from these sales.

What is it about the market that forces the likes of STC into bankruptcy court while other competitors like Control Data Corp. drop out altogether, leaving Memorex Corp. as the only other U.S. manufacturer of big disk drives?

It is IBM's ultramodern disk drive plant in San Jose, Calif., built to churn out 3380s in volume at low per-unit costs, costs that can be matched perhaps only by the Japanese (like Hitachi Ltd., which supplies drives to National Advanced Systems, Inc., and Fujitsu Ltd., which supplies Amdahl Corp.). It is IBM's ability to gain a 12- to 18-month lead time on any compatible competitor, then slash its price when a competing machine goes on the market, ultimately delivering a knockout punch of an entirely new product just when the competition gets ramped up to compete against the old line. It is IBM's R&D effort, which annually pours more money into new technology than its nearest mainframe competitor realizes in total sales.

It is sheer size and brute market force.

No, there's nothing clearly underhanded or illegal about what the company does or the attendant result. But imagine a time when one company dominates every aspect of the business, for all the reasons listed above, to the point where its competitors just can't compete. Sound farfetched? Of course it is. Isn't it?

Not dead yet

LETTER

DBMS: Continuing the debate

I am professionally compelled to take issue with some of the expressions by other contributors to the Special Report, "DBMS — Not whether, but which" [CW, Sept. 24].

- Traditional application transactions and data structures frequently change — due to changes in the law and the corner offices. If they don't, where are our huge maintenance backlogs coming from?
- Suggesting that a data modeling exercise will make the appropriate general type of DBMS obvious is ill-founded. Many application data models can be equally well represented in several, if not all, of the four standard DBMS architectures (network, hierarchical, inverted-index, relational).
- You can't buy, install and use DBMS theory. Therefore, any strength/weakness contrasts must be on a product vs. product basis. Vendors have overcome the inherent theoretical weaknesses of their products with significantly varying degrees of success.
- There is nothing inherently high performance about network or hierarchical DBMS. Indeed, each has specific — and often severe — performance drawbacks.
- There are at least three IBM mainframe implemented commercial DBMS that are fundamentally hierarchical. The inherent, fundamental logical architecture of a DBMS is not determined by what a sales representative says, but by how data structures are initially defined to the DBMS.
- Programming productivity improvement with a full-feature, modern DBMS can be as high as 50:1 (for example, one hour vs. one week, with

VIEWPOINT

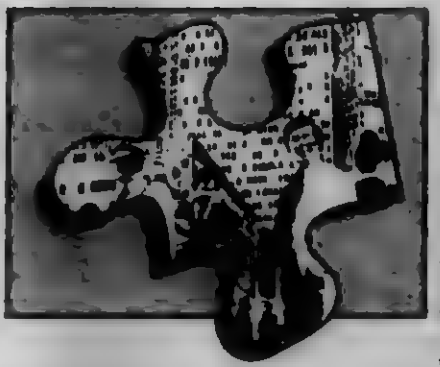
Fit to be tried

THE DATA CENTER
John P. Murray

Many of us are familiar with the phenomenon of the employee who fails in one information processing installation and who moves on to some other installation and does well, sometimes very well, in that new position. In some instances the change can be dramatic.

While every case is to some degree unique, there do appear to be two salient factors that have a strong effect on how a particular employee performs in a particular installation. These factors have to do with the environment that exists in the installation and with the chemistry between the employee, those he works with and the management of the installation. It follows then, if more time and attention are applied to consideration of these factors by both potential employers and prospective employees, some of the problems that occur relative to dissatisfaction (on both sides) and with excessive turnover, could be mitigated.

Is there a right or a wrong environment? Who can say? It depends, at least to some degree, upon the interest and the personality of the individual. It seems, however, that certain environments are more conducive to eventual success for a given individual than are others.



It could be argued, in fact it has been argued, that the use of leading-edge information processing tools and techniques, a fast pace, a rapid rate of growth and change are viewed as positive factors, and that they make a job highly desirable. As a general rule, that is a reasonable enough statement, but it cannot be universally applied.

Some people, some very skilled and competent people, are going to feel threatened by a fast-paced, leading-edge environment. The fact that these people will find themselves uncomfortable in such an environment clearly has a deleterious effect on their work and on their contribution. In such a situation, changing to a more static, less dynamic environment can often prove to be the tonic needed to bring out the employee's best effort.

Conversely, the person who sees himself as a changer, a doer, will not be comfortable, nor will he likely remain long in an installation where there is little real challenge or opportunity. So, the match between the technical environment and the individual can, and does, influence the performance of the employee.

When considering the issue of an installation's environment, the technical factor is not the only component to consider. Consideration should also be given to the pace of the installation. This has less to do with the particular technical state of the installation and more with the "feel" of the installation. Is there a sense of urgency, a pressure to get things done in a controlled manner? Does the function operate in a crisis mode, where panic appears to be the salient feature? Is there a decidedly laid-back aura to the environment? The applicant should attempt to determine the pace of the installation, and consider the appropriateness of that environment with regard to his particular temperment.

Ideally, as a part of the process to make a good match between prospective employee and employer, these environmental issues need to be presented fairly by the employer. Too often the employer tends to "sell" the job. Too often the prospective employee ignores those little warnings the mind sends out about a bad match. The eventual outcome is often disappointing for all concerned.

The chemistry between the employee and the boss, and between him and his peers, is another area that should not be ignored. Organizations develop cultures, some good, some bad, some simply bland. Over time, many of the long-term employees within the organization tend to take on various traits of that culture. One facet of the hiring process should be to describe, as fully and as candidly as possible to the employee, the cultural aspects of the organization.

The person who views himself as a creative type, a free spirit, who does best unfettered by rules and conventions, will probably not be satisfied or remain long in an organization governed by formula rules that places a great deal of restraint on the individual actions of the employees. Given such a circumstance, a very talented person may not live up to his potential. One reason for failure will have to do with expending too much time and energy chafing under the rules.

Someone else, however, just as talented, will feel very comfortable, probably even secure in such an environment. They no doubt will do very well.

Part of the interview process, for both the employer and the employee, should focus on the determination of the chemistry between the two. This cannot always be accomplished and

Microcomputer training for the administrative staff

HUMAN CONNECTION
Jack Stone

It was only a modest news squib in *The New York Times* that I read, but the announcement of a personal computer "especially designed for secretaries" clearly opens up possibilities for both a new universe of personal computer users and a major contribution to advancing the art of office automation.

The idea of supplying machines particularly oriented to secretaries — and enabling secretaries to work with spreadsheets, develop graphics displays and process data files in addition to their conventional word processing responsibilities — is a natural. Clerks, secretaries and other administrative personnel have a terrific background of information processing on which to build more advanced skills. What a wonderful way to broaden their jobs: Give them electronic tools so that they can take on more challenging and interesting work and handle it in an effective, productive manner.

In this column, I want to share some thoughts on training administrative personnel that I have gathered over the years; but first, some initial comments.

Surely, there are an awful lot of administrative personnel who have been saddled with manual processing chores that can be handled by the personal computer. Certainly word processing systems have proved their worth in the productivity arena when compared with the capabilities of electric typewriters. And we can extrapolate from there: How many millions of hours have been frittered away by administrative people in the generation of hand-drawn bar graphs and pie charts that often wind up being unsatisfactory? How much time has been wasted on the maintenance and processing of 3- by 5-in. card files or on generating budget spreads with paper and pencil — only to have to redo them time and again?

> *I was forced to address this frontline issue: how to ease the [administrative] staff into new, more complex applications — in contrast with word processing — without burdening them with technical detail and turning them off.*

On numerous occasions in recent times, I have trained administrative staffs, then employing small minicomputers for word processing, to raise their sights into higher echelons of performance, most notably, data processing. They had little difficulty with DP operator keyboarding, but became glassy-eyed when I attempted to explain the systems aspects of what they were doing. I was forced to address this frontline issue: how to ease the staff into new, more complex applications — in contrast with word processing — without burdening them with technical detail and turning them off before they returned to their jobs.

Now the academicians may take a dim view of my strategy, but what I find works is the design of the training as a series of problem-solving experiences, also known as "cookbook" training. To be sure, this is an idea anathema on the college campus, but it does the job in the industrial setting. The reason for this approach stems from the basic goal of administrative students: the understanding of how to solve those particular information handling problems they face on a daily basis. Cookbook training, in my experience, is applicable to the administrative staff because they tend to operate in accordance with standard operating procedures.

The trainer should select an example from one application area in the business office — an easy one — and drill the students on the computerized solution to it until they get it down pat. Naturally, this takes place in the hands-on environment, using the exact hardware/software configuration being employed in the offices. The instructor should bring the students along step-by-step, covering the procedures for setting up the problem in the computer, entering data, processing the data and obtaining output. When and if the students get this all straight, the trainer continues on to another, more difficult example in the same application area. Finally, the students are given a workshop in which they attempt to solve additional problems on their own, with the instructor present to offer aid and guidance as necessary. ‡

THE MOST IMPORTANT FEATURE YOU'LL FIND IN DIGITAL'S TELEPRINTERS IS THE COMMITMENT BEHIND THEM.

When Digital pioneered the concept of interactive computing some 25 years ago, an interesting side benefit occurred. Out of necessity, we had to develop our first teleprinter.

But rather than simply approaching the task as a sideline, we genuinely committed ourselves to the job of developing a truly outstanding product. The end result was the LA36™ teleprinter. A system that provided far more features, capabilities and durability than most people needed just then. The fact that over 200,000 LA36 teleprinters remain in active duty across the country today is a true testament to the careful thought and foresight that went into the original design.

Each new model introduced since the LA36 teleprinter has been yet another demonstration of our commitment to the needs of the marketplace. And an equally strong demonstration of the market's commitment to us. For the popularity of our products, in several cases, has actually helped drive the industry to adopt new standards. With the introduction of the LA36 teleprinter, for instance, came the wide acceptance of the 300 baud communications rate. And the LA120™ teleprinter helped popularize the faster 1200 baud rate.

Digital's commitment to the teleprinter market remains rock-solid. Our terminals manufacturing plant in Arizona currently produces more teleprinters than ever before. So as long as there's a need for teleprinters, you can count on Digital to fulfill that need. With a product specifically designed for the job.

THE DECWRITER III. THE IDEAL TERMINAL FOR HIGH DUTY CYCLES AND RUGGED ENVIRONMENTS.

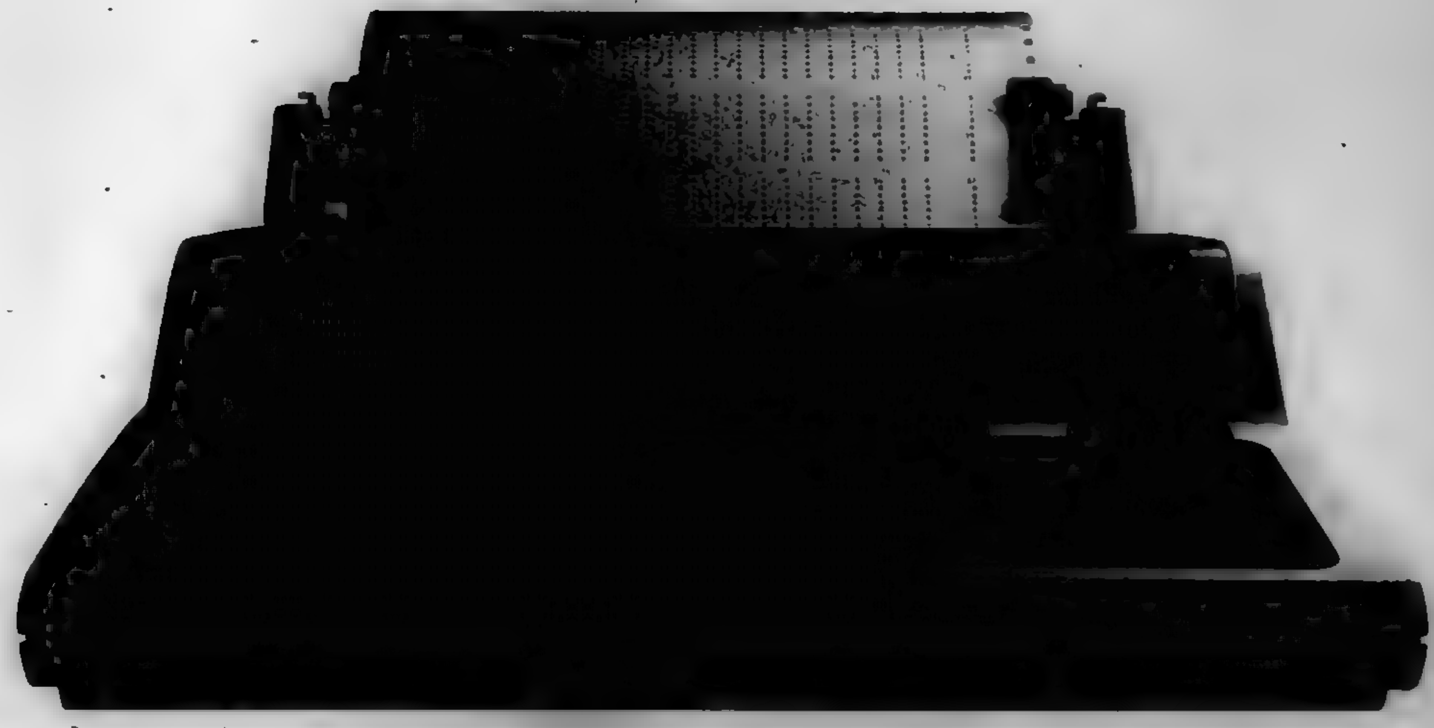
Even the briefest glance explains why the DECwriter III™ (the LA120) teleprinter has established Digital's longstanding reputation in the terminals market. This heavy duty teleprinter is every bit as tough as it looks.

It gives you exactly what you want. Fast draft speed printing at 180 characters per second. Fanfold paper capabilities in widths up to 15". A choice of 8 character widths. And extensive communications support, including auto answerback and auto disconnect.

Most importantly, the DECwriter III teleprinter is a true master of forms. Some 45 features, like horizontal pitch, left/right and top/bottom margins, as well as horizontal and vertical tabs, are all summarized right on the keyboard, allowing you to set up formats in an unusually quick and simple manner. Then, once set, all can be stored in non-volatile memory. And the DECwriter III teleprinter can provide crisp, legible forms up to an impressive 6 parts.

DIGITAL'S LETTERWRITER 100. THE BEST ENGINEERED TELEPRINTER FOR THE OFFICE.

Flexibility is the word that best describes the Letterwriter 100™ teleprinter. For starters, you have a choice of multiple print speeds. You can print a draft copy of a one page proposal in just 10 seconds. Then,



by simply pressing a single button, you can shift from a high speed 240 characters per second to a high quality 30 characters per second, with printing that's difficult to distinguish from true letter quality. There's even an optional 80 character per second memo mode that's ideal for interoffice correspondence.

For further versatility, the Letterwriter 100 teleprinter lets you select from 8 different character widths, multiple character sets and a wide variety of typefaces. In fact, you can store 5 different typefaces resident within the teleprinter, and the selection can include Courier 10, 12, and Italics, Gothic 10 and 12, Orator 10, and APL, so you can select the style that suits the job as easily as pressing a key. And, in the event you'd like to illustrate a particular point, bit map graphics help you do just that.

The Letterwriter 100 can handle the paper that best suits your needs. Sheet, fanfold or roll, in any width up to 15."

Finally, the Letterwriter 100 product tackles all your forms. Setup is simple, and the high quality dot matrix printhead provides crisp, legible copies through 4 part forms.

In short, the Letterwriter 100 is the one teleprinter that finally lives up to the requirements of your whole office.

THE DECWRITER CORRESPONDENT. THE ONLY FULL-FEATURED COMPACT YOU'LL FIND.

In many situations, the applications themselves suggest a clear solution.

But just as often, the solution isn't quite so clear.

That's when you need Digital's Correspondent™ teleprinter. It's the closest thing to an ideal, all-around terminal.

Consider its wealth of features. The Correspondent teleprinter allows you to use ordinary single sheet, roll, or fanfold paper for high quality output that won't fade over time like thermal paper. It also gives you the flexibility to print multiple part forms and labels. And you may customize the text output to your own particular style by selecting from a wide variety of character sets, widths and sizes alone or in conjunction with bit map graphics.

But what makes the Correspondent teleprinter truly impressive is that you get all these features in a compact little 20-pound package. A package complete with three communications interfaces. Not just the usual RS232-C port, but a 300 baud acoustic coupler and a 300/1200 baud modem as well. That means the Correspondent teleprinter can function as a console or as a transportable terminal that can move from desk to desk or office to office, ready to communicate in whatever mode is available.

No matter how you look at it, the Correspondent teleprinter gives you a lot of capability in a small package.

BEST ENGINEERED MEANS ENGINEERED TO A PLAN.

Digital's teleprinters, like all Digital hardware and software products, are engineered to conform to an overall computing strategy. This means that our products are engineered to work together easily and expand economically. Only Digital provides you with a single, integrated computing strategy direct from desktop to data center.

For more information and the name of the Authorized Terminals Distributor or Digital Representative near you, call 1-800-DIGITAL, extension 700. Or write Digital Equipment Corporation, 2 Mount Royal Avenue, UP01-5, Marlboro, MA 01752.

THE BEST ENGINEERED COMPUTERS IN THE WORLD.

'Techno-Bandits' fails to close book on Software AG affair

READER'S PLATFORM
Howard Karten

The excerpt from the forthcoming book *Techno-Bandits* [CW, Sept. 24] covered the affair of Software AG of North America in considerable detail. Yet the excerpt, like the reporting at the time, failed to explore certain questions that have remained unanswered up to today.

I find it curious that none of these questions have been raised; they make me wonder if the whole story has been adequately explored, how well trained Federal Bureau of Investigation personnel are when it comes to computers and how adept they are at combating computer-related crimes.

I am not suggesting anything sinister or conspiratorial — simply that these issues deserve to be answered.

Consider these questions and scenarios.

Insistence on obtaining source code

Why were the Russians so insistent on having the source code in the first place?

They must have been able to deduce that the product operated correctly by and large — after all, it had withstood the roughest test of all, that of the marketplace — and most U.S. users seemed able to get along without source code.

Because they were having so much difficulty obtaining the source code, why risk the success of the whole operation by trying to get the one part that was not, strictly speaking, necessary to have?

Disassemble object code

The Russians have in common with other human beings the ability to be counterproductively single-minded, bull-headed and plain foolish, so let's assume that for their own arcane reasons, they insisted on having source code.

Early on, it would have been clear that getting their hands on the source code would not be an easy job.

In that case, why did they not simply buy a disassembler (or write their own) and disassemble the object code? Surely the Russians have had experience with reverse engineering.

Form dummy company

Continuing this line of thought, how about forming a dummy company as a front, and then hiring a consulting company to disassemble the object code? That might not yield perfect results, but would surely go a long way toward giving the Russians the source code they wanted.

Marc De Geyter's clients must have sensed the difficulty of using at least semilegitimate methods to obtain the source code.

> ***These questions make me wonder if the whole story has been adequately explored, how well trained FBI personnel are when it comes to computers and how adept they are at combating computer-related crimes.***

Given the unending series of obstacles to this course of action, why not simply try to get the information in — as John Houseman might say — the old-fashioned way, by bribery, blackmail or otherwise getting a hold on a company executive who could then make a copy without anyone being the wiser?

Golden opportunity for FBI

Software AG's John Maguire goes to the FBI with the information that the Russians want the source code to his product. It seems to me that this presents the FBI with a golden opportunity : Give them the source code — but first, hire a patriotic, crack programmer to make a few subtle, well-hidden changes that will cause the program to give incorrect results, or to fail at some critical time. At the minimum, this might cause some heads to roll at KGB headquarters.

If I were the FBI, I would certainly want to explore this opportunity to commit some sabotage and be able to deny it at the same time.

And years afterward, in a neat, high-tech, now-it-can-be-told-type piece — the kind at which the bureau is so excellent — the FBI could do a little boasting and restore its faded image.

These questions are fairly obvious ones that should occur to anyone conversant with even elementary aspects of software. Perhaps someone will explore them in the future. Until that time, I suspect the story will be incomplete.

IS A STICK-UP

TRI-DATA'S OZ® GUARDIAN, with Integral 212 Modem, Handcuffs the Single Biggest Instrument of Computer Crime: The Telephone.

Yes, the telephone, one of the most important inventions of our time, is also the most dangerous criminal tool of the computer age.

The ability of individuals to access data housed in computers, by phone, has brought with it the loss of millions of dollars and untold amounts of the most sensitive information.

Stopping access of unauthorized persons has always been tricky, and never a totally fool-proof matter. But the introduction of the OZ Guardian Communications Controller, with a built-in 212A/103 modem, puts a lock on computer theft in ways never before achievable with conventional modems.

First, you get **password verification** that screens calls and verifies passwords. You get **automatic call-back** that can disconnect a call and dial back only to authorized numbers after receiving verified passwords. You get an auto-dial and auto log-on system that eliminates direct use of passwords at the operator level. And you get built-in software that hides the details of network access from the users.

So, when security is your most critical concern—but throughput, cost savings, and ease of use are important considerations as well—do what more phone utilities are doing (and they should know): choose the OZ Guardian by Tri-Data. Don't let the phone stick you up. Pick it up and call Tri-Data today.

WHEN ENGINEERING CRIES FOUL OVER A SHORTAGE OF DISK SPACE, WHAT'S YOUR DEFENSE?

VMCENTER:

THE ONE INDISPENSABLE SURVIVAL TOOL FOR VM DATA CENTER MANAGERS.

Heaven knows those on-line experiments gobble up the megs. But cut off an engineer in mid-byte, and you're in deep trouble.

Which is just one more reason why you need VMCENTER.

VMCENTER is the only comprehensive system that simultaneously addresses all your key concerns as manager of a VM data center. And high on the list of [redacted] management of system resources.

[redacted] facilities include powerful tools for managing disk space—so you'll have space on hand when you need it, without having to buy it when you don't.

And if you prefer, VMCENTER also allows you to assign pools of disk space to individual groups or departments and let *them* manage it—so that if there is a problem, it won't be yours.

[redacted] better space manager and resource [redacted] multi-level security system, a foolproof tape management system, a workload balancer, and a superior system accounting and auditing tool.

Best of all, this capability comes in a proven single-vendor package that's more convenient, more reliable, and more cost-effective than any possible collection of separate piecemeal approaches.

No wonder we call VMCENTER [redacted] hungry engineers—and for you, the manager who has to feed them.

[redacted] VMCENTER, call or write VM Software, Inc., 2070 Chain Bridge Road, Suite 355, Vienna, [redacted] (703) 821-6886.

User finds Big Blue bug

On Sept. 10, IBM Entry Systems Division was notified through formal channels that a significant error existed in the IBM Personal Computer Peachtree General Ledger 1.1 software package. This software package is marketed directly, and supposedly supported, by IBM.

IBM Customer Service Support in Boca Raton, Fla., investigated the error that we had reported and found conclusively that the error did exist and caused the erroneous results as reported. On Sept. 25th, IBM Customer Service rendered the decision "that even though the error exists, and has no doubt existed over the three-year period that this product has been on the market, we do not intend to correct or do anything about it at this time. You are the first to report this problem, so it must not be causing much of a problem."

The problem is the date parameter within the system, and it is in two forms.

■ If you are using the IBM Peachtree General Ledger 1.1 software on an evening-shift basis, and it is 11:00 p.m. and you continue to use the system beyond midnight, the date reflected by the system and encoded on all reports and directories will still be the prior day. The date does not change, even when the internal interval timing has passed 24 hours.

■ The more critical problem is that when you exit the IBM Peachtree General Ledger 1.1 software via normal operating procedures, the date that was loaded into the computer's operating system is obliterated, and the date reflected at the operating system prompt is the base date of the operating system. For example, under DOS 2.10, the date in the system when you exit general ledger to DOS will be 1-01-1980, not the current date that you loaded into the Personal Computer at start-up or boot time or while using the general ledger system.

Unless the user remembers that the date is flushed and reloads it, or unless the user creates a special batch stream to prompt the reloading of the date, any and all file activity from this point forward will contain the incorrect date of 1-01-1980. The user's disk directories will be in error for all files from that point forward. This problem will occur on the Personal Computer, Personal Computer XT and the Personal Computer AT.

Raymond C. Florence Jr.
York, Pa.

LETTER from page 78

overtime) — particularly in maintaining unfamiliar applications. New application development productivity should improve by at least 10:1.

■ Full-feature mainframe DBMS are as complex and sophisticated as equivalent operating systems. "Gut feeling" has no more place in DBMS selection decisions than it has in navigating a ship. Its use will likely put you in the wrong port — if you're lucky.

■ The more multirecord-type selection criteria a retrieval involves, the more efficient a fully inverted-index DBMS becomes, as all selection is done via compact indexes and not by lengthy data searching.

■ There exist today a few DBMS products that serve high-volume traditional applications, yet have superb ad hoc query/report/update/analysis capabilities. Installing multiple DBMS is no more desirable than putting a roller skate on one foot and a ski on the other.

DBMS selection is one of the most important decisions a modern organization will make. It can be fairly equated in impact to the selection of computer hardware itself. No organization can afford to "repent at leisure."

Henry J. Meyer
Norwalk, Conn.

PERFORM from page 79

sometimes incorrect assessments are made, but if an environment of openness and candor can be developed, a reasonable assessment of how these two will work together in the future can be made.

The same thing should apply to the prospective employee and those with whom he will work. The prospective employee should be given some time to meet with several of these people to determine the potential working relationship. If, in talking with these people, the candidate senses a strong interest in maintaining the status quo, while he wants to deal in leading-edge issues, incompatibility is likely. Some contention is desirable within an information processing installation; however, bringing in someone who has views and a philosophy radically different from the rest of the group may lead to difficulty, unless the idea is to attempt to create change.

Using increased care in selecting either a new position or a new employee is by no means a panacea. However, more care on the part of both parties can be beneficial. All concerned benefit from the ability to select employees or jobs where satisfaction, growth and a feeling of belonging are likely to occur.

Candor and openness on the part of all participants can help reduce turnover and increase job satisfaction.

When an employee with the skills, interest and ability does not do well, both the employee and the organization lose. More care in the hiring process can help avoid much mutual loss.

MANY UNIX-BASED SYSTEMS—ONE UNIX TRAINING COMPANY

Three factors make the Computer Technology Group the experts in UNIX and 'C' language training:
- Experience, through training thousands of students worldwide in live seminars, with thousands more using our video training at their locations.
- Extensive Curricula Supporting All UNIX Versions, creating a client base of manufacturers, software developers and end users.
- Quality of instruction, with instructors and course developers who are experts in teaching UNIX and 'C', as well as in designing and implementing a variety of UNIX-based systems.

Experiments In Artificial Intelligence

By Roger C. Schank
with Peter G. Childers

It is clear what we must do next. We must develop systems with flexible, changeable knowledge structures that can learn while doing.

My colleagues and I at the Yale Artificial Intelligence Laboratory write programs in order to crystallize our theories. Ordinarily, our theories encompass such a complex range of processes that we cannot tell if they will do what we thought they would without actually writing the program and finding out. The early versions of programs rarely do fulfill our expectations completely, not unlike a first set of plans by an architect. The finished product, after having undergone numerous revisions, including perhaps a complete recasting of the problem, may bear little relation to the original idea.

Every program we have written at the Yale laboratory has been an attempt to get a handle on a particular problem during our progress in solving some other problem. We may stop briefly and jump for joy at what a completed program does, but soon enough we are

(Excerpted from The Cognitive Computer *by Roger Schank, copyright © 1984, by permission of Addison-Wesley Publishing Co., Inc., Reading, Mass. 01867. All rights reserved.)*

thinking about fixing its problems and moving along to the next program.

The real excitement in AI comes when we realize what we have left out of our previous attempt, which then tells us what to try next. Why we wrote these programs is more important than any of the programs themselves. With this in mind, let me offer a look at some of the programs we have produced over the last decade.

Work on natural language processing began in the 1960s, but those initial attempts bear almost no resemblance to our approach today. These researchers, whether they happened to be in computer science or linguistics, started out by attempting to find the formal rules that might underlie language itself. This approach may not seem wrong in principle, but the question, *What is language?* is not quite the same as the question, *How do humans understand one another?*

Early research concentrated on the outer form of language rather than on the content of communication and focused on getting a computer to break down a sentence into its parts of speech rather than into its elements of meaning.

These early researchers first attempted to build a parser. They wanted the computer to parse or convert sentences into grammatical structures according to standard grade-school rules. These programs told the computer how to find the noun phrases, verb phrases, prepositional phrases and so on in a sentence by using the rules of how sentences are constructed. These investigators hadn't really given any thought to what would come after that. They never succeeded in writing down all the grammar rules and found themselves with a lot of unanswered questions about how to get the computer to use language effectively.

On the surface, at least, language is composed of vocabulary, grammar, syntax and semantics (whatever that is). But this kind of definition doesn't tell us much about what language has to do with understanding. Language is, above all, a medium for communication between people. It cannot be correctly analyzed without considering what kinds of ideas people want to express. Language must be treated as a vehicle rather than an entity in and of itself.

The statement *I want ice cream* isn't effectively analyzed if all we do is break it up into its subject and predicate. If a child came out with this sentence, we wouldn't reply to him, *All right, subject, I'll bring you some direct object.* But this is what programs that rely primarily upon syntactic rules, as well as some of the commercial systems now available, actually do. They match words in certain syntactic slots (the head noun, for instance) to field names in data bases. This allows them to find the information about "employees" under "employees" in the data base. But since these programs have no idea what "employee" means, heaven help them if the user of the system should mistakenly refer to them as "wage earners" or, worse yet, ask about the "money people make" instead of using the correct field name, "salary."

Playing doctor

Other early programs searched for key words or phrases in sentences without regard for the role of those words in the sentence or their meaning. This yielded programs that at most demonstrated people's gullibility. The most frequently cited examples of this approach are programs that simulated some of the questions and answers that a Rogerian psychiatrist might offer.

It isn't difficult to see how one could create a very simple program that appears to mimic a psychiatrist. In keyword systems, the computer can print messages that previously were composed by people when the program tells it to do so. A machine that prints "HELLO" when you type "Hello" might seem to be communicating, even though such behavior proves nothing about understanding.

This method of printing certain messages in response to certain inputs works well enough if your goal is to achieve not understanding but simply the appearance of understanding. One rule you might give such a program would be that whenever the program sees the words *mother, father* or *parents* in the user's input, the program should print, *Tell me about*

UNIX MULTIPROCESSOR PERFORMANCE AND EXPANDABILITY IN ONE BOX

NOW

ELXSI System 6400 has a true native port of UNIX System V, not an emulation. With a unique combination of Berkeley enhancements. Virtual memory. Super fast I/O. Ethernet with TCP/IP. Plus the largest physical memory in the business. ELXSI System 6400 will run either UNIX or our proprietary, message-based EMBOS operating system. Or both, concurrently.

ELXSI System 6400: The first true multiprocessor UNIX system. Up to 5 CPU's operating at 20 MIPS in a single cabinet, through the ELXSI Gigabus—our 320 mByte/second, 64-bit wide system bus that can accommodate further expansion up to 10 CPU's and 40 MIPS of computing power. More power for more system users, expandable as your needs grow, with the highest power to footprint ratio in the business.

ELXSI System 6400. No one can match our performance or our expandability, deliverable now. Contact ELXSI today for complete information. Sales offices in most major cities.

THE ELXSI GUARANTEE: find a computer system that can match our performance and our potential for expansion, and we'll raise our price to match theirs.

your relationship with your ______, tacking on whichever word had appeared in the user's input. This will work well enough when the input is, *My mother made me come here*. But the user might type in, *My ring is made of mother of pearl*, or *Do you read* Mother Jones *magazine?* The computer would use the same rule in each case and reply, *Tell me about your relationship with your mother.*

This ridiculously simple rule may indeed convince the user that he is talking to a psychiatrist who wants to bring the discussion around to the user's parental relationship. It also may convince the user that he is talking to an idiot. (When I showed one of the more sophisticated of these programs to a psychiatrist, he concluded that a computer program that was supposed to model paranoia instead had brain damage, a diagnosis that may have been more accurate than he realized.)

When this program failed to see any of the "parents" words in the user's first few statements, it would print, *You haven't talked about your family very much.* This gives the user the impression that the computer thinks he is avoiding the subject; however, the computer isn't thinking anything. Instead, it has been programmed to count the number of statements until it has to print that message. Another very simple, yet highly deceptive, print rule would be to tell the computer to print what the patient has said, changing only the personal pronouns and perhaps a few other words. This can have the effect of encouraging the user to think about what he has said and to elaborate on it. A conversation like the following might take place:

COMPUTER: You haven't talked about your family very much.

USER: Yes, well, I didn't get along with my family very well.

COMPUTER: You didn't get along with your family.

USER: Well no, not for most of my childhood.

COMPUTER: Not for most of your childhood.

USER: That's right. My parents were always critizing me.

COMPUTER: Your parents were always criticizing you.

USER: Yes. They never thought I was a good person.

COMPUTER: What does your father do?

USER: He's a professor.

COMPUTER: How do you feel about professors?

The computer can't miss with the last question. The computer has been given a simple rule telling it to let the user make two or three statements after the family question, replying to them only by repeating them, and then ask, *What does your father do?* Of course, as happened in one instance when these types of programs were being taken rather seriously, if a user responds, *He's dead*, the computer's response, *How do you feel about deads?* can be fairly irritating. Such a program obviously doesn't exhibit much true understanding.

The point here is that the program anticipates certain key words and responds to them with certain canned responses. A computer programmed to convert the statement *I hate you* to *Why do you hate me?* doesn't understand anything, doesn't have any expectations or knowledge structures for what it says and, most important, doesn't tell us anything about the nature of human understanding. (It does serve to test a hypothesis that I assume no one ever had, namely, that people respond to sentences by parroting back what they heard. Some people may well do this — they may even get paid to

> *In the late '60s, researchers began to look at the underlying problems of language — the nature and representation of meaning — in the hope of developing a completely new approach to natural language processing.*

Oh, the joys of being a DP professional.

Every job has its share of problems. But DP professionals seem to be blessed with more than their fair share.

We can help you do away with some of the grief and hassle. Things such as JCL errors, production foul-ups, and network breakdowns.

Our JCLCHECK™ program spells "relief" from JCL problems. It catches all JCL errors, gives you complete, on-line error validation and concise diagnostics. Plus full documentation on a job stream, or entire production system, suitable for insertion in the run book.

Our ProDict™ program is the instant remedy for production headaches. It's an automatic, on-line dictionary of all your production jobs, data sets and programs, that can save you the hours, days, even weeks now spent manually searching listings. It makes possible better scheduling, reliable contingency planning, and faster disaster recovery.

Our NetCheck™ program takes the pain out of taking control of your CICS network. It allows you to organize your network in manageable groups with easy-to-remember names. It enables you to bring up the network in just minutes. And troubleshoot problems in seconds. So things get done faster and easier, with you in control of your network, instead of vice versa.

For all the details on JCLCHECK, ProDict, and NetCheck send the coupon, or call us at (408) 554-8121. We'll deliver fast, long-lasting relief.

The New Cincom: 10
the only software ve

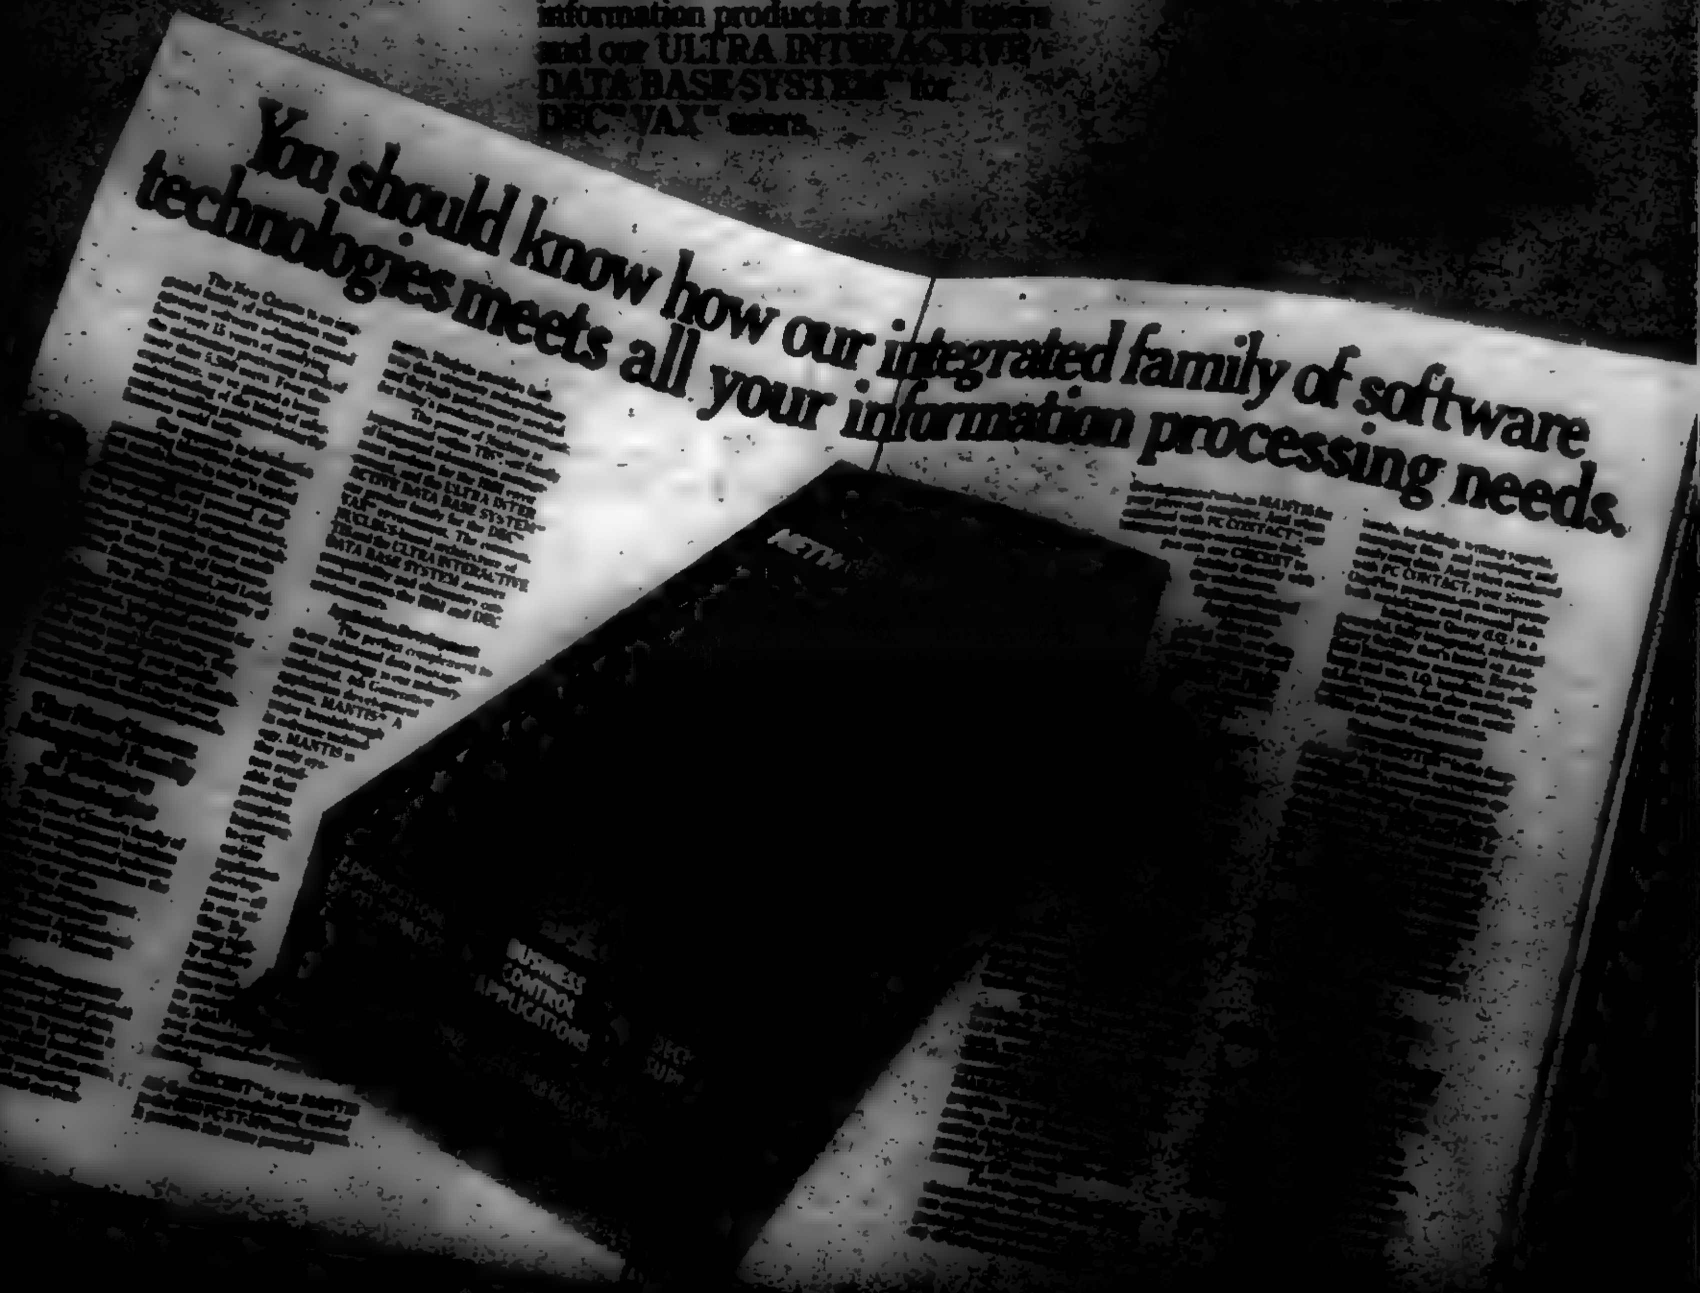
Finally, there's one software vendor offering a sophisticated software information network capable of meeting all of your corporate, departmental and personal information software needs—The New Cincom Systems. Organizations around the world are discovering that working with Cincom's integrated family of products enables them to greatly improve both performance and productivity. Here are [illegible] the many reasons why [illegible] considering the New [illegible] information network [illegible] company:

#1 Relational Data Management Technology

Powerful relational data management technology forms the "nucleus" of our software information network. Using a unique "Logical View" concept, all applications operate directly with "derived relational tables." As a result, we can provide complete data structure independence, as well as the high performance needed for today's production environments. This relational technology is the nucleus of both our TIS™ family of information products for IBM users and our ULTRA INTERACTIVE DATA BASE SYSTEM™ for DEC™ VAX™ users.

#2 Fourth Generation Application Development

The perfect complement to our relational data management technology is our industry acclaimed 4th Generation application development system, MANTIS™. In more than 1,500 complex production environments, MANTIS is dramatically reducing the application backlog through its powerful ability to "prototype," refine and commit the application to production in one interactive setting.



You should know how our integrated family of software technologies meets all your information processing needs.

reasons why we're
ndor you'll ever nee

technology. A complete closed-loop system, MRPS is improving the productivity and profitability of over 125 IBM and DEC VAX manufacturing environments around the world.

Excellence in software technology.

CW 11/12

do it — but as a theory of understanding it falls apart rather quickly).

If the user said, instead, *The very sight of you makes me want to throw up*, the computer wouldn't understand. A tricky programmer might have told it to print, *Are you feeling ill?* whenever it saw the words *throw up*. This program would be no more than a set of tricks. It might initially look convincing, but it wouldn't take long to get exasperated with it.

In the late '60s, researchers — myself included — began to consider problems of meaning as central to the development of natural language processing by humans or computers. We began to look at the underlying problems of language — the nature and representation of meaning — in the hope of developing a completely new approach to natural language processing. The best way to appreciate how far we have come is to look at various programs and see how we progressed from one to the other.

The programs I have chosen to discuss were all done under my direction, since it seems most sensible to discuss the work I know best.

The programs

My students and I decided that it would be better to try to extract meanings from sentences than to extract grammatical units from sentences. Where the old objective of a parser was to make a grammatical analysis of a sentence, we decided that the new objective should be a meaning analysis of the sentence. In other words, rather than concentrate on how a sentence was constructed, we worried about how to represent what was happening in the event that the sentence describes. Our aim was to write programs that would concentrate on crucial differences in meaning, not on issues of grammatical structure.

This view redefined the parsing problem. We used whatever grammatical rules were necessary in our quest to extract meanings from sentences but, to our surprise, little grammar proved to be relevant for translating sentences into a system of conceptual representations. While I was at Stanford in the late '60s and early '70s, we began work on a program that could parse English sentences into conceptual representations. At the same time, we began to build a generator, that is, a program that could take conceptual representations and make English out of them. We realized that if you could extract the meaning from a sentence by representing it conceptually, you had better be able to retrieve the English or you would have lost information in the process.

If early work on parsing was overly concerned with syntax, the work on generation of sentences by computer was even worse. Early efforts on the generation of English sentences had concentrated on the problem of generating random sentences. Because the computer had nothing to say, generating sentences only could serve as an exercise in the grammatical construction of a sentence. But the moment we had achieved even the crudest levels of language understanding — the most primitive form of meaning representation — we realized that we needed a generator right away. Like the parser, the generator had to be constructed from new principles.

> ***Our aim was to write programs that would concentrate on crucial differences in meaning, not on issues of grammatical structure.***

From the very beginning, the theories of language generation that evolved in AI looked considerably different from those developed in fields that were concerned with language per se rather than with understanding. An AI generator has to express what the computer wants to say. However, getting a computer to have something to say poses a problem. In this first stage, the computer just "wanted" to express what it had just parsed, so we could start with a meaning and then find a form to express it, rather than the other way around.

In linguistics, for example, rules for the generation of sentences started with the idea that because a sentence consisted of a noun phrase and a verb phrase, the generation of a sentence required the selection of a noun phrase and, hence, a noun. Thus, generating a sentence meant just finding its form and then finding a meaning to fit that form. Clearly, this method would not work for either computers or people.

The basic intent of our work was to provide unique representations for ideas that could be expressed in many ways. Because of this, our programs could understand an event to be the same one as one seen previously, even if the previous expression of that event had been quite

different. The conceptual representations that we devised were intended to facilitate the automatic paraphrasing of a sentence that the program read — and even the translation of that sentence into other languages.

We connected the generator to the parser to get a paraphrasing program. We found some graduate students who knew German and Chinese, so they went to work on building generators for those languages, which gave us the ability to develop translations of a sentence. Translation followed rather naturally from what we were doing. Once the parser represented the meaning, encoding that meaning into a language again was just as complex a task whether the language was English or Chinese. As long as the representation had no language-specific parts, that is, if it were truly conceptual, translation and paraphrase were essentially the same task.

By 1973 we could parse, generate, paraphrase and even translate sentences. We did not yet have an understanding system, but we had a new view on the problem and a cascade of solutions and new ideas.

```
INFERENCE MODE
INPUT:       John told Mary that Bill wants a
             book.
OUTPUT1:     A book about what?
OUTPUT2:     Mary knows that Bill wants a
             book.
OUTPUT3:     Bill wants to come to have a
             book.
OUTPUT4:     Bill wants someone to cease to
             have a book.
OUTPUT5:     Bill wants to read a book.

INPUT:       John gave Mary a beating with
             a stick.
OUTPUT1:     A stick touched Mary.
OUTPUT2:     Mary became hurt.
OUTPUT3:     John wanted Mary to become
             hurt.
OUTPUT4:     Why was John angry?

INPUT:       John gave Mary an aspirin.
OUTPUT1:     John believes that Mary wants
             an aspirin.
OUTPUT2:     Mary is sick.
OUTPUT3:     Mary wants to feel better.
OUTPUT4:     Mary will ingest the aspirin.

INPUT:       John is going to go to the
             store.
OUTPUT1:     John wants to be at the store.
OUTPUT2:     What does John want to buy?
OUTPUT3:     John will trade money to the
             store for something.

PARAPHRASE MODE

INPUT:       John advised Mary to drink the
             wine.
OUTPUT:      John told Mary that drinking
             the wine would benefit her.

INPUT:       John killed Mary by choking
             Mary.
OUTPUT1:     John strangled Mary.
OUTPUT2:     John choked Mary and she
             died because she could not
             breathe.
OUTPUT3:     Mary died because she was
             unable to inhale some air and
             she was unable to inhale some
             air because John grabbed her
             neck.

INPUT:       Reading the book reminded
             Rita to loan the book to Bill.
OUTPUT:      Rita remembered to give the
             book to Bill and she expects
             him to return it to her because
             someone read the book.

INPUT:       John prevented Bill from giving
             a banana to Mary by selling a
             banana to Rita.
OUTPUT1:     Bill was unable to give a ba-
             nana to Mary because Rita
             traded John some money for a
             banana.
OUTPUT2:     Mary could not get a banana
             from Bill because Rita bought a
             banana from John.
```

Figure 1. The Margie program, 1973

Margie. Where did we go from there? Clearly, paraphrasing is not all we can do when we read a sentence. We can extrapolate from the smallest amount of information. The full meaning of a sentence is more than the sum of its parts. People speak in a kind of shorthand, expecting that their listeners will fill in assumptions as needed. We needed to program the computer to understand not only by extracting meanings from sentences, but also by making inferences. We began to develop a theory of inference and built an inferencer.

Then someone suggested that we should put the parser, inferencer and generator together in one big program, so we did and called it Margie.

Margie stood for Memory, Analysis, Response Generation in English. (Margie also is the name of my mother.) This was the first time anyone had created a system that could paraphrase meanings, translate and draw inferences from sentences.

Margie was our first attempt to parse English into conceptual representations. It consisted of three separate programs: a parser, which we called a conceptual analyzer to distinguish it from other syntactic parsers (the parser was written by Christopher Riesbeck as part of his Ph.D. work at Stanford); an inferencer (written by Chuck Rieger as part of his Ph.D. work at Stanford); and a generator (written by Neil Goldman as part of his Ph.D. work at Stanford).

The output in Figure 1 shows Margie in two different modes of operation. In the Inference mode, all three programs were linked together. The parser sent its output to the inferencer, which then made inferences and sent them to the generator to be expressed in English. In the Paraphrase mode, the parser decomposed the sentences into conceptual representations, and then the generator expressed those representations in a number of different ways that showed the power of the representations.

No sooner did we gain some success than we began to see trouble ahead or new problems to work on. Margie showed us that inferencing required careful control. We had 16 basic rules of inference, each of which was used every time the computer read a sentence. These rules were fairly simple, but the goal was merely to test some ideas about

inferencing. Since people also make inferences from inferences, the program subjected the new conceptual representations that it had derived from the inference process to the 16 rules of inference and generated inferences from each of them.

A combinatorial explosion of inferences quickly resulted. Some of the new inferences were valid and sensible, but many were ridiculous and irrelevant. Our new problem involved getting the computer to know the difference.

Two important theoretical issues emerged from the work on Margie. First, we had to find a way to focus the inferencing process in such a way as to pursue only reasonable paths at reasonable levels of detail. The second problem, related to the inference explosion problem, had to do with the initial restrictions placed on Margie. Margie handled individual sentences that were unrelated to one another.

We developed a system of causal chaining, principles that allowed the computer to tie the meaning of one sentence to that of the next sentence by attempting to infer the connections between them.

We began to concern ourselves with the differences between understanding sentences by themselves, out of context, and understanding cohesive paragraphs which themselves were part of a larger context. We could parse sentences individually, but we had no idea what it would mean to relate them to one another. If we wanted a computer to process and understand text, then a program would have to be able to connect one sentence to the next.

Fortunately, these two problems were related. Inference explosions aren't as likely to occur in context, since we have a sense of what a paragraph is really about. Understanding in context, therefore, poses a fundamentally different program from the one presented to Margie. Serendipitously, the same basic parsing and generation techniques did apply.

Sam. I sat in a villa by a lake for a year working on these two problems. (An AI researcher doesn't need a computer most of the time. All he needs to begin with are a pencil and paper.) Both problems, inference explosion and connected text, were intimately related and could be solved with similar mechanisms. We developed a system of causal chaining, principles that allowed the computer to tie the meaning of one sentence to that of the next sentence by attempting to infer the connections between them. For example, one of the results of the first sentence might have to do with enabling an action in other sentences in the paragraph.

At Yale in 1974, we began to try to program rules for causal chaining to limit inferences during the reading of stories. But some connections between sentences couldn't be figured out as if they were "logical." It isn't "logical" to think that looking at a menu naturally precedes eating in the context of a restaurant. People don't attempt to figure out the connection between these two events each time as if it were the first time they had encountered such a situation.

Scripts were invented by Robert Abelson (a psychology professor at Yale) and me to solve this problem. They enabled the computer to process stories by providing rules for

Input:

Friday evening a car swerved off Route 69. The vehicle struck a tree. The passenger, a New Jersey man, was killed. David Hall, 27, was pronounced dead at the scene by Dr. Dane Blanchard, medical examiner. Frank Miller, 32, of 593 Foxon Rd., the driver, was taken to Milford Hospital by Flanagan Ambulance. He was treated and released. No charges were made. Patrolman Robert Onofrio investigated the accident.

English summary:

```
AN AUTOMOBILE HIT A TREE NEAR HIGH-
WAY 69 FOUR DAYS AGO. DAVID HALL, AGE
27, RESIDENCE IN NEW JERSEY, THE PAS-
SENGER, DIED. FRANK MILLER, AGE 32,
RESIDENCE AT 593 FOXON ROAD IN NEW
HAVEN, CONNECTICUT, THE DRIVER, WAS
SLIGHTLY INJURED. THE POLICE DEPART-
MENT DID NOT FILE CHARGES.

```

Question-answering output:

```
Q1: Was anyone killed?
A1: YES, DAVID HALL DIED.

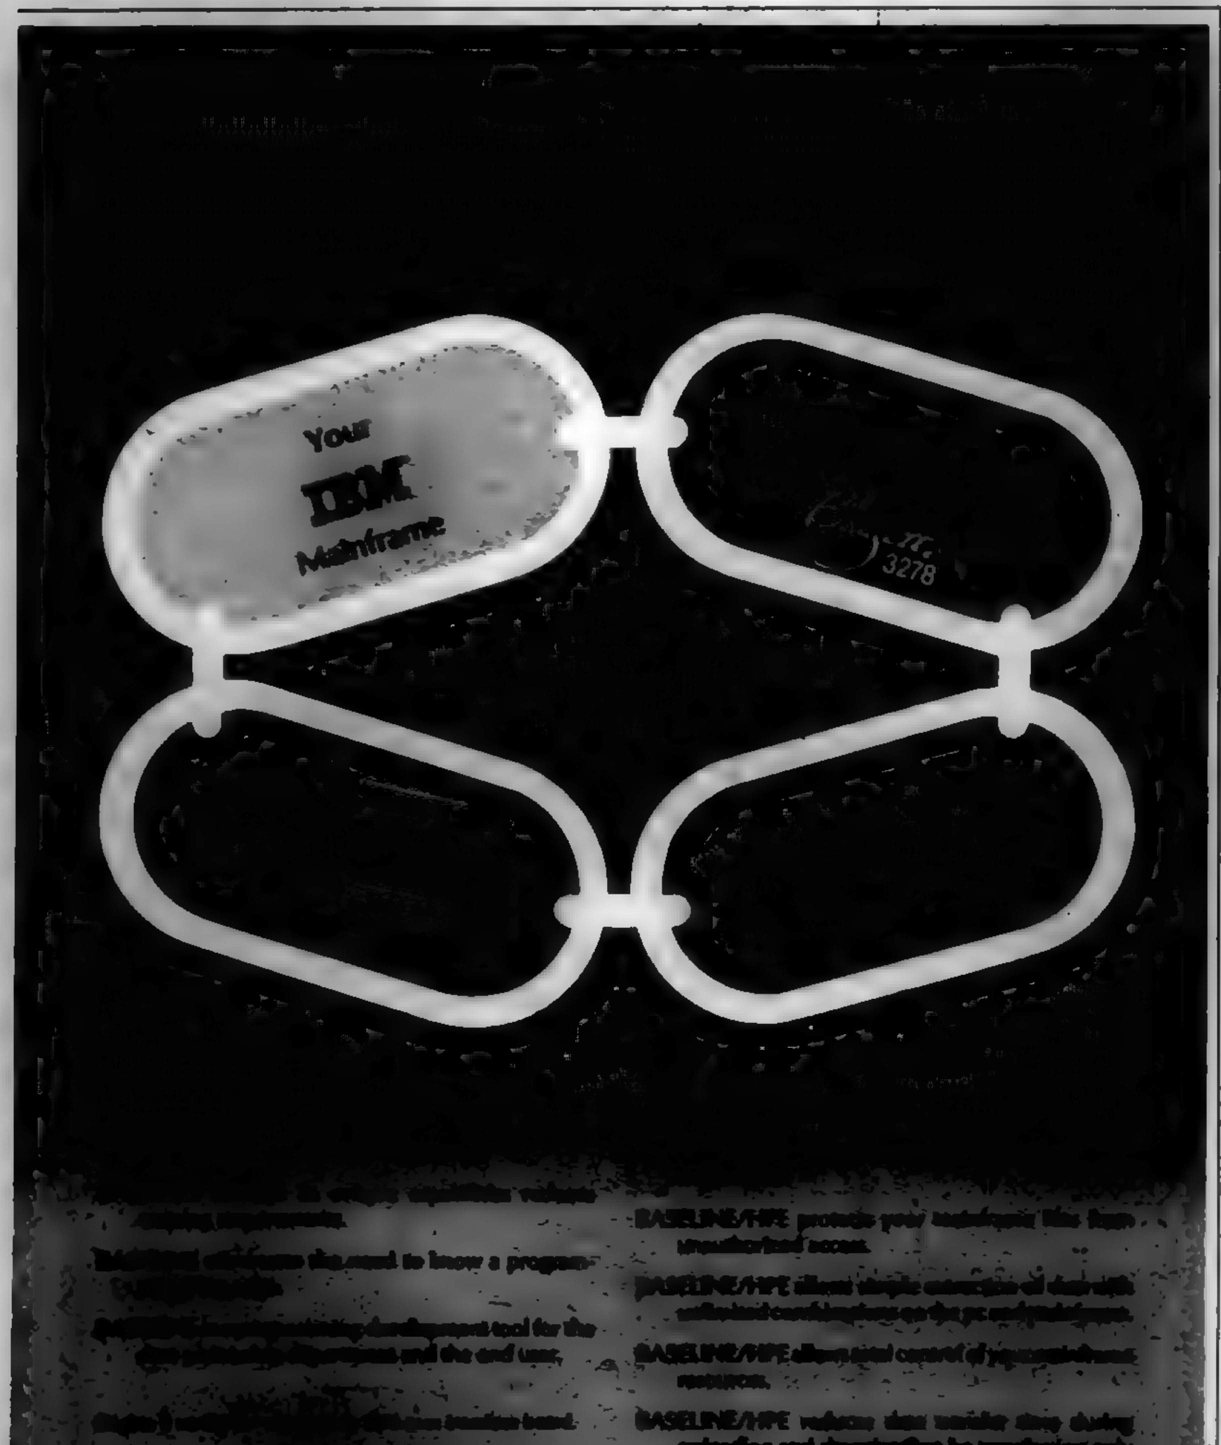
Q2: Was anyone hurt?
A2: YES, FRANK MILLER WAS SLIGHTLY
    INJURED.

Q3: Why was Miller hurt?
A3: BECAUSE THE AUTOMOBILE HIT THE
    TREE.

Q4: Did Miller go to the hospital?
A4: YES, HE WAS IN THE MILFORD HOSPI-
    TAL.

Q5: How did Miller get to the hospital?
A5: THE FLANAGAN AMBULANCE COMPA-
    NY TOOK HIM TO THE MILFORD HOSPI-
    TAL.
```

Figure 2. The Sam program, 1975



understanding the connectivity in a stereotypical situation. We wrote Sam (Script Applier Mechanism), a program that could read stories that were scriptlike or script based (see Figure 2).

Sam could read a variety of stories, including actual newspaper stories on specific subjects. Since we already had the translation ability that the conceptual parsers and generators from Margie provided, we could translate the stories that we read into other languages. We concentrated on car accident stories because they were both scriptlike and plentiful.

We built programs to translate car accident stories from the *New Haven Register* into Russian and Spanish. A few people who knew both languages would look at the Russian and Spanish versions of a story and say, *Hey, these aren't exact translations of each other.* We told them no, they weren't exact translations of each other. The student who had written the Russian generator wrote it differently from the one that the Spanish-speaking student had written. Each system was independent, and the meaning representations used reflected not only linguistic but also cultural differences. (The Russian-speaking student reported, for example, that Russian newspapers never report car accidents, so he had a fair amount of difficulty just deciding what vocabulary to use.)

The translation modules converted the conceptual representations that Sam produced into an appropriate expression in the target language.

Sam had four basic modules. It used the parser and generators from Margie, although they were in a somewhat modified form. The center of the program was the Script Applier, which also contained a memory and inference part. The Script Applier was written by Richard Cullingford as part of his Ph.D. thesis at Yale. He also put all the other pieces together to make it all work.

A question-answering module attempted to figure out the intention of a question and give the memory a clue as to where the answer might be found in the conceptual representation of the story that had been produced by the Script Applier. The question-answerer was written by Wendy Lehnert as part of her Ph.D. thesis at Yale. The Russian generator was written by Anatole Gershman and the Spanish one by Jaime Carbonell.

Once again, what Sam could not do made it obvious what to do next. We had been dealing with highly restricted scripts, but real stories contain interesting complications and unusual consequences. Stories have characters who find novel ways to get what they want, characters who act without resorting to a script. We had to start developing structures that allowed the computer to understand a character's plans and goals.

In order to understand a story about a liquor store robbery, we could have created a liquor store robbery script. But most people don't have such a script, having neither observed nor participated in a liquor store robbery. We could have given the computer a large range of understanding by giving it an endless number of scripts, but when it found itself without a script, it would have

```
INPUT TEXT:

        John wanted money.
        He got a gun and walked into a liquor
        store.
        He told the owner he wanted some
        money.
        The owner gave John the money and
        John left.

INPUT:      Why did John get a gun?
OUTPUT:     Because John wanted to rob
            the liquor store.

INPUT:      Why did John threaten the
            shopkeeper?
OUTPUT:     Because John needed to get
            some money.

INPUT:      Why did the shopkeeper give
            John the money?
OUTPUT:     Because the shopkeeper
            didn't want to get hurt.

INPUT:      Why did John leave?
OUTPUT:     Because John didn't want to
            get caught.

OUTPUT:

STORY FROM JOHN'S POINT OF VIEW:
        I needed to get some dough. So I got
        myself this gun, and I walked down to
        the liquor store. I told the shopkeeper
        that if he didn't let me have the mon-
        ey then I would shoot him. So he
        handed it over. Then I left.

OUTPUT

STORY FROM THE OWNER'S POINT OF
VIEW:
        I was minding the store when a man
        entered. He threatened me with a gun
        and demanded all the cash receipts.
        Well, I didn't want to get hurt, so I
        gave him the money. Then he es-
        caped.
```

```
INPUT TEXT:

        John wanted to win the stockcar race.
        Bill also wanted to win the stockcar
        race.
        Before the race John cut Bill's ignition
        wire.

INPUT:      Why did John break an ignition
            wire?
OUTPUT:     Because he was trying to pre-
            vent Bill from racing.

INPUT:

        JOHN WANTED BILL'S BICYCLE.
        HE WENT OVER TO BILL AND ASKED
        HIM IF HE WOULD GIVE IT TO HIM.
        BILL REFUSED.
        JOHN TOLD BILL HE WOULD GIVE HIM
        FIVE DOLLARS FOR IT.
        BUT BILL WOULD NOT AGREE.
        THEN JOHN TOLD BILL HE WOULD
        BREAK HIS ARM IF HE DIDN'T LET
        HIM HAVE IT.
        BILL GAVE HIM THE BICYCLE.

        QUESTION: Q1
                Why did John walk over to Bill?
                Because he wanted to get his
                bicycle.

        QUESTION: Q2
                Why did Bill give his bicycle to
                John?
                Because he didn't want to get
                hurt.

        QUESTION: Q3
                What were the consequences
                of John's walking over to Bill?
                This enabled him to ask him to
                give him Bill's bicycle.

        QUESTION: Q4
                What were the consequences
                of John's asking Bill to give him
                Bill's bicycle?
                Bill told him that Bill wouldn't
                give him Bill's bicycle.

```
The US Congress is expected to approve the
Panama Canal Treaty.

CONSERVATIVE MODE:

INTERPRETATION COMPLETED, READY TO
ACCEPT QUESTIONS.

Q1: Should the US approve the treaty?
A1: NO, THE TREATY IS BAD FOR THE UNIT-
    ED STATES.

Q2: Why is the treaty bad for the US?
A2: THE UNITED STATES WOULD LOSE THE
    CANAL TO PANAMA AND THE UNITED
    STATES WILL BE WEAKER.

Q3: What might happen if the United States
    loses the Canal?
A3: RUSSIA WILL TRY TO CONTROL THE
    CANAL.

Q4: Why would Russia try to take over the
    Canal?
A4: RUSSIA WANTS TO EXPAND ITS MILI-
    TARY CONTROL. THE PANAMA CANAL
    HAS HIGH MILITARY VALUE.

Q5: How might this happen?
A5: THE UNITED STATES MAY NOT BE
    ABLE TO STOP ANYONE TAKING OVER
    THE PANAMA CANAL. TORRIJOS IS A
    COMMUNIST. TORRIJOS WILL LET RUS-
    SIA CONTROL PANAMA.

Q6: Why should the US worry about Russia
    taking over the Canal?
A6: BECAUSE RUSSIA WANTS TO CONTROL
    THE WORLD.

Q7: What should the US do to stop Russia
    from taking over the Canal?
A7: CONGRESS SHOULD VOTE AGAINST
    THE PANAMA CANAL TREATY.

LIBERAL MODE:

INTERPRETATION COMPLETED, READY TO
ACCEPT QUESTIONS.

Q1: Should the US approve the treaty?
A1: YES, THE PANAMA CANAL TREATY IS
    GOOD FOR THE UNITED STATES.

Q2: Why is the treaty good?
A2: THE PANAMA CANAL TREATY IM-
    PROVES RELATIONS WITH LATIN
    AMERICAN COUNTRIES.

Q3: What happens if the US keeps the Ca-
    nal?
A3: THIS WILL CAUSE DISCONTENT AND
    CONFLICT IN PANAMA AND LATIN
    AMERICA.

Q4: Why would this lead to conflict?
A4: THE CANAL ZONE IS A UNITED STATES
    COLONY. LATIN AMERICA DOES NOT
    LIKE COLONIALISM. THE UNITED
    STATES WOULD MAINTAIN COLONIAL-
    ISM.

Q5: What if Russia tries to take over the ca-
    nal?
A5: RUSSIA DOES NOT WANT CONFLICT
    WITH THE US. RUSSIA WILL STAY OUT
    OF THE CANAL IF THE UNITED STATES
    DEFENDS IT. THE UNITED STATES DE-
    FENDING THE CANAL IS PART OF THE
    TREATY.

Russia is massing troops on the Czech bor-
der.

CONSERVATIVE MODE:

INTERPRETATION COMPLETED, READY TO
ACCEPT QUESTIONS.

Q1: Why did Russia do this?
A1: BECAUSE RUSSIA THOUGHT THAT IT
    COULD TAKE POLITICAL CONTROL OF
    CZECHOSLOVAKIA BY SENDING
    TROOPS.

Q2: What will Russia do next?
A2: RUSSIA MAY TELL ITS TROOPS TO
    START THE INVASION.

Q3: What else can Russia do?
A3: RUSSIA MAY WAIT FOR CZECHOSLO-
    VAKIA TO GIVE IN TO RUSSIAN DE-
    MANDS.

Q4: What happens if Czechoslovakia does
    not give in?
A4: RUSSIA MAY DECIDE TO START THE IN-
    VASION.

Q5: What should the United States do?
A5: THE UNITED STATES SHOULD INTER-
    VENE MILITARILY.

Q6: What else can the United States do?
A6: THE UNITED STATES CAN DO NOTH-
    ING, OR IT CAN INTERVENE DIPLOMAT-
    ICALLY BY CONFERRING WITH RUSSIA
    ABOUT CZECHOSLOVAKIA. THESE AL-
    TERNATIVES ARE BAD FOR THE UNIT-
    ED STATES.

Figure 5. The Frump program, 1979

been stymied. We had to give the computer methods for dealing with the world when it did not have an applicable script.

Pam. As a way of exercising our ability to program plan and goal structures, we were building Tale-Spin at the same time we were building Sam. This was the first program to make up its own stories using just some principles of storytelling and rules for planning in an imaginary world.

We then used these ideas of how people plan to achieve goals to help in getting computers to understand stories by building Pam (Plan Applier Mechanism), a program that attempted to understand the world in terms of the rules we have for resolving goal conflicts, achieving temporarily blocked goals and so on.

Pam was written by Robert Wilensky as part of his Ph.D. thesis at Yale. The generator used by Pam was different from our Margie generator. The generator for Pam was written by Richard Granger. Because Pam used goals to track its characters, it was possible to tell stories from the viewpoint of those characters. We also added some vocabulary typical of different types of people to make the output seem realistic.

The vocabulary trick was showy

DJC
Recommends Digital Terminals

For Video Display And Printers There's No Name Like Digital

The VT™ 200 family sets a new standard in video terminals. Included are the VT 220 a conversational text only terminal; the VT 240, for text and interactive monochromatic business graphics; and the VT 241, featuring full color graphics. All are compatible with the popular VT 100 series.

Digital's family of printers can fill all your needs. The Letter Print 100 (LA™ 100) gives you three printers in one—draft quality, letter quality and graphics. The LA 50 Personal Printer adds efficient, low cost printing to any personal computer. These new Digital printers feature the same quality and reliability that made the LA 120 the top rated heavy duty Matrix printer in its class.

DJC stocks Digital, both videos and printers—so call DJC, the leader in peripheral distribution, and ask for Digital.

"The computer is down."

It is ironic that when we become dependent on computers, we are at their mercy. As more and more companies go on line, the industry reliability standard of 98.5% becomes unacceptable because it means your computer is liable to go down once every two weeks, on a statistical average.

So, if you are a broker, banker, manufacturer, or businessman who relies on your computer more and more, take note: Stratus Computers are designed not to fail; not once every two weeks, or once every 200 weeks, or once every 2,000 weeks!

Debunking The Myth That All Fault Tolerant Computers Cost More.

It is a common and reasonable assumption that because there is redundancy (extra programming, or extra components) in fault tolerant computers, that makes them cost more. Where the redundancy is in expensive software, this is true. But Stratus has hardware-based fault tolerance that takes advantage of the extraordinary advances in chip technology. The result – price drops. The fact of the matter is, our hardware redundancy adds a mere fraction to our cost, and absolutely nothing to your purchase price. What's more, in overall price/performance comparisons against the top computer names, including IBM, DEC, and Hewlett Packard, Stratus was at the front of the pack, despite the fact that it included fault tolerance, while the others didn't.

	STRATUS XA400	IBM 4381	HP 3000 68	DEC VAX-11/782
RELATIVE PERFORMANCE*	125	100	64	109
PRICE	$446,350	$707,897	$437,754	[illegible]
PRICE PERFORMANCE	$ 3,571	$ 7,079	$ 6,840	$ 5,999

Relative Price Performance Index

*Computerworld, August 20, 1984

All systems are comparably configured with identical amounts of memory, disk space, and communication lines. But, only the Stratus price includes fault tolerance.

Why Stratus May Be The Best Computer For The Times, For The Money.

Considering its showing in overall price/performance comparisons against the most successful computers, Stratus must be considered. And when you take into account the added efficiency and security of fault tolerance, and the fact that it is the world's most powerful fault tolerant transaction processing computer, Stratus truly becomes impossible to ignore. In the 1980's Stratus simply is the right computer, at the right price. For information, contact your local Stratus sales office, or call Keith Johnson in Massachusetts at (617) 460-2188, or toll-free at 1-800-255-1515.

Stratus.

CONTINUOUS PROCESSING™

Now that the world relies on computers it needs a computer it can rely on.

Now you can offer your customers a service program as good as your product.

Honeywell's nationwide service organization is now available to other companies.

We call it TotalCare™ Third-Party Service. Honeywell will tailor a service program to meet your requirements. You can select from a wide variety of service options. With more than 250 service locations around the country, we're well able to look after your customers' satisfaction.

If your business is growing faster than your ability to provide quality service, or if you're not satisfied with your current service alternatives, call Honeywell.

A quality approach to service.

We'll give you the benefit of more than 25 years' experience providing first class service. Flexible service. Nationwide. At a price you'll find very reasonable.

For more information on how Honeywell can help you better serve your customers, call:

Figure 6. The IPP program, 1980

but involved little theory.

Politics. Once we built a program that used plans to understand stories, we opened up a set of new problems. For example, once we create a plan, someone else can come up with a counterplan. When we read stories, we aren't just aware of plans; we can recognize counterplans and counter-counterplans. With this in mind, we wrote Politics (we never did think up an acronym for this one), a model of a U.S. senator's position on foreign policy questions, complete with separate belief systems that held the beliefs of a conservative and those of a liberal. Politics was intended to sound like a U.S. senator by reflecting some of the reasoning processes that a senator might use in answering questions that were asked of him (see Figure 4 on ID/10).

Politics was written by Jaime Carbonell as part of his Ph.D. thesis at Yale. It differed from our other programs in that it was an integrated system. Rather than have a separate parser as we had done before, Politics used its knowledge of the situation to help it understand sentences.

Politics demonstrated that one must interpret any new item of information using all the mental processes available. Beliefs, inferences, plans, goals, scripts, prior memories — all were relevant to the understanding of international events. In Politics, they all were there in one place.

Frump. Success in these programs led us to begin to attack our old problems in different ways. First, we tried to speed up what we had done already. Next, we tried to integrate fully all the processes we knew about into one grand story understanding system. Sam had been slow; it made inferences for every single aspect of a script-based story as it read through, and it took the computer a very long time to process each story. Although we believed that the processes Sam went through were part of language understanding, not all those processes were used all the time.

We decided to work on turning off some of Sam's processes at appropriate times. Another problem with Sam was that it was modular. It first put a sentence through a parser, then through the inferencer, script applier and generator. But real human understanding is more likely to be integrated. We start parsing, making inferences and generally interpreting a sentence even before we have heard the end of it. We do not wait to see how a sentence will turn out before we begin to understand it.

We decided to integrate everything and speed everything up by not wasting time on spurious inferencing. We wrote Frump (Fast Reading, Understanding and Memory Program). We hooked this program up to the United Press International news wire, and the program zipped through it, summarizing the stories that it understood in several languages (see Figure 5 on ID/10).

Frump was written by Jerry De Jong as part of his Ph.D. thesis at Yale. Frump was a complex program, and Jerry had many assistants to help build various parts of the program. These included Kris Hammond, Jim Hendler and Bill Ferguson. Frump was our first attempt to build a product-directed program. We wanted to see how hard it would be to make the story-understanding process fast. As a result, we sacrificed careful understanding for speed. Nevertheless, theoretical advances did come from Frump, the most notable being the fusing of the parsing and inference processes into one basic process.

Frump worked so well that people were calling up to ask us to create a program that could read and keep track of massive texts such as the Congressional Record and to build systems that could analyze foreign publications. We had to point out that Frump only contained a few scripts to read restricted kinds of new stories and that any kind of general understanding system would require thousands of scripts.

IPP. We next wrote a program called IPP (Integrated Partial Parser). IPP was essentially like Frump except that it had detailed

Teach your word processor to read.

Whether you have a CPT, Exxon, IBM, Lanier, NBI, Wang or Xerox, we can make it smarter. The compact Dest WorkLess Station™ lets you enter typewritten pages of different typestyles into your word processor automatically, without using the keyboard.

PROCESSING PARAGRAPH 1:

        Richard hadn't heard from his college
        roommate Paul for years.
        Richard had borrowed money from
        Paul which was never paid back.
        But now he had no idea where to find
        his old friend.
        When a letter finally arrived from San
        Francisco, Richard was anxious to find
        out how Paul was.

READY TO ACCEPT Q/A:

        >What happened to Richard at
        home?<
        RICHARD GOT A LETTER FROM PAUL.

        >Who is Paul?<
        RICHARD'S FRIEND.

        >Did Richard want to see Paul?<
        YES, RICHARD WANTED TO KNOW
        HOW PAUL WAS.

        >Had Paul helped Richard?<
        YES, PAUL LENT MONEY TO RICH-
        ARD.

        >Why didn't Richard pay Paul
        back?<
        RICHARD DID NOT KNOW WHERE
        PAUL WAS.

        >How did Richard feel when the let-
        ter appeared?<
        RICHARD FELT GLAD BECAUSE PAUL
        AND HE WERE FRIENDS.

PROCESSING PARAGRAPH 2:

        Unfortunately, the news was not
        good.
        Paul's wife Sarah wanted a divorce.
        She also wanted the car, the house,
        the children, and alimony.
        Paul wanted a divorce, but he didn't
        want to see Sarah walk off with every-
        thing he had.
        His salary from the state school sys-
        tem was very small.
        Not knowing who to turn to, he was
        hoping for a favor from the only lawyer
        he knew.
        Paul gave his home phone number in
        case Richard felt he could help.

READY TO ACCEPT Q/A:

        >What was the letter about?<
        PAUL AND SARAH WERE GETTING A
        DIVORCE.

        >Did Paul write Sarah?<
        NO, IT WASN'T SARAH, IT WAS RICH-
        ARD WHO GOT THE LETTER.

        >Why was Paul upset about the di-
        vorce?<
        PAUL AND SARAH WERE FIGHTING
        OVER THE FAMILY POSSESSIONS.

        >What did Paul do for a living?<
        PAUL WAS A TEACHER.

        >What did Sarah want?<
        SARAH WANTED TO HAVE THE CAR
        AND THE HOUSE AND THE KIDS AND
        THE ALIMONY.

        >Why did Paul write,to Richard?<
        PAUL WANTED RICHARD TO BE HIS
        LAWYER.

        >go<

PROCESSING PARAGRAPH 3:

        Richard eagerly picked up the phone
        and dialed.
        After a brief conversation, Paul agreed
        to have lunch with him the next day.
        He sounded extremely relieved and
        grateful.

READY TO ACCEPT Q/A:

        >Why did Richard call Paul?<
        RICHARD WANTED TO ARRANGE A
        MEETING WITH PAUL.

        >Did Richard contact Paul?<
        >How did Richard contact Paul?<
        BY PHONE.

        >How did Paul feel when Richard
        called?<
        PAUL WAS HAPPY BECAUSE RICH-
        ARD AGREED TO BE PAUL'S LAWYER.

        >go<

PROCESSING PARAGRAPH 4:

        The next day, as Richard was driving
        into the restaurant, he barely avoided
        hitting an old man on the street.
        He felt extremely upset by the inci-
        dent, and had three drinks at the res-
        taurant.
        When Paul arrived Richard was fairly
        drunk.
        After the food came, Richard spilled a
        cup of coffee on Paul.
        Paul seemed very annoyed by this so
        Richard offered to drive him home for
        a change of clothes.

READY TO ACCEPT Q/A:

        >Why did Richard eat out with
        Paul?<
        RICHARD WANTED TO DISCUSS THE
        DIVORCE CASE WITH PAUL.

        >What happened to Richard on the
        way to the restaurant?<
        RICHARD ALMOST RAN OVER AN OLD
        MAN.

        >Why did Richard get drunk?<
        RICHARD WAS UPSET ABOUT AL-
        MOST RUNNING OVER THE OLD MAN.

        >What happened at the restau-
        rant?<
        RICHARD SPILLED COFFEE ON PAUL.

        >How did Richard feel when the cof-
        fee spilled?<
        RICHARD WAS UNHAPPY.

        >Why did Richard spill the coffee?<
        RICHARD WAS DRUNK.

        >When did Richard almost hit the old
        man?<
        WHILE RICHARD WAS DRIVING TO
        THE RESTAURANT.

        >Where did Richard have lunch with
        Paul?<
        AT A RESTAURANT.

PROCESSING PARAGRAPH 5:

        When Paul walked into the bedroom
        and found Sarah with another man he
        nearly had a heart attack.
        Then he realized what a blessing it
        was.
        With Richard there as a witness, Sa-
        rah's divorce case was shot.
        Richard congratulated Paul and sug-
        gested that they celebrate at dinner.
        Paul was eager to comply.

READY TO ACCEPT Q/A:

        >Why did Richard drive Paul
        home?<
        SO PAUL COULD CHANGE HIS
        CLOTHES.

        >What happened to Paul at home?<
        PAUL CAUGHT SARAH COMMITTING
        ADULTERY,

        >How did Paul feel?<
        PAUL WAS SURPRISED.

        >Why did Sarah lose her divorce
        case?<
        SARAH COMMITTED ADULTERY.

        >Why did Richard congratulate
        Paul?<
        PAUL WON HIS DIVORCE CASE.

        >go<

Electronic Spread Sheet
For VM/CMS & MVS/TSO
The Best Mainframe Spreadsheet

Powerful - Spreadsheet size is limited only by available virtual storage. ESS easily handles spreadsheets with thousands of rows and/or columns.

Proven - Thousands of satisfied users worldwide at large and small installations, including many Fortune 500 corporations.

Compatible - ESS accepts the same commands as VisiCorp's VisiCalc® program for microcomputers. A person familiar with VisiCalc® can be using ESS productively in minutes. In addition, ESS can load and save files in VisiCalc® format.

High Performance - Assembler language code and sophisticated storage management techniques give you fast response, even with very large spreadsheets.

Easy to Install - Just load the ESS program. No additional program products or languages are required.

Cost Effective - ESS gives all your users access to personal computing capabilities for just $220 per month. Compare that to the cost of buying hundreds of microcomputers.

Questions? - For more information about ESS, or to arrange a 30-day free trial, call or write TRAX.

COMPUTER AUCTION
AS THE FOLLOWING EQUIPMENT IS SURPLUS TO THE FUTURE NEEDS OF THE SMITH ANDERSON CORPORATION, THE BOARD OF DIRECTORS HAS ORDERED IT SOLD TO THE HIGHEST BIDDERS AT PUBLIC AUCTION.

NCR MULTI-USER
MINICOMPUTER SYSTEMS
FRIDAY • NOVEMBER 30th • 10:00 A.M.
SMITH ANDERSON CORPORATION HEADQUARTERS
[illegible] HIGHWAY 111 • RANCHO MIRAGE, CALIFORNIA
(From Los Angeles/Riverside area, take Interstate 10 to Highway 111 through Palm Springs. Auction site is on the left, two miles past Frank Sinatra Drive. Look for auction signs.)

65 NCR
INTERACTIVE SYSTEMS
8230's, 8251's 8271's, 9010's, 9020's, 8410's with memory from 96KB to 512KB for 3 to 18 users. (COBOL or BASIC)

60 NCR
PRINTERS
290's, 340's 646's 649's, 2584's, 6420's, 6440's (CPI/CT1A9-C03), 6441's, with speeds from 30CPS to 1200LPM.

175 NCR DISC DRIVES
656's (CDC#9427), 6530's (CDC#9448), 6540's (CDCDZ9N7), 6560's, 6566's (CDC#9414), 7642's, 7644's with capacity from 1MB to 135MB.

80 NCR INTERACTIVE TERMINALS
280's, 796's, 7900's portables, detached keyboards, auto send/receive.

NO MINIMUM BIDS! NO RESERVES!

LARGE SELECTION OF
TERMINALS • MONITORS • KEYBOARDS • READERS
IBM MODEL 75 TYPEWRITER - 16K MEMORY • SAVIN MODEL 795 PLAIN PAPER COPIER • EXECUTIVE & SECRETARIAL WOOD DESKS

TERMS AND CONDITIONS:
MOST UNITS ELIGIBLE FOR NCR MAINTENANCE COVERAGE. ALL ITEMS SELL TO THE HIGHEST BIDDERS FOR CASH, OR COMPANY CHECK, IN FULL, THE SAME DAY OF THE SALE. SHIPPING SERVICES AVAILABLE AT THE SALE SITE. FREE CATALOG AT THE DOOR.

PREVIEW: WEDNESDAY & THURSDAY • NOV. 28th & 29th
FROM 8:00 A.M. TO 5:00 P.M.
FOR ADDITIONAL INFORMATION PLEASE CALL [illegible]

Figure 8. The Cyrus program

knowledge of one domain — terrorism — and it could add to that knowledge by absorbing information from what it read into its memory.

We were attempting to address two different problems in IPP. First, if we ever are to automate the reading of news wires, we will have to build in detailed knowledge of the subject matter to be read. IPP concentrated on only one domain of knowledge so that it could attempt to build-up its knowledge in that domain. Our goal was to get IPP to build up that knowledge automatically, by learning from what it read. The second goal in IPP was to put all the knowledge structures we had devised into the same program. Frump used only scripts. IPP used plans, goals and scripts and also had a memory.

IPP was written by Michael Lebowitz as part of his Ph.D. thesis at Yale. The major intention of IPP was to add to its knowledge structures by forming new structures as a result of what it read. The program made a new generalization about Basque terrorist attacks, which it constructed for itself after reading the following three stories. Often the generalizations IPP made were a bit spurious. Nevertheless, it was beginning to update and expand its own memory structures, and that was of critical importance.

Boris. After spending a fair amount of effort on news stories, we began to be concerned that there was a range of phenomena in understanding that did not come across on the news wire but nevertheless posed significant problems. We wanted also to see how we could improve our general story understanding capabilities by using a new set of memory structures we were devising, ones more suited to facilitate learning by cross-contextual understanding.

We created a more fully integrated program that relied on a model of human beliefs and interactions that we could use in understanding little melodramas. This program was called Boris. (We were feeling a bit whimsical in naming this one. In fact, we named it long before we wrote it. The name expresses our frustration with some of our previous programs: Better Organized Reasoning and Inference System.)

As our lab grew, we started to add new faculty and projects, which often were not run directly by me. The Boris project was supervised by Wendy Lehnert, who by this time was a professor at Yale. Boris was written by Michael Dyer as part of his Ph.D. thesis. Tom Wolf and Pete Johnson also worked on the project. Boris was a rather complicated program that employed new parsing techniques, new inference techniques and used different memory structures from those we had been using (see Figure 7 on ID/15).

The language understanding programs we had built so far were satisfying in that they showed us we

PROTOCOL CONVERSION
Expand your 3270 network with low cost ASCII devices!

Now you can integrate personal computers and low cost ASCII devices directly into your IBM 3270 network. With our protocol converters you can add on low cost ASCII peripherals either by using Type A coax attachment or by 3274/3276 controller emulation. Innovative delivers flexibility, simplicity and competitive prices with our family of 3270 products.

Call us today toll free ([illegible]-327-[illegible]), and find out how you can expend your 3270 network easily and inexpensively. Prices starting at just [illegible].

COAXIAL CONNECTION
- IBM 3270 Type A Coax plug-in card for IBM PC or XT
- IBM 3270 Type A Coax to ASCII Printers.
- IBM 3270 Type A Coax to ASCII CRT/Host

3274/76 EMULATION
- IBM 3270 SNA/BSC to (5-24) ASCII Devices
- IBM 3270 BSC to Burroughs/NCR Devices
- IBM 3270 BSC to ASCII Devices/Host (low cost - 3 ports)
- IBM 3270 SNA to NCR/Burroughs Devices

*Additional Protocol Conversions available.

equal.

Ours add more value to your system.

Computer terminals may look alike. But some are far more equal to their tasks than others.

After just a short time on the job, many cut-rate terminals could cost you in ways you never bargained for. In downtime. Expensive repairs. And worst of all, breakdowns in communication between expensive computers and expensive people.

So when adding terminals to your system —or designing a new one—it's smart business to shop for quality as well as cost. When you do, you'll find that one terminal company lets you have lower prices, without having to lower your expectations: Qume Corporation.

Value that stands the test of time.

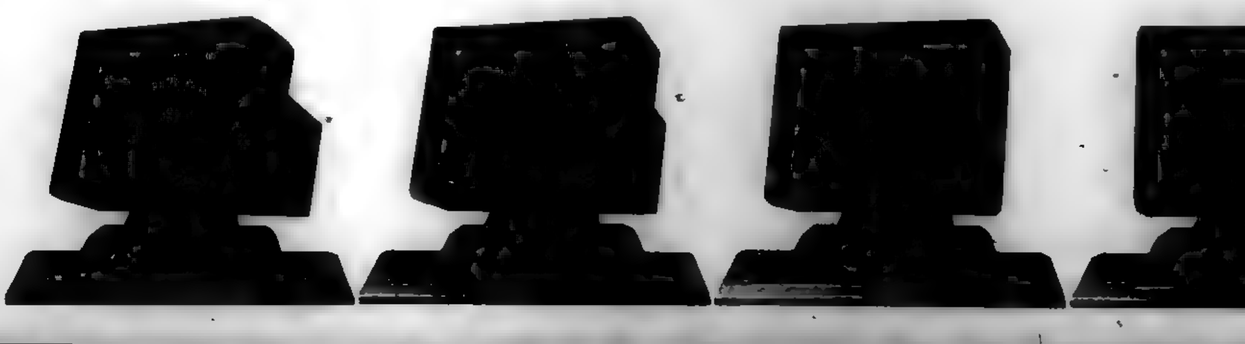
We solve reliability issues in the design stage, so you won't have to later on. Our QVT™ terminals give your system a performance edge that won't fade after the first few months.

You get added peace of mind from the day of delivery, with a full one-year end-user warranty. Though that's *double* the warranty of most other terminals, over 98% of our customers never need it. Qume quality control is *that* good.

Considering our affordable prices, it's an even more remarkable achievement.

High performance for less.

With Qume, you don't have to pay more for advanced, productivity-enhancing features. Our alphanumeric terminals deliver all the power and flexibility of more costly VDTs. Our affordable new graphics terminals let you perform the same magic as



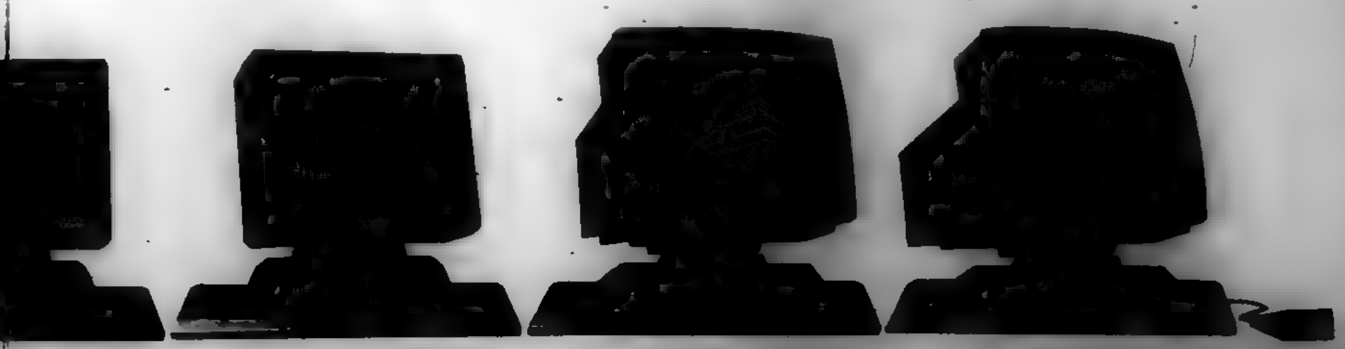
very expensive models…plus some impressive new tricks of our own. And all Qume terminals feature the latest ergonomic conveniences—compact, space-saving design, detached low-profile keyboards, and full tilt-and-swivel screen displays. You won't find more people-pleasing terminals at any price.

Superb nationwide service.
Even the world's most dependable terminals might eventually require maintenance. So we back you up with reliable third-party service as well as our own Qume repair depots. Wherever you are and whichever service option you choose, you can depend on prompt, expert nationwide support.

Rock-solid business credentials.
Qume is an ITT company. There are over 60 years of resources and experience behind our commitment to deliver today's best terminal values, premier service, and excellent technical support. And just as important, we have the staying power to be there with all the right solutions in the years ahead, as your needs grow and evolve.

Whatever your needs and applications, you can trust Qume terminals to work harder for you today…and equally hard tomorrow.

Qume.
A Subsidiary of ITT



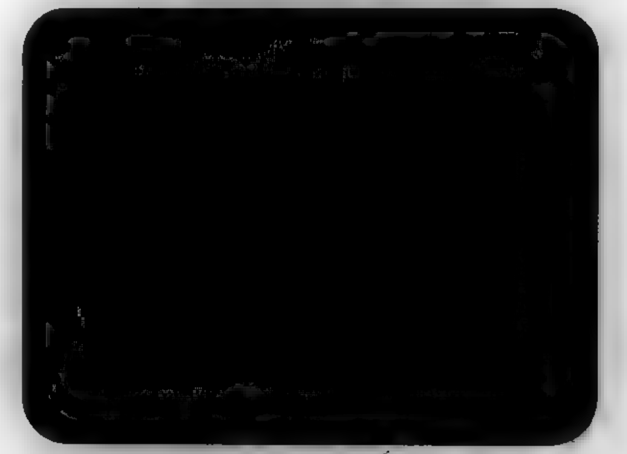
Editing terminals you can be twice as sure of.

With Qume's full one-year warranty, you get twice the protection of most other editing terminals. And you can be equally sure of a perfect fit with both your applications and your people.

Qume QVT editing terminals are designed to satisfy a broad range of everyday business needs, including word processing, spreadsheet functions for accounting and general ledger, and database activities such as order entry, data entry/retrieval, and inventory control.

While many terminal manufacturers claim overall compatibility with a wide assortment of terminals, the fit is often less than exact...which means big on-the-job problems for operators and host systems alike. But Qume terminals go much further, with full and complete *emulation* of ten of the most popular terminals in the field.

All four QVT terminals come with a host of operator conveniences and productivity-enhancing ergonomics, as detailed in the inset box below. And what's more, each has been custom-tailored to a specific set of technical requirements.



QVT-102. The add-on terminal that adds more value.

Our low-cost, high-performance QVT 102 is the best way to expand your current system. It emulates the Hazeltine 1500, Lear Siegler ADM 3A/5 and TeleVideo 910 at a keystroke, so your operators will find it a perfect fit right from the start. But best of all, it provides a system upgrade at no extra cost, with sophisticated features like local editing, block *and* conversational transmission modes, and the many enhancements and ergonomic advantages listed below.

QVT-103.
The ideal alternative for ANSI and UNIX environments.

Our QVT 103™ is not just another DEC-compatible terminal. It provides the most complete VT 131 and VT 100 emulations you can obtain. And it outperforms other VT 100 look-alikes with more powerful editing features like block and conversational transmission modes, a switchable 80- or 132-column screen format, two pages of screen memory (expandable to four), and 12 user-programmable functions. The standard 14-inch screen—and Qume's optimal ergonomic design—give this terminal the clear edge for operator comfort and convenience. So when your ANSI needs are multiplying, you need look no further than Qume's QVT 103.

QVT-108.
Exceptional power for executive workstations.

Packed with power and versatility, the QVT 108™ is more than equal to the most demanding management-level tasks. It provides full emulation of the TeleVideo 925, 920 and 912, and out-smarts them all with 22 user-programmable functions, 12 editing functions, two pages of screen memory, and many other standard features. There's even a built-in clock. Add in Qume's advanced ergonomics and a very affordable price, and the QVT 108 is an unbeatable choice.

QVT-109.
Made to order for OEMs and systems integrators.

This is the terminal of choice for anyone in the business of systems design. Our new QVT 109™ provides all the most-wanted editing features, for complete applications flexibility—19 user-programmable function keys (38 functions). Six non-imbedded character attributes. A truly buffered auxiliary port for data transmission at a different baud rate from the main port. And a rugged and responsive capacitive keyboard. There are a host of other utilities and options, plus the superior ergonomic design of all Qume terminals. Whatever specs you're designing to, you'll find the QVT 109 to be the best, most rewarding solution.

All Qume editing terminals come with the following features and conveniences:

- 14″ screen in green or amber with full tilt and swivel
- Detached, low-profile, adjustable-tilt keyboard
- Bidirectional auxiliary port
- Menu set-up mode
- 25th status line
- Screen-saver time-out (defeatable)
- Baud rates: 16 selections from 50 to 19.2K
- Options: amber phosphor screen, foreign character keyboards, 20 mA current loop

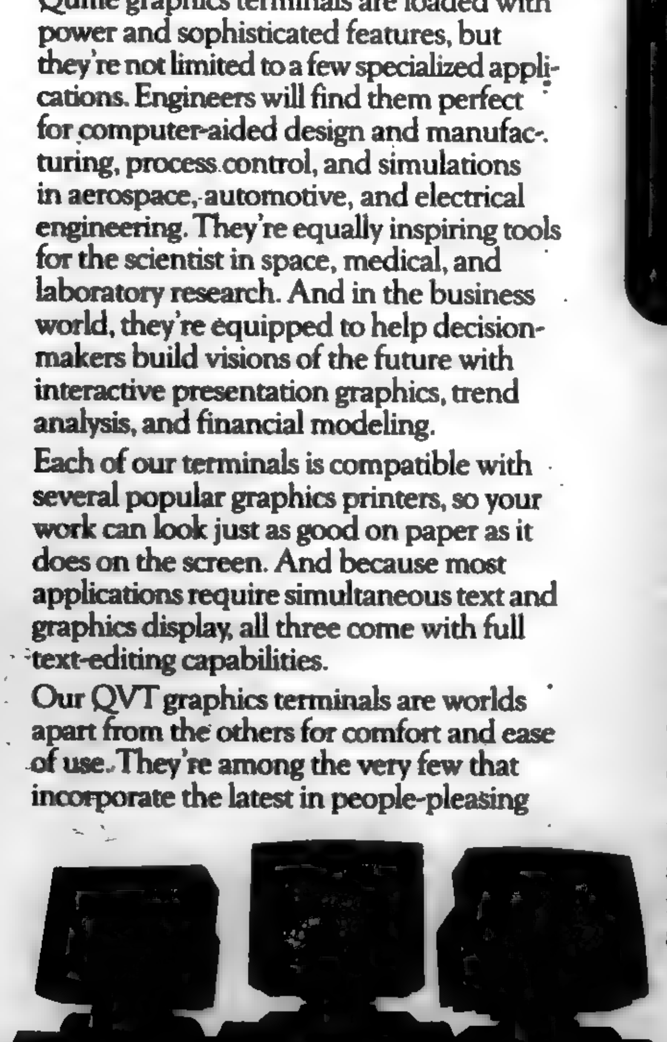
Graphics terminals with more magic for the money.

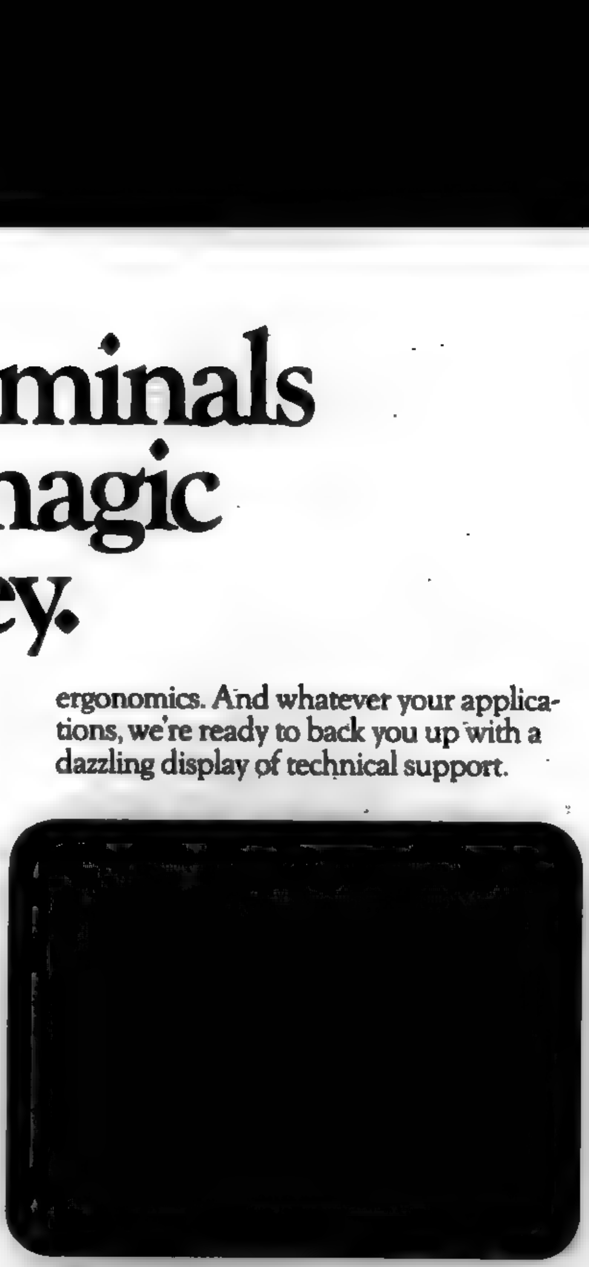
Whatever your line of work, computer graphics can help you shape your ideas more powerfully and productively. Such wizardry used to be out of reach for most professionals, but now Qume brings you the magic of black-and-white and full-color graphics ...at much less cost than ever before.

Qume graphics terminals are loaded with power and sophisticated features, but they're not limited to a few specialized applications. Engineers will find them perfect for computer-aided design and manufacturing, process control, and simulations in aerospace, automotive, and electrical engineering. They're equally inspiring tools for the scientist in space, medical, and laboratory research. And in the business world, they're equipped to help decision-makers build visions of the future with interactive presentation graphics, trend analysis, and financial modeling.

Each of our terminals is compatible with several popular graphics printers, so your work can look just as good on paper as it does on the screen. And because most applications require simultaneous text and graphics display, all three come with full text-editing capabilities.

Our QVT graphics terminals are worlds apart from the others for comfort and ease of use. They're among the very few that incorporate the latest in people-pleasing ergonomics. And whatever your applications, we're ready to back you up with a dazzling display of technical support.





QVT-211GX.
Powerful vector graphics for surprisingly low cost.

The QVT 211GX™ puts a powerful array of graphics within easy reach of micro, mini and mainframe users. Our advanced vector graphics let you draw conclusions quickly and easily—arcs, circles, boxes and fill can be generated with single commands. So you can whiz through graphics programming with just a few keystrokes.

The QVT 211GX comes with all the text-editing features—and the ergonomic design—of our QVT 102 alphanumeric terminal. It's compatible with the Tektronix 4010 and 4014 command sets, which makes it ideal as a preview terminal for CAD/CAM and PLOT 10 applications.

Hazeltine 1500 is a registered trademark of Hazeltine Corporation. Lear Siegler ADM 3A/5 is a registered trademark of Lear Siegler, Incorporated. TeleVideo and TeleVideo 910, 912, 920 and 925 are registered trademarks of TeleVideo Systems, Incorporated. DEC, Digital VT 100, VT 125, VT 131, LA 50 and ReGIS are registered trademarks of Digital Equipment Corporation. FX 80 and MX 80 are registered trademarks of Epson Corporation. Hewlett-Packard 7470A is a registered trademark of Hewlett-Packard Company. Tektronix 4010, 4014, 4105, 4110, 4695 and PLOT 10 are registered trademarks of Tektronix, Incorporated. ANSI is designed to American National Standards Institute, Inc. ANSI X3.64-1979 guidelines. ISO is designed to International Standards Organization ISO 6429 guidelines. Images courtesy of Precision Visuals Inc. and SAS Institute Inc.

QVT-311GX.
The shortest distance between PLOT 10 and ReGIS.

Qume's new QVT 311GX™ monochrome graphics terminal provides full compatibility with both Digital's VT 125 and Tektronix' 4010/4014 series, at a price substantially lower than either! It's the first terminal that gives you the mobility to draw on an entire universe of graphics software—both PLOT 10 *and* ReGIS—plus full ANSI text-editing capabilities. It provides full bit-mapped graphics on a 14" non-glare white snow phosphor screen, with a resolution of 640 x 480 pixels. Two graphics planes allow for the production of four shades of gray. And there's an optional mouse for complete flexibility in graphics editing.

All Qume ergonomic features are standard on the QVT 311GX, including a 14-inch screen and a responsive, long-lasting capacitive keyboard.

QVT-511GX.
Now anyone can afford the brilliance of color.

When you're ready for the beauty and precision of color graphics, our new QVT 511GX™ terminal is the ideal choice. At a cost you may find hard to believe, it provides flicker-free, non-interlaced raster scan graphics (screen resolution of 480 x 360 pixels) with a selection of up to eight colors from a palette of 64. It's fully compatible with the Tektronix 4105 and accepts all of its software, including PLOT 10 packages. The QVT 511GX can also be used in Tektronix 4010, 4100, and 4110 series environments, and works beautifully with the Tektronix 4695 color graphics copier. What's more, it conforms to both ANSI X3.64 and ISO 6429 protocols for text editing. A mouse device and capacitive keyboard are standard equipment on the QVT 511GX.

All Qume QVT graphics terminals come with superior ergonomics: compact, space-saving design; detached, low-profile keyboards; and 14-inch screens with full tilt-and-swivel. Plus the following features:

QVT 211GX	
Max. Addressable Memory:	4096 x 4096 points
Display Resolution:	644 x 288 points
Graphics Printer Compatibility:	Epson FX 80 and MX 80 Hewlett-Packard 7470A
QVT 311GX

could do what we set out to do. But they also were frustrating because each showed us a new set of problems that were unsolved and lay as obstacles on the road to automating the understanding process. These programs became more and more complicated to write as they encompassed ever more processes and greater and greater knowledge.

Cyrus. Perhaps the program we have written that best illustrates just where we are going is Cyrus. Cyrus stands for Computerized Yale Reasoning and Understanding System. (In this case, we knew the name had to be Cyrus; it was just a question of figuring out what Cyrus could be an acronym for.) Cyrus was a memory program that received from Frump all the stories it could find about Cyrus Vance, who was Secretary of State at the time. (The program later switched to Muskie.)

Cyrus compiled a professional and personal history of Cyrus Vance. This was an attempt to begin to model the memory of a particular individual. In some sense, the program thought of itself as Cyrus Vance.

Cyrus compiled a professional and personal history of Cyrus Vance. This was an attempt to begin to model the memory of a particular individual. In some sense, the program thought of itself as Cyrus Vance. (Well, we wrote it that way. It is hard to say that this program thought anything about itself.) We wanted the program to change constantly on the basis of its new experiences. It succeeded to some degree, but its success is not quite the point.

In a sense, Cyrus — or programs that will succeed Cyrus — will replace the large data base programs we have today. The problem with today's data bases is that they don't know what they know. Cyrus reorganized itself continually to reflect best what it knew.

And, although it was only an experiment, it taught us a great deal about what it means to remember.

Cyrus was written by Jane Kolodner as part of her Ph.D. thesis at Yale. Perhaps Cyrus' most interesting highlight was its ability to answer questions about which it had no direct information. When Cyrus responded that Mrs. Begin had met Mrs. Vance (see Figure 8 on ID/16), the program actually was just guessing. It figured that if it could find a situation when both women were likely to be present, then it could assume that they had met. The program thus searched for social situations (to which wives might have been invited) that occurred on trips that either one of the men might have made with his wife to the home of the other.

Finding a state dinner in Israel that occurred during a trip on which Mrs. Vance did accompany her husband, it assumed the rest.

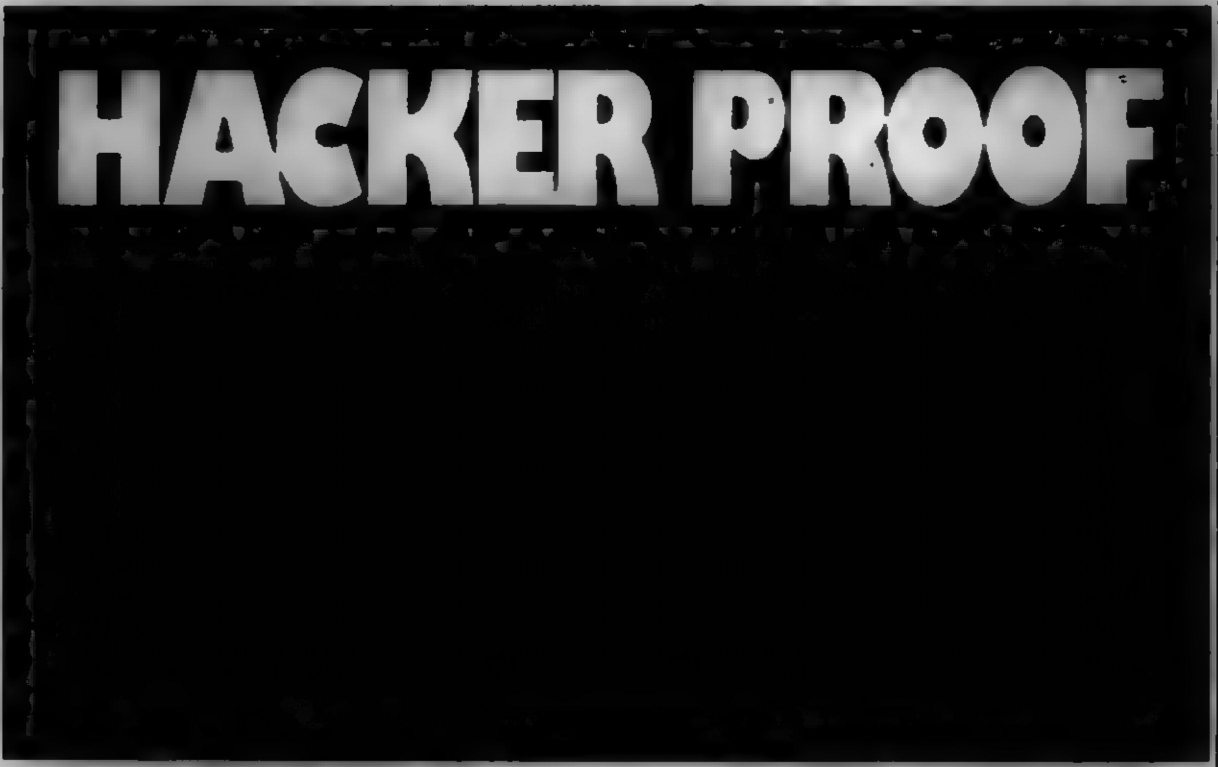
The problem with today's data bases is that they don't know what they know.

The road ahead

On a crude level, both Cyrus and IPP could be reminded of a previous story and compare the two in search of some general characteristics. For example, IPP researched some generalizations on its own derived from what it read. The program decided that every terrorist attack in Ireland was by the IRA; in every terrorist attack in New Zealand, the weapon was a boomerang; and that every time there was a hijacking in Lebanon, it was in protest of the disappearance of a Shiite Moslem leader.

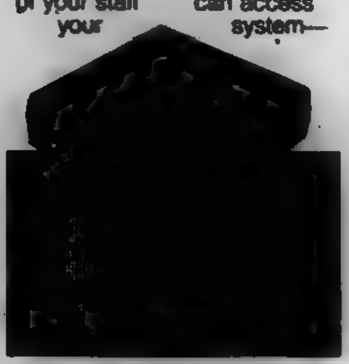
But more and more, we came to realize that scripts, plans, goals and cross-textual referencing weren't the only crucial elements of an understanding system. Understanding a story can involve everything a person has ever known. We began to realize the importance of a dynamic memory, one that changes every time it understands a story.

A dynamic memory program would be able to find experiences



Have SECURE dial access to ANY computer using NO passwords and NO dialback with DATA LOCK & KEY™

Simply connect a **DATA LOCK** (shown above) between your mainframe and your modems. Issue the portable **DATA KEYS** (shown below) to all authorized personnel. Only these members of your staff can access your system—



from any telephone—and they need no passwords! They simply dial in, and are connected.

NO PASSWORDS?

Only a **DATA KEY** can provide correct responses to the large random numbers sent by the **DATA LOCK.** Thus the LOCK quickly identifies authorized users, and allows them to access the mainframe. Because the numbers are random, the dialogue between **LOCK** and **KEY** is different every time a user dials in.

Access is not dependent on passwords remembered, forgotten or passed along, so it is faster and more secure.

HACKERS, BEWARE.

DATA LOCK is ever-vigilant. Every unauthorized access attempt is immediately **detected, thwarted, displayed, printed and remembered.** Simultaneously, computer room personnel are alerted by a piercing alarm.

AUDITORS, REJOICE!

Just connect a printer to a **DATA LOCK** to obtain a comprehensive audit trail, which includes the following information:

- Date, time and details of all calls handled.
- Statistics of line usage.
- Unauthorized **DATA KEYS** (i.e. lost or stolen **KEYS**).

SPECIFICATIONS

DATA LOCK & KEY™ works with all computers and modems with RS232 connections. The system is compatible with async, Bisync, SNA/SDLC and all other protocols. No adjustments are necessary for protocol, baud rate, modem type, etc. Protocols and mainframes of different types can be simultaneously supported by one **DATA LOCK.**

LINES SUPPORTED:
DATA LOCK—4
DATA KEY—1

DATA KEYS supported by a DATA LOCK: any number.

PRICE: DATA LOCK—$4,000
DATA KEY—$400

Microframe Inc.

New Brunswick, NJ 08901
(201) 828-4499

MEDICAID MANAGEMENT INFORMATION SYSTEM REQUEST FOR PROPOSAL

The West Virginia Department of Human Services intends to issue a Request for Proposal (RFP) on or about November 27, 1984, for the procurement of a federally certifiable Medicaid Management Information System (MMIS) and associated facilities management services. The Department of Human Services plans to initiate the contract resulting from the RFP on or about April 2, 1985. Any contractor wishing to compete for this contract should send a letter of intent to bid. This letter should be received at the following address by November 28, 1984:

Finance and Administration
State Purchasing Division
Capitol Station - Room E119
Post Office Box [illegible]
Charleston, West Virginia 25311

Attention: Kathy Kline, Senior Buyer

NOTE: With a copy of the letter to:

Mr. Edward L. Henderson
Administrative Assistant
Division of Medical Care
West Virginia Department
of Human Services
1900 Washington Street East
Charleston, West Virginia 25305

The letter of intent should state that the vendor can install a fully tested and fully operational MMIS by January 1, 1986, and provide a summary of the vendor's prior experience and general qualifications.

The IBM Instructional Systems

Now you can have a comprehensive training system with IBM host and PC compatibility.

Computer-Based Training (CBT) can be cost-effective, convenient and adaptable to the pace at which your students learn. And by helping to improve your employees' skills, CBT can also improve your profitability.

Now IBM offers you training software with the features you've been waiting for.

Compatible IBM Personal Computer-based and host-based systems.

Tailor your CBT system for either a centralized or stand-alone environment. IBM's new Personal Computer Instructional System (PCIS)* works with our host-based Interactive Instructional Systems. So courses written on the IBM PC can be presented on host terminals—and vice versa—giving the flexibility you need for quality training.

Powerful authoring systems.

These systems let your course creators use authoring "levels" according to their experience, so they can be more productive. Menus, hints, quizzes and graphics can be included for better interest and clarity.

Advanced functions for better student performance.

Features like pretests and student branching let your system adapt to students' abilities. And you can create simulations to let students practice realistic situations.

Also, the administration systems for the PC and host computer let you easily monitor the quality of training, use of the system and progress of each student.

A growing list of courseware.

Whether you're just starting or expanding your system, you can choose from a variety of prepackaged courseware available from IBM or other vendors.

Profit from IBM experience and support.

You can depend on IBM for quality support. After all, we've been providing instructional systems for over 20 years.

You can order or learn more about IBM Instructional Systems by calling 1 800 IBM-2468, Ext. 90, and asking for the Software Department. Or return the coupon.

*Developed for IBM by Computer Systems Research, Inc.

> *We are trying to develop a system that is capable of building up an increasing number of memories about different situations it has experienced, which it then can use in understanding even more stories and experiences.*

from its past to help it understand a new event. A program equipped with such a memory would read a story differently each time it saw it, since it would be updating memory the first time, but be bored the second time. Or, it might learn more from it the second time, if it had gathered many new experiences that related to the subject of that story in the interim.

Our early programs never changed their processing structures as a result of reading a new story. They served to lead us into what may be the most complicated elements of any understanding system — the memory problem and the learning problem. Cyrus and IPP were our first attempts at getting programs to learn.

We are now trying to develop a system that is capable of building up an increasing number of memories about different situations it has experienced, which it then can use in understanding even more stories and experiences. We don't all have the same knowledge of earthquakes or even of driving a car, because we don't all have the same experiences with earthquakes and cars. We don't just want to have to put in everything we have ever known about earthquakes; we want to enable the machine to generate its own knowledge of them derived from its experiences.

Reading a story should change the way we read a later story on the same subject. Creating a belief system with some knowledge structures about what humans might do in certain situations depends upon the development of good representational methods. Getting a system that can use all its beliefs at any given time and modify them on the basis of what it reads, one that can learn from its experiences, requires an even more flexible representation than the kind we had been using.

How do people expand their knowledge so that it helps them with everything, so that it changes the way they parse sentences? Children constantly dream up generalizations, see when they fail and modify them on the basis of their experiences. Intelligent readers learn from what they read — that is why they read.

It is clear, then, what we must do next. We must develop systems with flexible, changeable structures that can learn while doing.‡

About the author

Roger Schank is professor of computer science and psychology at Yale University, chairman of the computer science department and director of the Yale Artificial Intelligence Project. He is also chairman of the board of Cognitive Systems, Inc., in New Haven, Conn.

Peter Childers is a recent graduate of Yale University.

From J.D. Edwards & Company, the industry specialist for IBM System/36 and System/38 computers, comes award-winning software.

Paperless Processing

Put paper in its place by reviewing error reports, batch controls and daily journals on-line. Print general ledger reports just once a year or produce most traditional reports as frequently as needed.
Now the choice is yours.

Date-Insensitive Processing

Escape the confines of the calendar. Now monthly closings can be eliminated and annual closings run several times, even months apart. Or have two years and several months open concurrently, if it benefits your business. User convenience determines closing cycles with this elegant software.

User-Defined Vocabulary

Tailor the terms to fit your business culture. A comprehensive 4800-term data dictionary can be modified as needed for clearer communication. Even language changes are easily accommodated.

A Paragon of Technology

Data dictionary driven...100% soft coded...normalized database... clone generated...superbly documented...with impeccable code. This sophisticated software is easily modified and notably advanced.

PROGRAMMING IN DECISION TABLES

is a comprehensive and informative book, written in a crisp and clear style, with many examples and illustrations.'

The programming language in the examples is COBOL. The methods described are well-tried, and easy to use.

Decision table programs can be tested with great thoroughness, are exceptionally reliable, and require much less maintenance effort than other programs.

This excellent book takes a completely new approach to the use of decision tables in programming.

The pursuit of data integration

Marketing sells one product, manufacturing makes another, engineering adds changes, and accounting tries futilely to balance it all on the books. Therein lies the need for data integration.

By Thomas Womeldorff

Integration takes on almost as many definitions as there are vendors claiming to provide it. True integration between all operating systems is, in fact, one of the primary ways in which organizations are beginning to move forward in pursuit of a competitive edge.

So what constitutes true integration among application systems? At the highest level, integration is simple. It means that a software mechanism ties together all of an organization's support systems in a way that mirrors the way the organization actually does business. Furthermore, that mechanism is capable of evolving with the organization as its business requirements change.

From a functional level, integration must be understood as multidimensional. Truly integrated systems provide data integration, transactional integration and operational integration.

Data integration provides a company with a common set of facts. All information about related business activities is stored in a common repository and updated as events affecting that data occur. Marketing, manufacturing, engineering and accounting all use the

Events occurring in one system must update the data base and communicate those changes to other systems or users who, in turn, will use the data to plan or replan their business activities.

same data to make decisions about their particular role in selling, manufacturing, designing or costing any given product.

Traditionally, each operating group had its own system, which used its own data to make decisions about its activities in the delivery of products or services. The problem with this approach is that very seldom, if ever, does all of this information agree. Marketing sells one thing, manufacturing makes something else, engineering makes changes and accounting tries futilely to make it all balance on the books.

In this scenario, no one really knows what the "facts" are. The only way to develop any reliable information that portrays uniformly the facts of the business is to integrate fully all the data about the business.

Full data integration requires the use of normalized data, data reduced to its lowest common denominator. This normalized data is then stored in subject data bases that contain all the information about a given subject. Vendors, for example, could be a subject.

This data, stored once for everyone, is made available to any system or user requiring it. Vendor data would then be accessed by purchasing, accounts payable, engineering and manufacturing. Everyone in the organization would have access to the same vendor information, and each department would be in constant communication, via the data base, to make effective business decisions.

Data integration is really nothing new. The concept was introduced by data base management systems more than 15 years ago. But because the architecture of data bases varied with the requirements of the applications they served, we find ourselves today with almost as many data bases as applications. As a result, instead of having redundant data, which the data base was designed to eliminate, we now have redundant data bases and still no real integration.

The next dimension of integration is transactional integration. Just as data integration ties all systems and users to a single set of data, transactional integration ties together all the events or transactions that occur in these systems.

Events occurring in one system must update the data base and communicate those changes to other systems or users who, in turn, will use the data to plan or replan their business activities. This coordination and communication of activities ensures that events in one area of business appropriately affect related events in another without the need for manual intervention.

To accomplish this, the programs in these diverse applications must be triggered by changes in the data base. These changes, in turn, produce replanning logic or exception reporting to ensure that operating objectives are effectively met. In addition, the system must produce appropriate operational and financial audit trails, as well as historical records, to reflect the source and sequence of these business events.

Transactional integration, like data integration, is not a new concept. But its application has been broadened and extended as the notion of integration has matured.

Operational integration

Operational integration involves the sharing of information in one system by programs or screens in another. Without such sharing, significant benefits will be lost. Software investments intended to reap these benefits

"HOW LONG DO YOU PLAN ON STAYING WITH OUR COMPANY?"

INTRODUCING THE BURROUGHS B25.
THE MICRO COMPUTER
THAT GROWS WITH YOUR BUSINESS.

Buying a computer is a lot like hiring an employee. You need one that can produce a lot now and even more in the future.

Take the B25. It's modular, so when you need more memory or storage, you simply snap on more modules.

Another feature that allows the B25 to grow with you is its ability to network. You just add workstations and people will be able to share the same data and memory at the same time.

You can also share peripherals—like printers. Which means several workstations can be linked to one printer so many people can use it.

What's more, the B25 has three operating systems (CP/M-86,® MS-DOS,™ BTOS) so you can run the most popular software available today.

And, of course, the B25 is backed by Burroughs' worldwide service and support.

The Burroughs B25. You wouldn't hire a person who couldn't grow with your business. Why buy a computer that can't?

THE QUESTION ISN'T WHO'S BIGGER.
IT'S WHO'S BETTER.

MS-DOS is a trademark of Microsoft Corporation. CP/M is a registered trademark of Digital Research, Inc.

will be largely wasted.

Consider this example, using the entry of a customer order, to illustrate the point. A customer calls in an order for a standard item to be delivered within normal lead time. The order entry clerk accepts the order, without *confirming* availability through the production schedule, because such a confirmation would require signing off the order entry system and signing onto the production scheduling system.

Because this is a time-consuming and awkward procedure, it is rarely, if ever, executed. Customer and production problems result from these borders or barriers between systems because valuable information, although available, goes unused.

A solution to this common problem involves the integration of systems so that screens from one system (production scheduling) can be accessed without sign on/off procedures from the operator in the order entry system.

This facility allows an order entry clerk to easily check production schedules, inventory records, shipping schedules and even customer credit information to make sure that the order can, and should, be filled under terms confirmed at order entry time.

Ideally, all screens and reports across all applications should be presented in a common format, using common terminology and sharing a common security mechanism. As a result, once someone learns a single application system, that person should be able to learn additional systems quickly and easily. This can dramatically reduce an organization's training, documentation and support requirements.

Some software people have used the term "borderless" to describe this aspect of integration. To someone who does not routinely use a CRT terminal, this may not seem important, but the fact is, if it is not convenient to access a particular inquiry function, that information will go unused, no matter how valuable it may be.

Software solution

The only practical way to achieve these dimensions of integration is through the use of a complete set of complementary software designed to support the needs of every level of the organization and the various aspects of data processing.

Support for predictable business events (recording shipments, maintaining customer master files, tracking on-hand inventory and so on) should all be largely available from the standard application packages. These functions build and maintain a single corporate data base organized under a common set of data management tools.

Unpredictable information needs or queries (for instance, "How many orders for Part No. 2341-A came from the western region in the last 90 days?") should be supported by the data retrieval and decision support systems (report writer, word processing, electronic spreadsheets, graphics and so on) that are general-purpose in nature and that are, in turn, integrated with the data management software and therefore common to all the primary application systems.

A fourth-generation application development language should also be used to bridge the gaps between the application packages and the unique business needs of a particular company. With such a system, it is possible to extend and enhance the prepackaged systems for maximum functionality and performance while maintaining the software in a manner that accounts for incorporation of future enhancements from the vendor.

Communications link

In order to utilize fully the power of microcomputers, an integrated mainframe-micro communications link should allow personal computers to download, manipulate and upload information from or to the central data base. Again, the important point is that this function can be performed against any portion of the data base, without regard to the system that maintains the information that is needed.

For organizations with multiple CPUs, integrated network management software should provide efficient communications with far-flung divisions or departments on an organizationwide basis.

In the larger sense, integration provides a company with the ability to organize and manipulate information with maximum ease and efficiency. Organizations that are able to achieve fully dimensional integration of their computing resources are the ones that will be the most competitive in the future.

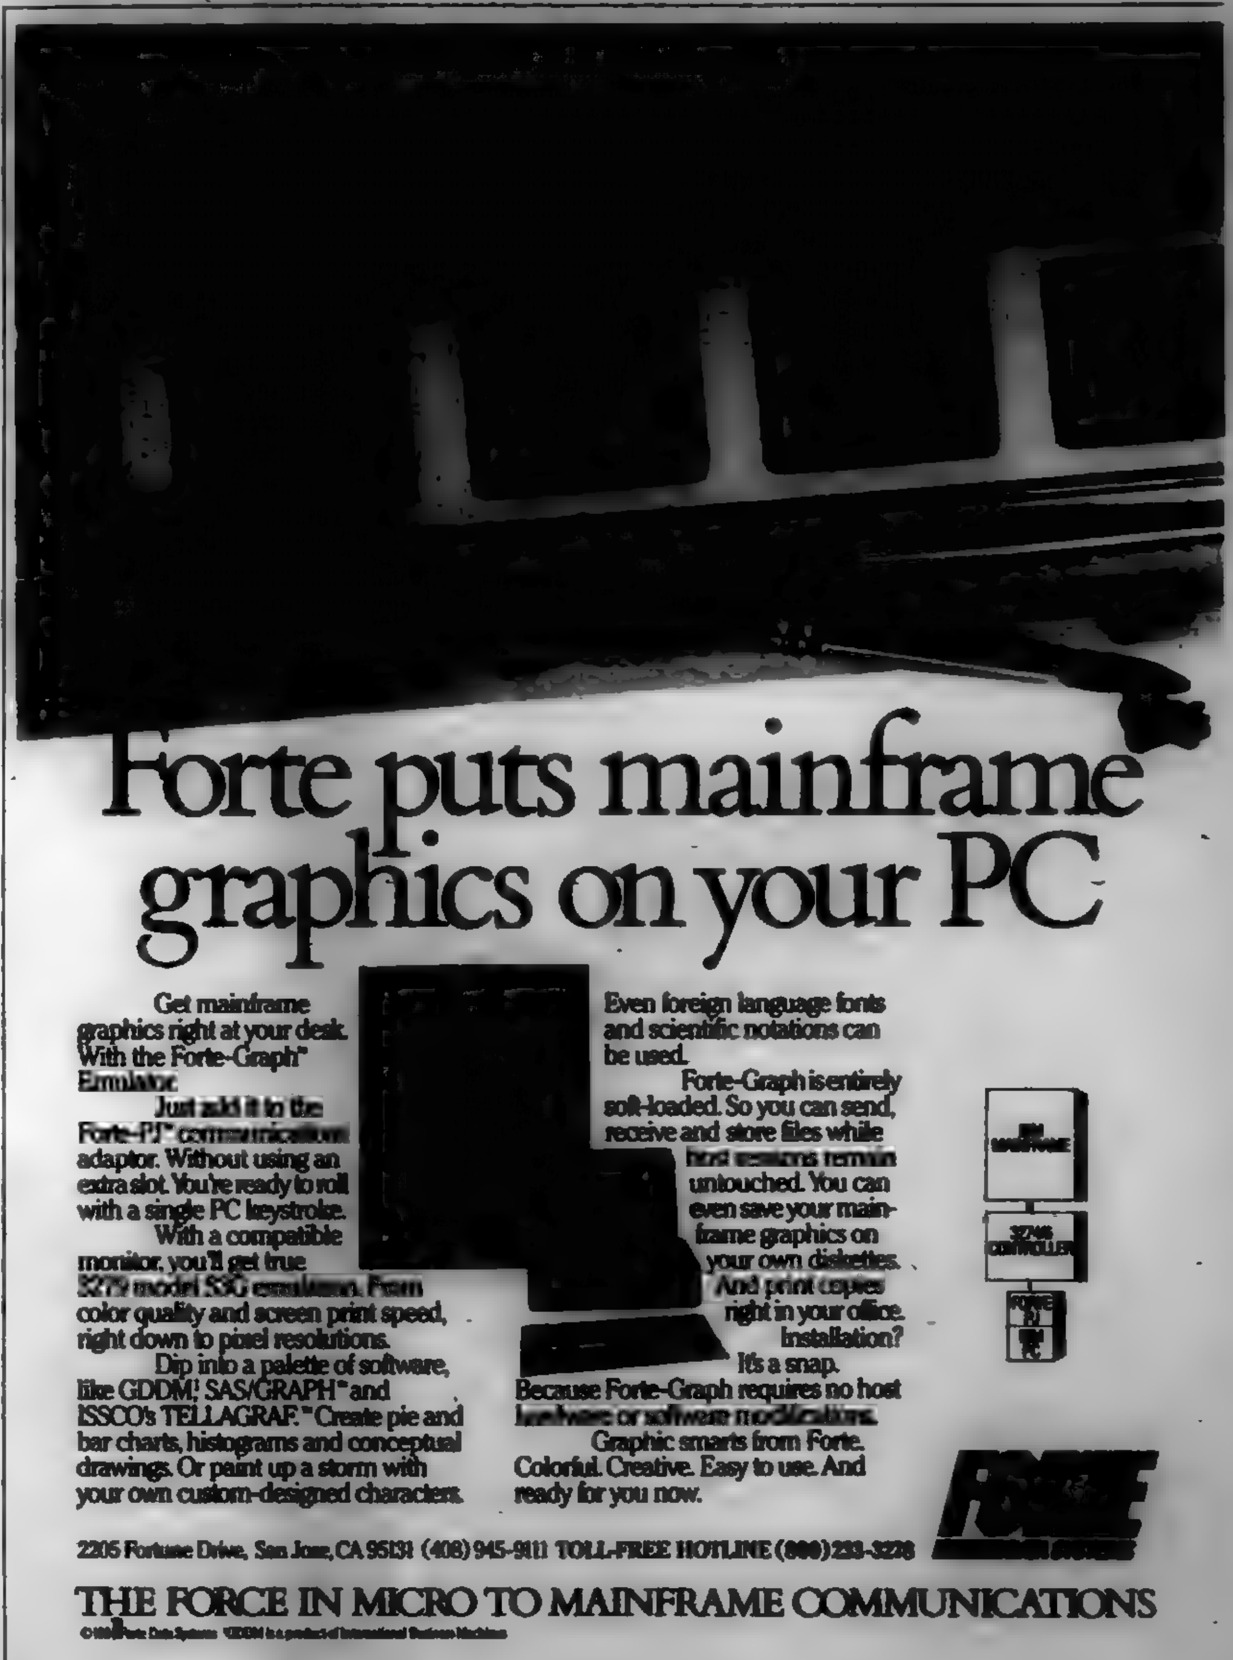
Benefits of integration

Clearly, well-coordinated organizational activity supported by integrated information systems will have a major impact on success in the marketplace, profitability and, ultimately, the relative success of the organization as a whole.

An organization with an integrated software system can expect such tangible benefits as:

- Improved manufacturing performance.
- Shorter lead times for planning.
- Improved inventory control.
- Accurate vendor performance analysis (delivery, quality, price).
- Improved vendor negotiations (reduced costs).
- Accurate payments.
- Reduced clerical effort.
- Improved cash flow visibility.
- Improved management communications.

These benefits illustrate the positive impact integration can have on an organization. A common by-product of the implementation of a closed-loop manufacturing resource



Forte puts mainframe graphics on your PC

Get mainframe graphics right at your desk. With the Forte-Graph™ Emulator.

Just add it to the Forte-PJ™ communications adaptor. Without using an extra slot. You're ready to roll with a single PC keystroke.

With a compatible monitor, you'll get true 3279 model S3G emulation. From color quality and screen print speed, right down to pixel resolutions.

Dip into a palette of software, like GDDM,¹ SAS/GRAPH™ and ISSCO's TELLAGRAF.™ Create pie and bar charts, histograms and conceptual drawings. Or paint up a storm with your own custom-designed characters.

Even foreign language fonts and scientific notations can be used.

Forte-Graph is entirely soft-loaded. So you can send, receive and store files while host sessions remain untouched. You can even save your mainframe graphics on your own diskettes. And print copies right in your office.

Installation? It's a snap. Because Forte-Graph requires no host hardware or software modifications.

Graphic smarts from Forte. Colorful. Creative. Easy to use. And ready for you now.

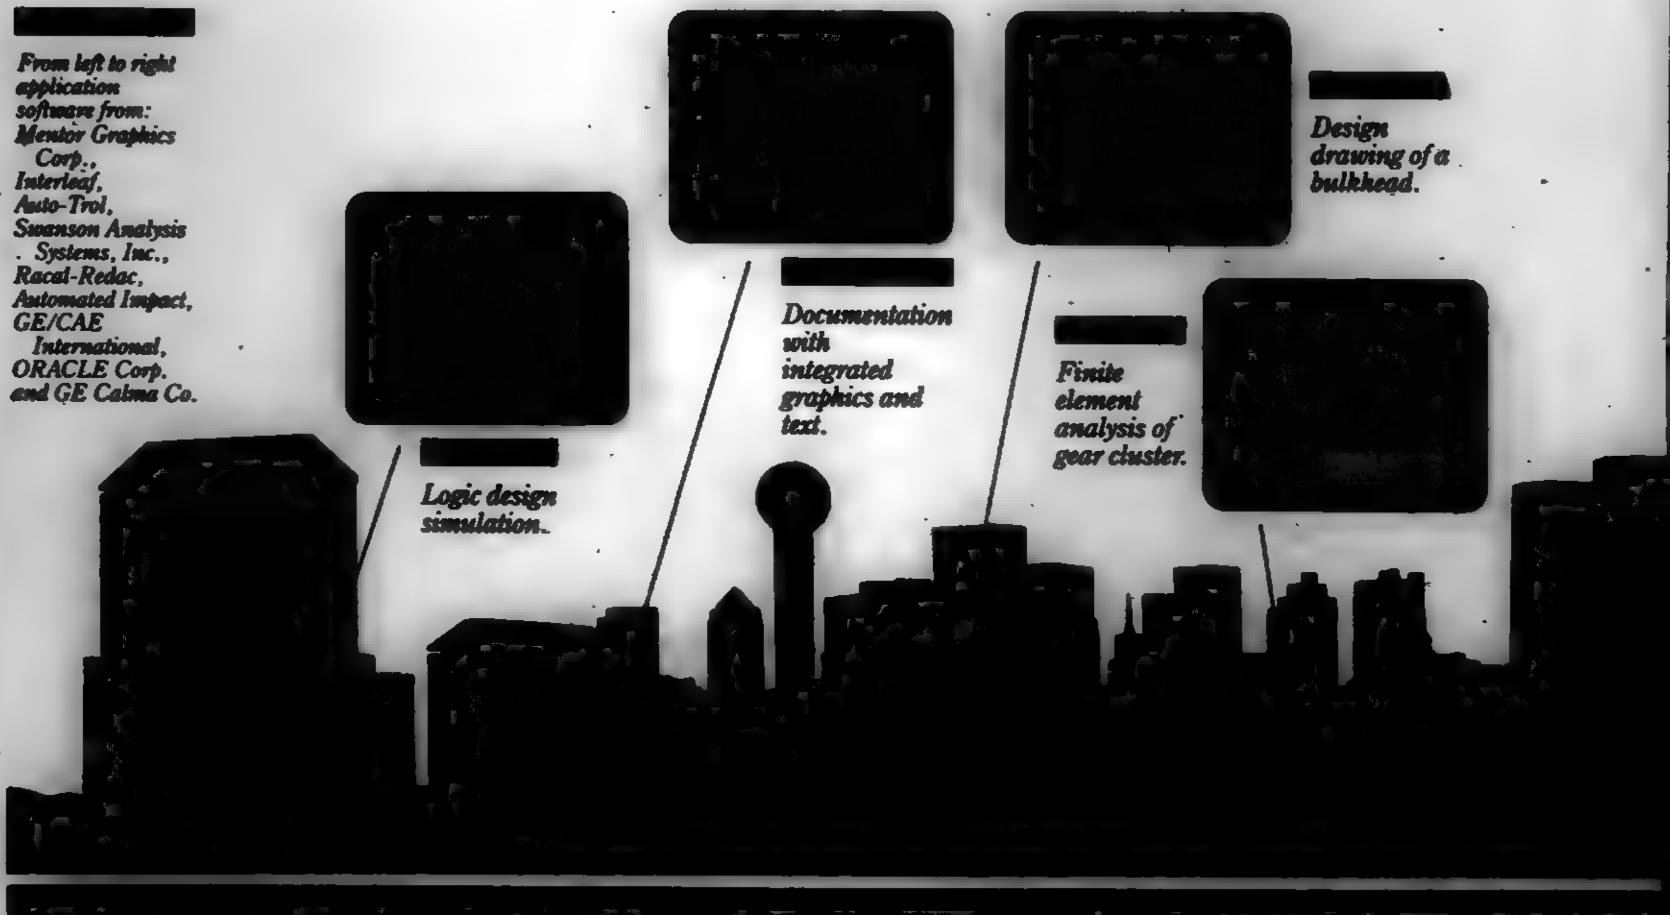
We make computers that design what you make.

We're Apollo Computer, the fastest growing professional workstation company in the world. And for some very good reasons.

We introduced a new standard in the computer industry.

In 1980, we introduced the next step in the evolution of the computer. With the logical successor to timesharing: DOMAIN* processing.

DOMAIN processing puts on the desk of every technical professional exactly what they need to design and develop new products. Dedicated 32-bit workstations with the compute power of a mainframe. Closely-integrated, bit-mapped graphics. And a high speed local area network that shares information and resources. The result is a fully integrated, dynamic environment that lets your technical professionals produce better, more innovative new products in considerably less time. With considerably lower development costs.



From left to right application software from: Mentor Graphics Corp., Interleaf, Auto-Trol, Swanson Analysis Systems, Inc., Racal-Redac, Automated Impact, GE/CAE International, ORACLE Corp. and GE Calma Co.

Logic design simulation.

Documentation with integrated graphics and text.

Design drawing of a bulkhead.

Finite element analysis of gear cluster.

We have a family of compatible workstations.

Today, we have an unprecedented range of DOMAIN workstations to meet whatever design and development needs you may have. From our high performance VAX™ 780-class DN660 (color) and DN460 (monochromatic) for applications like finite element analysis and solids modeling, to our midrange DN550 for applications like integrated circuit and printed circuit board design. To our low cost DN300 series for applications like software engineering and technical illustration. And all of our DOMAIN family of workstations are completely compatible.

We have nearly 300 technical applications packages.

To stay competitive today, you have to look beyond automating individual tasks. So we allow you to automate the entire development process. With nearly 300 of the most powerful and prestigious third party applications packages available today.

If you'd like to know how we can help boost your technical professionals' productivity and shorten your product development cycle, you have only to ask. Write or call Marketing Communications, Department A1, Apollo Computer, 330 Billerica Road, Chelmsford, Massachusetts 01824 (617) 256-6600 Ext. 4497.

IN DEPTH/DATA INTEGRATION

planning II system is that for the first time the purchasing manager, the production manager and the shop foreman actually begin to communicate with each other on a regular basis. Computer systems with arbitrary borders actually inhibit rather than enhance this process.

In many organizations these people often have little or no idea of how much they have in common or how much impact their actions have on the company as a whole. With more integrated systems, they begin to see how their particular arm of the organization is critical to the effective operations of other areas.

The availability of consistent, reliable, easily accessed information from an integrated set of systems can provide benefits beyond those that are obvious. When the artificial boundaries between organizational functions like manufacturing and accounting are removed, people naturally begin to apply their own native ingenuity to day-to-day activities. (Of course, system security is necessary to avoid too much ingenuity).

Easy access to common, reliable and timely information can create a climate for creativity throughout the organization. People can begin to find new ways to use information to solve problems, improve efficiency and generally raise the overall performance of the organization as a whole.

Why not everyone?

Probably no one would argue against the benefits of integration..If so, then why hasn't every organization implemented an integrated information systems environment? Some organizations are actually doing it, especially smaller, younger companies. Many of the largest companies, however, are not yet ready, for a variety of reasons.

Manufacturing systems have only recently matured to the point where financial systems have been for a number of years — to the point where there is a high degree of agreement as to what the basic required functions are in a system. Usable, integrated manufacturing software was not available a few years back.

Software vendors tended to focus on specialized application areas in the past. Few even considered the concept of integration beyond that scope, much less committed themselves to developing it.

Even when the potential has been recognized, the cost and difficulty of developing what amounts to a single (though modular) system that encompasses application support for all aspects of a business, as well as general-purpose data management and retrieval tools, has been too great for all but the largest software vendors.

The world of application software is, however, changing dramatically. A whole new generation of application software is emerging, along with a new generation of software companies. The companies that built the leading data base management systems (the foundation for all applications) are now building major packaged application systems designed to take advantage of this emerging software technology. These new-generation system builders are uniquely positioned to build these systems because they alone have laid the required foundation for such systems.

This new generation represents great strides toward truly integrated systems. They represent the foundation upon which companies are beginning to build their information systems for the 1990s.

With this new generation of software now becoming available, the key to integration for any large company is long-term planning. While you may be wrestling with a veritable fruit salad of application systems right now, it doesn't have to remain that way. By stepping back and taking a global approach, a long-term systems investment and implementation strategy can be devised.

IN DEPTH

MOVING MIS AND THE COMPANY INTO THE FUTURE

By Robert Peterson

Through all the technological advances of the past, the MIS charter remained the same — we provided systems and computer power to the company. Now that charter will change. The specific industry and organization we serve will determine precisely how we change. MIS will truly become a services group. We can either plan for that transition and guide its outcome, or we can ignore it and conduct business as we always have.

If MIS is to remain a viable, dynamic part of the corporate community, we must move quickly to effect that transition. Otherwise, we will become merely a utility function, driven from the outside and responding solely to specific directives. The organization will most certainly suffer, even while never realizing it.

Being an executive in MIS is not for the weak of heart or those who require a highly stable environment. We have seen the discipline change so dramatically, in a relatively short time, that experience more than 10 years removed is nearly extraneous. MIS now rates as one of the 10 most stressful occupations, according to recent studies. The future doesn't promise any respite.

Over the years, the bulk of the changes have been technology-driven. The raw power of hardware and software has yielded opportunities for information facilities. These opportunities presented themselves in such a way that the MIS professional was in a position to market them to the customer community. What MIS didn't want to address, it didn't market — a very nice situation indeed.

We now find ourselves in a different situation. The advent of personal computers, end-user development systems and a general rise in computer literacy has put an extraordinarily high level of pressure on the MIS professional. We are now being driven into a new age by our customers who are no longer content to wait for us to understand the issues facing the organization. The implications of this transition drive into the very framework of how we operate and how we support the corporate community.

Anticipating the impacts

With the wide range of new opportunities, technological variations and choices facing us today, how can we predict the future with any degree of success? The answer is that we cannot. There are simply too many issues on the horizon; any number of them could present themselves as prime issues. What we can do is make ourselves aware of the major issues facing us in our specific environment and begin to prepare as best we can for the future of highest probability.

This isn't something done over coffee one morning. It is a down to earth, well-communicated planning effort that takes place constantly among the senior staff of the MIS group. The planning effort includes assigning staff members to study options and alternatives, produce study members to explore options and alternatives, produce study reports on those efforts and present them to the senior staff.

It means a concrete strategic plan that concentrates not only on the business environment but on what MIS will do to assure its viability. More than anything else, the planning effort means promoting that idea to upper and middle management and gaining their cooperation and commitment.

The key impact areas will vary from organization to organization. But even if they didn't, the priorities and marketing method would vary to such an extent that the issues would not even look the same. There are, however, some obvious issues facing all of us today.

End-user computing

Probably the greatest impact for the future that exists today takes the form of end-user computing through the use of decision support systems, statistical analysis and presentation capabilities, data base managers and application generators. We have actually entered an age where the user may not need us — or at least the wherewithal exists by which he can make a case for it. It is a difficult argument to fight, especially in the abstract.

If we honestly evaluate the probabilities for the future, end users will be generating the vast majority of their own systems. MIS will concentrate on the very complex portions, building architectural frameworks around the users' efforts and protecting the corporate information base. With all this, it is safe to assume that systems development as we know it today — with its feasibility studies, analysis, programming and testing phases — will go the way of the dinosaur.

Futurists have tried to predict time frames for this progression for years with little or no success. But the changes will take place — and in the not-too-distant future. The inevitability of this progression is stamped in the power of the software on the market today. That power is nowhere near what it must be to totally support end-user development, but the progress toward that power level is now taking place. The realization of the capability is just around the corner.

The opportunities for disaster in this type of environment are staggering. With all the emphasis placed on computer literacy in recent years, we must never forget that literacy does not mean proficiency or professionalism. Uncontrolled information manipulation provides incredible opportunities to misrepresent key corporate decision issues.

When this happens today, the hope is that the bureaucracy of the development cycle itself will preclude strategic decisions being made on faulty information. That certification of systems is a by-product of an independent development organization. With end users making the effort themselves, certification will not necessarily take place — unless MIS plans and implements mechanisms to ensure its existence.

It is unwise to confuse computer literacy with computer expertise. Literacy will allow the general user environment to develop solutions to its own problems — given the framework to make sure those solutions conform to good practices and corporate goals. It is the computer professional who will provide that framework and monitor compliance with those practices.

Realistically, there is little hope that MIS can keep pace with the accelerating demand for computer solutions to business problems. In a competitive marketplace, an emphasis exists on the ready availability of usable information. Providing that information base requires systems for capture of the daily activities, entry of demand, maintenance of product or service flow and delivering that product to the end customer.

Even with the influx of fourth-generation languages, increasingly sophisticated data base management systems and scientific methodologies, MIS continues to fall behind in the demand for new systems. Backlogs increase to the point where they are no longer really backlogs but daydreams. It is a significant and severe problem.

Corporate Information Centers as Their Planning Language.

FTP Survey

Since most organizations are not likely to create an MIS group of infinite size, the solutions must come from quarters other than improvement of the conventional mechanisms of developing and delivering systems.

The typical contract/consulting groups will have to change and improve as well. These groups can no longer afford to be body shops that ship out programming talent.

We will see an increased sophistication in the level of shelf-package software to the point where we will purchase core units that can be modified and maintained by the end user with MIS guidance.

In order for this to be feasible, the software producers will have to change their approach from a single approach solution to the creation of tool kits tailored to generic applications — accounts payable, manufacturing resource planning, check processing and so on. With the central core and adaptable peripheral modules, organizations will still have the ability to create an endemic hybrid that will make their approach different from their competitors.

We should see a higher use of contract and consulting services at the expense of internal development staff. This change means a lowered investment for permanent staff as well as the ability to apply more specific skills to specific problems. MIS will remain the coordinating force and communication vehicle between the company and the vendors.

The typical contract/consulting groups will have to change and improve as well. These groups can no longer afford to be body shops that ship out programming talent. They must evolve into stable, professional organizations that can provide specialized talent at all levels, from project management to coding.

A substantial portion of the development effort will be accomplished directly by the user community. Their effectiveness will be largely dependent upon a number of factors, including evolution of software products, continued improvement of the price/performance ratio of hardware, availability of a reasonable data base approach and the evolution of the MIS professional's consulting capability. The last factor may be the most important relative to the health of the organization.

MIS, if nothing more, is quite competent in the role of project management. We take it for granted, but the typical cycle of project to project is something that everyone is not inherently good at. With end-user development we will see the project mode of doing things moving into the areas where steady-state maintenance is the prime orientation. Project roles are somewhat foreign. One of the major contributions the MIS professional can make is to bring project management and control expertise to the typical user development efforts.

Dispersing of MIS

In many organizations today, we see a subtle dispersing of many traditional MIS functions outward into the user community. A substantial portion of the cost/benefit efforts are there. The development methodologies shift a large part of the responsibility for analysis and design, and in many organizations the testing efforts are the user's responsibility. In a truly pragmatic sense, it represents a logical and healthy transition of responsibility.

However, like a train gaining momentum, it can be very difficult to stop. Often, functions are transferred with only a vague understanding of what ancillary activities are implicitly transferred. These ancillary activities can very quickly come back to haunt us in very subtle ways.

MIS is independent of the political motivations of other departments. Therefore, it takes (or should take) a less parochial view than any single area. MIS tends to seek solutions without bias that serve and protect the entire organization. When any single user area takes responsibility for the design and justification of a system, there is less protection for the balance of the company.

The only way to deal with this situation is for MIS to take an active role in review and recommendation for all development efforts. That role is substantially different than total control of a project and requires a different view and talent. Understanding these differences and establishing the procedural mechanisms to ensure success is important for the future.

Data base environment

The promise of the integrated corporate data base with its ability to secure and protect the corporate data resource has had, at best, a spotty realization. Few organizations today can honestly say that they have successfully implemented a data base facility that meets the goals they started out trying to achieve. It appears unlikely that we will ever see such a realization.

The limitation occurs for two reasons. First, we have never been able to truly communicate the abstract need for an integrated data base to the management of our user community.

With some notable exceptions, management has never seen the need to get overly excited about the opportunity, at least to the point of

Only EXECUCOM Gives You Decision Support Systems with This Much

Support.

Let's face it. Your job is tough. As manager of the Information Center for a multi-million dollar corporation, you deserve only the best software, service and support.

You handle information and processing requirements for hundreds of executives. Every week, you receive new requests for more data... better applications... and more sophisticated models and consolidations. The pressure is on for your users. Their decisions must be dead-center accurate. Every time. It's up to *you* to give them the total support they need.

Execucom is the perfect answer. For you. And for them. Using Execucom's unique family of decision support systems, *users* can solve multi-dimensional business problems—without demanding large chunks of valuable time from you or your staff. With mainframe IFPS® and IFPS/Personal® they receive the ultimate in decision support. An integrated language and powerful micro-to-mainframe link enables them to directly access the Corporate Information Center and quickly develop applications on their IBM PC®. And with Execucom, *you* get the most complete product line support available in the DSS industry. Each Execucom package includes comprehensive training for users, thorough documentation, and prompt "Hot Line" service. Best of all, our programs are time-tested for proven performance. Fact is, we have more system installations than any other DSS vendor. And, our software runs on more types of hardware than other competitive packages.

Execucom. The number one choice, nationwide, of Corporate Information Centers—just like yours. And, number one in customer service and product support. Call 1/800-531-5038 (In Texas or Canada, 512/346-4980). Or write Execucom Systems Corporation, 3410 Far West Boulevard, Austin, Texas 78731.

dedicating substantial time to the idea.

Secondly, it is a substantial expense to create subject data bases with the inversion capabilities that allow the gains to be realized.

The more systems we install — or the users install — the further away we find ourselves from the integrated solution. There can be no argument as to the advantages of an integrated, integral data base management system. However, we must be pragmatic enough to realize that the concept may never be realized and take steps that alleviate some of the problems of not having [illegible]

This is far from an exhaustive list of major issues facing MIS today. The emergence of the information center, the personal computer revolution, enhanced communications capabilities and a host of other issues face the MIS executive today. Whereas it is difficult to perceive where these issues will take us, it is essential that we take steps to ensure that they are not the cause of our demise in the corporate structure. That demise is a very real possibility if we do not adequately determine where we go from here.

Planning for transition

The planning function within MIS typically concentrated on presentation of business issues and how we will react to those issues. While that is certainly essential, it is only two-thirds of the need at best. What we cannot ignore are the internal aspects of the department and how we will react to our own future.

The issues facing MIS as a discipline should be defined and discussed relative to their importance to the specific environment. For instance, the issue of hierarchical data bases with decision support facilities for all knowledge workers is certainly less critical in a mill environment than at a statistical research firm. It is imperative to concentrate on the issues that are most likely to impact you specifically. Those are the ones that are most urgent, and they are probably the only ones to which your management will react.

The implications, cost factors and competitive impacts should be highlighted as well as the steps to protect the organization from mistakes in each area. We should project a comprehensive picture of where MIS is going for the next five years and how that transition will affect the company.

Typically, management prefers to relate to action-plan type scenarios. However, in an evolutionary environment we are not always dealing with subjects that translate readily into actions. While management may not like to deal in that framework, it is simply going to have to if its information resources are to remain valid and useful. The generic, abstract issues must be stated and the department's plans to facilitate the transition described.

These abstract issues can be a far more traumatic set of problems than the well-directed specifics. They tend to be molded into the framework of how the department does business and how it interacts with the other groups within the corporate body. The following issues deserve a high level of consideration.

Place for your people?

In the MIS organization of tomorrow (not 10 years from today, but tomorrow), the prime emphasis for development personnel will be on the attributes of consulting, communicating and coordinating. These attributes will be the interface point to the user/developer with a prime responsibility for protecting the overall organization from information abuse and misuse. The cloistered programmer/analyst will be a creature of the past, except in highly specialized cases.

If the conventional development approach has characterized your organization for the past several years, you are likely to find yourself with a rather striking mismatch of needed skills to possessed skills. If that is the case, ask yourself what steps you can take to rectify the situation in the long run and how you can migrate your personnel skills over time.

The comprehensiveness of that plan is key as is its visibility. The plan should be communicated effectively to the staff so it does not feel its future is in doubt. Being reasonably intelligent individuals, the staff will quickly perceive the changes taking place and be quite sensitive to the implications. It is imperative that they do not feel threatened.

TAKE A MOMENT TO SIZE UP OUR COMPETITION.

Now that we've introduced the new AGILE 6287 Printer/Plotter Protocol Converter, there's one thing we can say about our competition . . .

. . . they're a very nervous flock.

And for good reason. The overall quality of design and engineering is evident throughout the 6287. From its upgradability and optional APL, through its built-in diagnostics, internal power supply and fan, the 6287 assures you of consistent high performance. A performance that is backed by a full two-year warranty.

Whether it's high speed printers, plotters, dot matrix, daisy wheel or even laser printers, the AGILE 6287 is the Protocol Converter you can count on.

As for our competition, we'd count on them only when we had trouble sleeping.

[illegible]

There seems to be an almost pathological desire by upper management to stay as far as possible from decisions that involve MIS.

One of the chronic cries from MIS has always been that management chooses not to get involved in issues related to information services. In general, the complaint is valid — there seems to be an almost pathological desire by upper management to stay as far as possible from decisions involving MIS.

Volumes have been written on the reasons why and recommendations as to how the situation can be changed. The bottom line is that without management's understanding and backing, any hope of moving to an effective new era of MIS is moot.

After nearly 25 years of MIS influence on the future growth capabilities of most organizations, it is unreasonable for any senior executive to ignore the importance of comprehensive information planning.

The successful integration of that resource into the general plans of the organization is essentially a matter of corporate life and death in an increasingly competitive marketplace. The senior executive should and must stay actively involved in MIS planning.

Look elsewhere

If the senior-level management of the company you serve chooses to avoid the issues, refuses to hear the logic behind the need for effective planning and/or considers MIS to be a necessary evil — find another organization.

If you consider yourself a forward-looking MIS professional then you are wasting your time with that organization. Find one where they recognize the changing world; there are plenty of forward-looking managements that will appreciate and reward your efforts.

For those of you with reasonably mature upper management, the concentration point in your marketing effort must be on the future that you are planning. Don't be overly definitive. The future is hazy at best. Presenting it in a strategic plan doesn't make it any less hazy. Concentrating on where you intend to go based upon probable variables will make your interim steps (which are really what you want to sell) substantially easier.

Much of what can be done with the new development tools depends upon the sophistication level of the user community. That is a factor that must bear heavily on the plans for MIS. Sophisticated, intelligent users allow for a substantially lowered commitment to education and training as well as a considerably lowered requirement for constant assistance.

Faced with a level that is incompatible with the need, one has two choices: attempt to create foolproof system interfaces or raise the sophistication level selectively.

If the senior-level management of the company you serve chooses to avoid the issues, refuses to hear the logic behind the need for effective planning and/or considers MIS to be a necessary evil — find yourself another organization.

The first choice is the one typically taken and the least likely to succeed. It is expensive, penalizes aggressive, dedicated individuals and stifles innovation.

The second option is the only rational approach and will require the commitment of management for reallocation of some existing personnel, raising the selective hiring standards and some costly training. However, in the long run, the cost is substantially lower and the results more lasting than trying to create systems for gorillas.

Turnover rates

It is nearly impossible to build any type of future organization without a stable core of senior people to build around. People are always the key ingredient in any attempt to change the general direction of an organization. Often, the change itself will produce or aggravate a problem turnover rate; equally as often it will correct one.

MIS has historically been satisfied that turnover in excess of 25% was inevitable. In some major cities where competition is abnormally high this may be the case. However, accepting those rates is the prime guarantee that they will continue. Only by determining the bottom-line reasons can we ever hope to overcome them.

This has been a sample of the types of generic issues facing the typical MIS organization. They should not be surprising nor enlightening. They have appeared in the press for years with long, expert treatments of each subject.

But reading about the issues facing us is not enough. Until they are addressed and analyzed and approaches are devised for your organization, by you and your people, they will not be solved.

It is not enough to say that the MIS we know today will not exist tomorrow. It is not enough to convince management of that fact. You must understand what the transition means to your organization and take steps to make that transition take place in as orderly a fashion as possible.

Establish strategy sessions among the senior members of the MIS staff, and detail the prime issues. Boil those down into very pragmatic statements on impact, probable time frame and solutions. Establish study teams to determine how other organizations have addressed the issues or plan for them yourself. Create formal plans, procedures, policies and practices to ensure that the organization is properly serviced.

In any case, plan for the transition and communicate those plans to management. Spend the time now to make your staff part of that planning effort, not casual observers. The opportunities of the future will be realized by the aggressive, conceptual thinkers who define the leading edge, not those who follow. It is not a simple matter of being sophisticated but rather of ensuring the survival of MIS in your organization.

IN DEPTH

WOMEN IN COMPUTER SERVICES

By Judith Larkin

Recent data from personality tests, questionnaires and a job satisfaction survey sheds light on three areas: the psychological characteristics of women in DP, the sources of satisfaction and dissatisfaction in their jobs and concerns that might be addressed through workshops and training.

Over the past three years, I have conducted workshops on leadership skills for systems engineers at the Computer Task Group Education Center in Buffalo, N.Y. The systems engineering group is composed of the technical people who work as applications programmers, systems programmers and systems analysts.

During the three-day management training course, I administer the 16 Personality Factor Questionnaire (16PF), an adult personality test whose reliability and validity have been well established. A multipage, computer-generated description of the individual's personality, which is later sent to participants, was designed to help them gain insight into themselves and plan their careers.

A STUDY

The women subjects of this study are technicians with the title of systems engineer. They function as programmers, programmer/analysts and systems engineers, providing professional services in the design, analysis, implementation, maintenance and management of software systems. The majority of the women who provided data for this study are employed by Computer Task Group, Inc. and are spread thoughout the country, doing contract computer work at different client sites in a variety of industries.

This discussion also reflects the input of a number of women at Computer Task Group and several other software companies who have advanced from the technical ranks to become managers of data processing personnel.

> *From these studies, the DP woman emerges as a committed professional: intelligent, independent, persistent in striving to accomplish difficult tasks and maintain high standards, assertive in attempting to control and impose order on the environment.*

In the management education program, I have tested 58 women systems engineers, 11 of whom became managers, and 179 men, including 39 who were or have become managers. The results discussed here are based on the scores of 47 women, all nonmanagerial systems engineers. Data on the men was discussed in a previous *Computerworld* article [CW, Feb. 21, 1983.]

A group profile on the 47 women was developed by pooling individual data from the 16PF tests. The results of statistical tests showed that compared with the population average for women, DP women are significantly different on the following dimensions:

1. More intelligent, capable of abstract thinking, bright. They tend to be insightful, fast-learning and intellectually adaptable.

2. More assertive, aggressive, competitive. This trait is also expressed in independent-minded behavior, sometimes unconventional and headstrong, that is not easily upset by authority.

3. More conscientious, persistent, persevering and determined. This personality factor characteristically expresses itself in a drive to do one's best and a high level of achievement motivation.

4. More venturesome, socially bold. The combination of toughness and sociability is important in occupations that require dealing with people and emotional situations — but especially so if one is to feel comfortable venturing into such diverse work environments as banking or manufacturing to tackle work assignments.

5. More tough-minded and realistic. Not prone to dwell in fantasy or sentimentality, DP women take a tough, practical, realistic (no-nonsense) approach to situations. They tend to keep to the point and act on practical, logical evidence.

6. More experimenting, liberal, questioning. This trait is expressed in a tendency to experiment with solutions to problems, an analytical and questioning approach to problems, a desire to be well-informed and a tendency to like innovation and to be willing to break with customary and traditional ways of thinking. (Executives, university professors and scientific researchers also tend to show high scores on this characteristic.)

These results are consistent with the findings of Charles Woodruff, who used a different instrument to identify the strength of various needs in a group of 50 women in DP. Compared with the population of women in general, the women in Woodruff's sample showed a higher need for achievement and need for understanding — a desire to understand many areas of knowledge, to satisfy their intellectual curiosity. Similar to the high score on persistence in the present sample, Woodruff's subjects showed a high score on "endurance" — a willingness to work long hours and not give up in the face of difficulty.

Other needs strongly in evidence included a high need for dominance — the desire to have control over the environment and to influence or direct others; a need for order — the desire to be organized and to avoid confusion or clutter; and a high need for cognitive structure — which results in a dislike of ambiguity and a desire to find answers based on definite knowledge rather than guesswork.

Personality profile

From these studies, the DP woman emerges as a committed professional: intelligent, independent, persistent in striving to accomplish difficult tasks and maintain high standards, assertive in attempting to control and impose order on the environment. J. Daniel Couger and Robert A. Zawacki found in their 1980 study of computer personnel that data processing professionals have higher growth needs than people in any of 500 other job categories they surveyed for their study. They found a strong need for personal growth and accomplishment — the need to be stimulated and challenged and to develop their abilities.

The women in the present study

"THAT'S A FIVE YEAR RATE ON THE MAINFRAME, WHICH IS ONLY GOOD UNTIL FRIDAY, A THREE YEAR RATE ON THE PERIPHERALS, EXCEPT TERMINALS; A FIXED PURCHASE OPTION ON THE MAINFRAME BUT NOT ON THE TERMINALS, WE'LL NEED THREE SEPARATE MAINTENANCE CONTRACTS, AND NO, WE DON'T DO IBM NON-COMPATIBLES OR SALE-LEASEBACKS, ANY QUESTIONS?"

IF YOU NEED A COMPUTER TO SORT OUT YOUR LEASING ALTERNATIVES,

WE HAVE A BETTER IDEA.

Phoenix Leasing now offers one stop lease shopping for IBM, IBM compatible, and IBM non-compatible computer systems and peripherals.

Configure your own system, and select your own lease plan, with terms ranging from 1-5 years for IBM and IBM compatible equipment and 3-5 years for IBM non-compatible equipment.

If our standard lease plans don't fit you, let us custom design one that does.

Contact Phoenix Leasing today. You'll find you don't need a computer to appreciate our flexible lease terms. We have a better idea for you.

Peat Marwick technology has exploded the myths about computer systems development:

It doesn't have to take forever or cost the earth.

Introducing Structured Retrofit.

The landscape of your computer software can grow rather twisted over the years. Constant change, varying needs and greater demand have rendered many systems chaotic, or worse yet, useless. And the cost and time of developing a new computer system has been a financial nightmare.

Until now. Peat Marwick introduces a technological breakthrough that gives you the best of both worlds: the technical currency of a new software system at an affordable price. It's called Structured Retrofit. Its advantages are simple: You save the valuable existing information from your present system by regenerating it in a structured format that is then used as a base to build a new system. Even on a new computer.

Your immediate benefit is you can achieve your new system with savings in time and expense as great as fifty percent of that needed to write an entirely new system. Only Peat Marwick's Structured Retrofit can do this. And you gain the long-term advantage of a major reduction in maintenance programming costs.

Peat Marwick technology creates workable solutions for your business problems. Learn more about the advantages of systems development through the Structured Retrofit process. For a free brochure and case histories, send in the coupon or call 800-621-1776 (in Illinois 312-951-7692).

fit that description very closely. Moreover, as indicated by their responses to open-ended survey questions, they are very much aware that their success in fact depends upon continually updating their technical skills, adapting to a rapidly changing environment and developing techniques for continued learning in order to stay current with technological advances.

Only in one area does the present sample differ from the findings of previous studies. With respect to "social-need strength," Couger and Zawacki found that DP professionals have a decidedly low need for interaction with others. Woodruff found that, going along with the relatively high need for autonomy, there was a low need for affiliation or to make efforts to win friendships or maintain associations with people.

The picture that emerges from the 16PF, however, suggests that DP women in the present sample may not be so extreme. They do not differ at all from other women in the degree to which they are warm, personable and caring or cool, aloof and distant. Moreover, they do not differ significantly from women in general in the degree to which they are group-oriented as opposed to having a preference for being alone.

While they also do not differ from average in emotional stability, they are significantly more candid and open (as opposed to sophisticated or shrewd) than women in general and tend to be more impulsive and enthusiastic and enjoy excitement more.

The reasons for the higher scores on the social dimensions of personality undoubtedly reflect the particular characteristics of the sample. While these women are skilled technicians, they have chosen to work in computer services, that sector of the computer industry in which programmers and analysts move in a variety of business environments and meet and interact with different clients as part of their work.

Contract programming entails working side by side with the employees of client companies on a temporary basis until a project is completed or they are assigned to another account. Women who have chosen an area of computer work involving considerable social interaction are likely to be at least average in their own social needs.

Perhaps even more important, the women were all participants in a management education program, an indication that they might already have exhibited the social and interpersonal skills expected of potential managers.

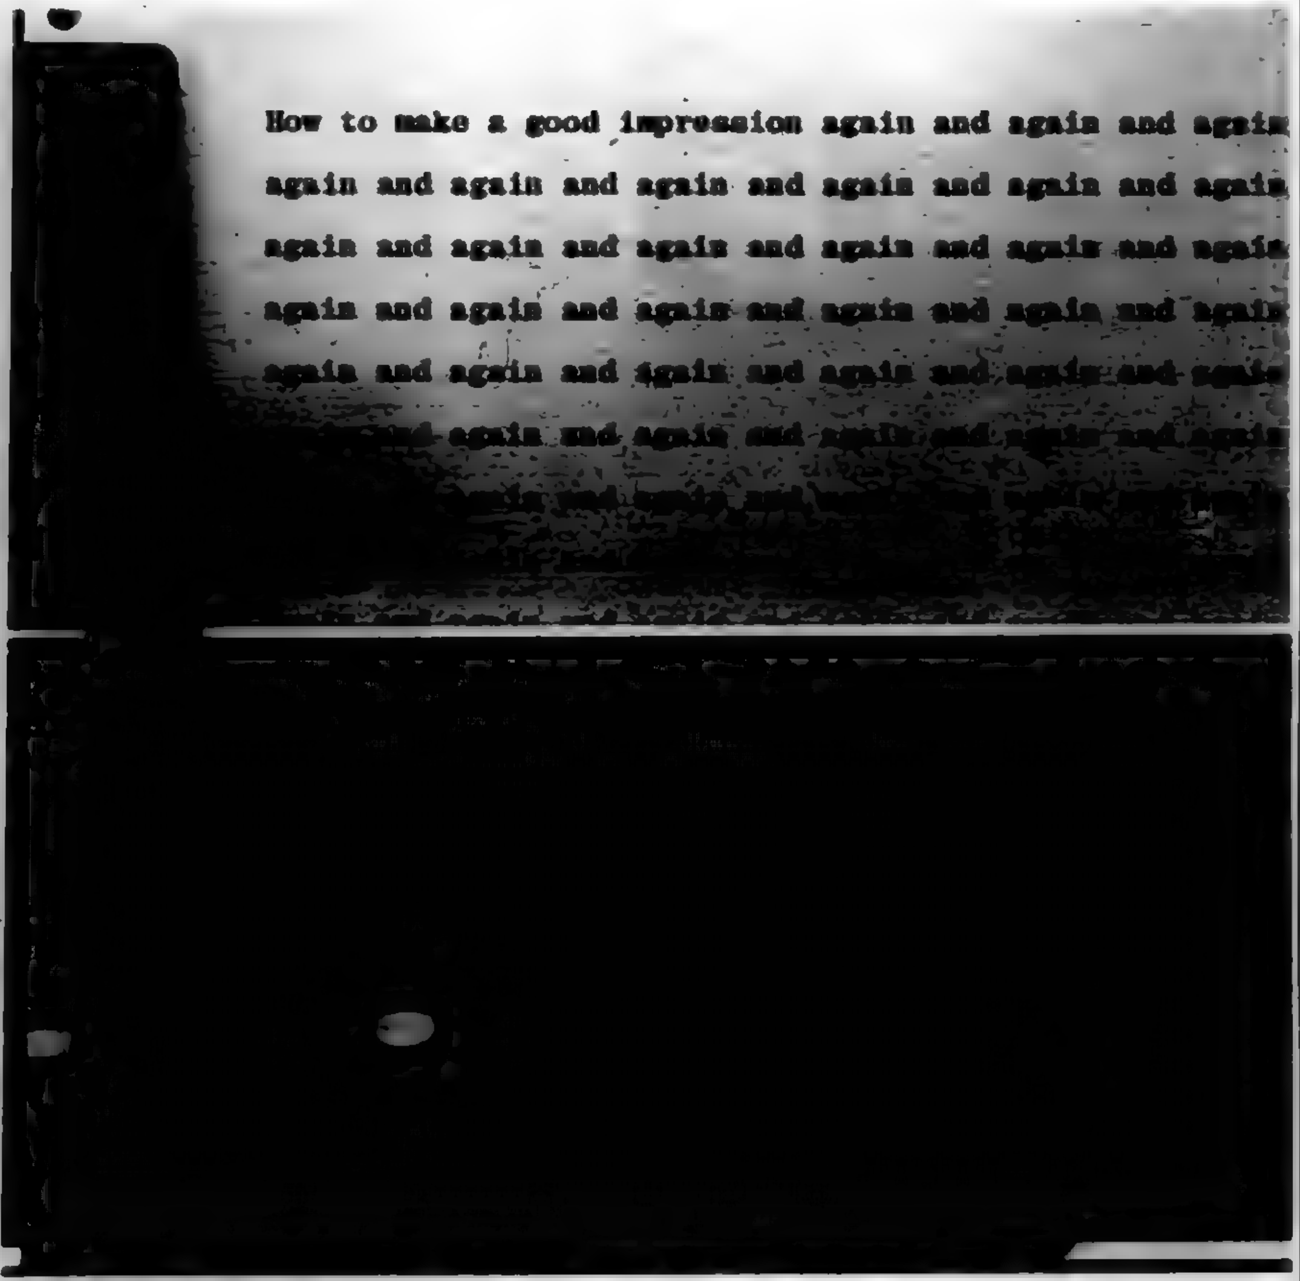
Personality test data from the sample of 140 male systems engineers who took the 16PF provides some interesting comparative information. The men showed themselves to be significantly more aloof, detached and reserved than the average male, preferring to work alone or work with things rather than with people. Unlike the women, their scores were different enough from average to contribute to the stereotype of the unsociable programmer.

Another sex difference in personality pattern is noteworthy here. Compared with men in general, the male in data processing is significantly more self-assured and self-confident, projecting a high degree of optimism about his ability to do a job.

The women systems engineers, on the other hand, do not differ from the average woman. Since, in our society, women in general tend to have less self-confidence than men, it is somewhat disturbing that these very intelligent, dedicated and achievement-oriented women, who are atypical in so many ways, would not also stand out in self-confidence.

The findings suggest the need for workshops to develop self-confidence and to bring women's feelings about themselves more closely in line with their abilities.

Data on job satisfaction was obtained from the 1983 annual survey conducted by Computer Task Group. For the 113 female technical employees who responded to the anonymous questionnaire, a high degree of satisfaction (more than 70% of the responses) was found in areas consistent with the dominant trends in the women's personality. If the woman in DP can correctly be described as a person who seeks challenge, strives for achievement and values independence and responsibility, then the data suggests



How to make a good impression again and again and again
again and again and again and again and again and again
again and again and again and again and again and again
again and again and again and again and again and again
again and again and again and again and again and again

You can maintain the quality of the impressions you make with a ribbon from Curtis 1000. We supply every type you can imagine, to fit almost every word processing and small computer printer as well as office typewriter.

Single-strike ribbons. Long-lived multistrike film ribbons. Correctable ribbons. Colored ribbons. Ribbons to enhance the appearance of your communications and improve your office productivity.

Ribbons are but one of our mile-long list of products—forms, envelopes, magnetic media, letterheads, binders, and the like—that help you get the word from person to person, department to department, and company to customer.

In essence, we supply things to make business work. We've been at it for more than a hundred years.

1000 DIFFERENT PRODUCTS TO MAKE BUSINESS WORK

For samples, call your Curtis 1000 representative or write Curtis 1000 (CW-RIB2), 1000 Curtis Drive, Smyrna, GA 30080.

that the work itself fulfills these needs.

The women were highly satisfied with:

- The feelings of accomplishment they get from their jobs.
- The way their work makes use of their abilities.
- The opportunity to work independently.
- The chance to be creative and develop their own ideas about how to do the job.
- The freedom to use their own judgment and take responsibility for their work.

Another stereotype is that women are "better with detail" — an excuse to remain on the technician level.

However, as in most surveys of job satisfaction, compensation and advancement were the areas of lowest satisfaction.

There is a striking degree of agreement between men and women regarding what aspects of the job are satisfying and which are not. These results are congruent with the preliminary findings of Philip Kraft and Steven Dubnoff, who surveyed 677 software specialists in the greater Boston area [CW, Nov. 14, 1983]. Those investigators also reported no overall difference in job satisfaction between men and women and a high degree of job satisfaction with the software field in general.

A sample of women at Computer Task Group, Informatics General Corp., Walker Interactive Products and Xerox Computer Services also responded to a brief survey on the issues or concerns they felt were facing women in the computer field. Their responses are revealing.

At the nonmanagerial level, when asked about their concerns with job satisfaction issues, women consistently and typically replied, "No problems," or wrote statements such as, "This is the fairest occupation to women," "I see no difference between myself and men in the field," and, "The issues that face women are the same as those that face men in this industry."

Despite the steadfast belief of many in the fairness and equality of opportunity within the field and in their particular companies, there exists, nevertheless, a core of women whose experiences have led them to perceive their work situation differently and who openly express familiar reservations: "It's still a man's world, especially at the management level. Less competent men are acknowledged over more competent women." "I believe that there is some doubt as to whether or not experience and training carry as much weight for a woman for promotion to management." These concerns appear to be voiced more frequently by women at the higher technical or managerial levels of a company.

Some see the larger problems as residing not in their company's policies, which are judged to be fair to both sexes, but in the attitudes of particular managers who may block women's advancement. Others are concerned with the more general problem of societal stereotyping. "When I tell someone I'm in DP, they usually assume some sort of data entry job." Another stereotype is that women are "better with detail" — an excuse to remain on the technician level.

Women are especially aware of their credibility problems and the need for recognition and acceptance in the male-dominated business world. As one senior systems engineer stated, "Women face unique credibility problems when sent to work at customer sites. Many times the customer feels 'ripped off' for having to pay so much for an 'obviously' inferior technical mind. I don't think we have the tools to deal with this problem effectively."

Or, as one woman who has moved into marketing said, "Credibility was always a question, as for six of my 11 years, I was the only woman programmer or analyst on staff. I had to work harder to even approach the 'equal' ranks." Finally, one marketing representative said, "While I have not generally felt any discrimination, there sometimes is an undercurrent of, 'Who is this

Our multi-mode HERMES printers shake hands with all kinds of computers. Even some you've never heard of.

And for your IBM-PC™, we have created the fully compatible multi-mode HERMES PC-PRINTER 1.

Fully compatible with your IBM-PC™, tested with Easywriter™, Multiplan™, Lotus 1-2-3™ and other software packages, the HERMES PC-PRINTER 1 allows you to convert your personal computer to a heavy duty professional system. IBM-PC™ users who only pick the best will also appreciate:

Its speed. Bi-directional, shortest path printing. 200 cps Data, 100 cps Near Letter Quality (single pass).

Its resolution. Finest print quality available on a matrix printer. So good you can even print signatures. Bit mapping graphics in single, double and triple density modes.

Its quality. Swiss high quality construction. Very high reliability for heavy duty use.

Its versatility. Choice of printing styles with the complete IBM™ character set tables (226 chars.). Wide range of automatic sheet-feeders with 1 or 2 bins + envelopes, single document inserter, roll-holder and tractor.

Its ease of use. Plug'n play installation. Plug it in, switch it on yourself.

HERMES®
The impressive printers

Manufactured in Switzerland by HERMES PRECISA INTERNATIONAL, CH-1401 Yverdon.

HERMES printers are distributed in Austria, Canada, Cyprus, Finland, France, Greece, Jordan, Kuwait, Lebanon, Saudi Arabia, South Africa, Spain, Sweden, Switzerland, United Kingdom, USA, West Germany.

To receive a sample of the finest quality matrix print-out and additional information on the HERMES PC-PRINTER 1, please return the coupon below.

Please send me more documentation about your PC-PRINTER 1.

broad — and why does she belong here?' " Some training in how to handle these situations is needed.

Implications for training

I cannot write a blank prescription for workshops or training programs to address specifically women's issues. The professional, independent-minded women I have studied are not likely to find that route acceptable. Ambitious, competitive and desiring equal opportunity to develop and use their abilities, they are likely to argue that it is the men, and not the women, who need the training to be able to accept competent women technicians and managers as colleagues.

Nevertheless, the concerns the women voice — about being accepted, for example, or showing self-confidence, even when they lack it, or handling difficult managers — are real and need to be addressed in an appropriate context.

Obviously, to be effective or even attended, training must meet the needs of its audience. Women in data processing see themselves first and foremost as professionals in their field. They seek and value professional autonomy and are committed to and identify with the data processing profession. They pride themselves on their technical knowledge and ability and want to be recognized and rewarded on those grounds. Training that segregates them by sex or calls attention to their gender detracts from their occupational self-image.

A technical manager at one computer service company advised, "Do not get hung up on being a woman." And advice from another one: "Don't wear feminist colors on your sleeve. Most people resent it." What counts is being the best at what one does; being a woman in the data processing field is not an issue they want to address directly.

What kind of training do women in DP want? Technical training, first. Developing and maintaining a substantial skill level is the prerequisite for advancement. Second, a solid base of business-oriented knowledge. In doing applications work in the computer service field, systems analysts need a broad business background in order to move freely in and out of different industries such as banking, insurance and manufacturing. Third, management education. Many who work in data processing perceive management as their career goal. They want training in general principles of management, specific training in their particular company's business and sales training.

Given these priorities, then, where is the place to address the undercurrent of issues affecting women in DP? The professional associations in the computer services industry would be an acceptable and appropriate sponsor of workshops and training for their members.

Within the context of professional development but away from the constraints of a particular company environment, women could learn constructive ways of handling problems such as credibility, stereotyping, lack of self-confidence and male chauvinist managers. These workshops might best include experiential activities such as videotaped role-playing sessions in which the participants could examine and experiment with their style of verbal and nonverbal presentation.

Some of the women's concerns fit into the category of communication skills and could be improved through in-house training offered to management candidates of both sexes. Within their own companies, management increasingly is recognizing that both men and women in data processing have emphasized technical training, perhaps at the expense of developing their interpersonal skills.

Yet, for the manager, interaction is a critical aspect of the job. Women who aspire to managerial careers may already have an advantage over men in the area of social skills but can benefit, too, from additional training in human relations skills. For both sexes, learning to communicate in a nondefensive way, to listen empathetically and express oneself openly and honestly — with superiors, subordinates and peers — is a first but important step in addressing business issues.

Subject data bases prescribed for application portfolio ills

By Paul Gillin
CW Staff

BOSTON — Are the following statements true for your application portfolio?

- Development of new applications requires no modification of old applications.
- Data for new applications is largely predefined in old applications.
- Existing data bases need not be significantly restructured for new applications.
- There are few timing difficulties for installing new applications.
- Applications last a long time.

If so, do not bother to finish reading this article. But if your DP shop is like most, your application portfolio contains a lot of redundant data held together by a fragile web of interconnections. You would perhaps do well to consider restructuring that data into subject data bases.

That was the message of Ron Ross, editor of the "Data Base Newsletter," in a talk at TSI International's Information Exchange conference held here recently. Data base architectures should mirror the activities of the business, Ross said. But unfortunately, the data bases at many companies have evolved without much rhyme or reason.

The problem occurs in an application-oriented environment in which each application has a specifically defined data base, Ross said. Because data that is used by one application is not optimized for access by another, developers tend to copy and redefine pieces of the data base to make them usable. The resulting systems often contain significant amounts of redundant data and process-heavy methods like cross-file indexes, transaction files and

Shopping for an application generator

By Steven Pfrenzinger
Special to CW

If you've been shopping for an application generator for IBM's IMS DB/DC or CICS/DL/1 lately, you may have noticed that the market is cluttered with vendors, all promising to have the solutions to your application backlog. The problem is that most of these productivity tools are currently unable to handle all of the processing situations (for example, simple through complex, low and high volume) represented in the backlog or are burdened with design restrictions (for example, screen or transaction flows) that limit their functionality. These tools also present learning curve and programmer acceptance problems that have threatened to turn some data processing organizations upside-down.

If you include concerns about the maintenance or conversion of existing systems, the problem gets even stickier. With most of your DP budget going to maintenance, a tool that only aids in new development does not really address the major issue.

Realistically, only a few of the applications generators available today are likely to gain general acceptance and mature to the point that they will address all of the varied applications waiting to be built or modified. As a result, a shakeout in the application generator market over the next two to three years can be expected. This means that buyers

Distributing data: What you can do

The topic of distributed data base is one that appears occasionally in the trade press and on conference programs, but always with that ethereal quality that is attached to unrealized technologies. What is it, and why should you be concerned about it?

Technically, we are still a few years away from a viable environment that allows data to be distributed between — and used interactively by — both central and distributed nodes. Certain data base management systems, like Cullinet Software, Inc.'s IDMS/R, have some distributed capabilities, but not in real time, according to Robert Holland, president of Holland Systems Corp., a consulting and education firm based in Ann Arbor, Mich.

Holland said the industry has traveled about halfway toward the goal of distributed data bases. The rest of the road harbors some serious hurdles of both the technical and organizational kind.

For example, if you have separate pieces of your corporate data base divvied up between various departmental computers, what do you do about security? Data validation? Diverse data structures? What if more than one user wants to access a departmental data base at the same time? How do you handle the problems that arise if one node is down for a week?

These are issues that the vendors will have to work out, but you can begin to tackle an equally important issue right now: Figure out how your organization uses information and how it will use it when the information no longer resides in a single location.

The major organizational problem, as Holland sees it, arises from the multitude of data structures that have evolved in

Stratus offers Unix implementation for mainframes

MARLBORO, Mass. — Stratus Computer, Inc. has introduced its own implementation of the AT&T Unix operating system for its Stratus Continuous Processing series of fault-tolerant mainframes.

USF (Unix System Facility) is integrated with the Stratus VOS operating system at the kernel level, the company said. The integration allows Unix operations to use VOS capabilities that are designed specifically for the Stratus systems.

USF contains standard Unix System V features including the C language, shell, commands and applications, system calls and subroutines, productivity tools and program utilities. Because of the integration with VOS, existing Unix applications can be ported to the fault-tolerant system without major customization, a spokesman said.

Facilities available in VOS are also available for Unix. These include demand-paged virtual memory, indexed files, record locking, access-control lists and transparent networking. Both Unix and non-Unix applications can access the complete set of available Stratus software. Features are invoked using normal Stratus subroutine calls through any language supported by the computer.

Components include:

■ A C compiler that supports the latest features of Unix System V and allows Unix applications to run with little or no modification. The compiler is also compatible with applications written in other standard Stratus languages.

■ Shell Command Interpreter. The shell is the main interface to USF. It is a ported copy of the Unix shell with extensions that allow access to VOS commands.

■ Stratus debugger. This has been extended to handle C programs and improved to cover "pipelined" programs under Unix.

■ File system. The networkwide file system is based on VOS's distributed directory hierarchy structure. This allows a large number of files and directories to be grouped for access by VOS- or Unix-based applications. It reportedly includes multiple indexing, record locking and transaction protection while preserving Unix compatibility.

USF users have access to the full line of fault-tolerant networking and communications options supported by Stratus systems. These include IBM's Systems Network Architecture, X.25 and X.29 terminal support, the Stratalink local-area network and Stratanet wide-area network.

The Unix implementation will be available in March. The C compiler costs $7,500. USF for one to 16 users costs $8,000. Prices increase according to the number of users to $32,000 for 65 or more.

Stratus is located at 55 Fairbanks Blvd., Marlboro, Mass. 01752.

Imagine.' Expand the way you think about information retrieval. It's the only query and reporting system built for CICS with: Entirely menu-driven architecture • Integrated on-line and batch query and report writing • Comprehensive system-managed control of CPU resources and data security. • Integration of production files into an on-line informational data base. For more information, call (617) 547-8050.

TSI Conductor boasts control for MIS

WILTON, Conn. — TSI International has announced an information center product that reportedly allows MIS departments to control the transfer of production data to end users while providing data integrity and security.

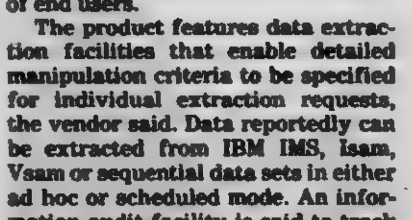
Called Conductor, the mainframe-resident package is not specific to any software package or data base, the company said. Conductor is driven by an active, self-populating dictionary that can be loaded from existing data base schemas. Menus are employed to allow maintenance and query facilities to be used.

Conductor also identifies data extraction requests and checks for security breaches, the vendor said. The dictionary is said to store information on source data base environments, data migration requirements and constraints and security profiles of end users.

The product features data extraction facilities that enable detailed manipulation criteria to be specified for individual extraction requests, the vendor said. Data reportedly can be extracted from IBM IMS, Isam, Vsam or sequential data sets in either ad hoc or scheduled mode. An information audit facility is said to track all access requests, data migration and reports extracted from the corporate mainframe.

Designed for IBM mainframes under IBM's MVS operating system with TSO and ISPF, Conductor ranges in price from $30,000 to $50,000.

TSI is located at 187 Danbury Road, Wilton, Conn. 06897.



IF AT FIRST
YOU DON'T SUCCEED—
TRY, TRY
FINDING THE BUG.

Uccel offers link to its financial tools

DALLAS — Uccel Corp. has announced Perfect Link, a microcomputer-to-mainframe link that provides access to the company's mainframe financial and accounting applications packages.

According to a Uccel spokesman, Perfect Link was designed to link the IBM Personal Computer, Personal Computer XT, 3270 Personal Computer and compatible systems to all Uccel financial and accounting applications as well as IBM Vsam data bases, with selective data selection and downloading capabilities. The link is said to work with a variety of micro spreadsheet packages, including Context Management Systems, Inc.'s Context MBA, Lotus Development Corp.'s 1-2-3, Ashton-Tate's Framework and Microsoft Corp.'s Multiplan.

The link ensures data integrity through security controls and audit trail capabilities that provide control over who can retrieve data, what data may be retrieved and when it can be accessed, a spokesman said.

Uccel is currently offering a 30-day free trial period for Perfect Link and a $15,000 license fee. Following the special offer, the cost for Perfect Link will range from $20,000 to $30,000, depending on mainframe configuration.

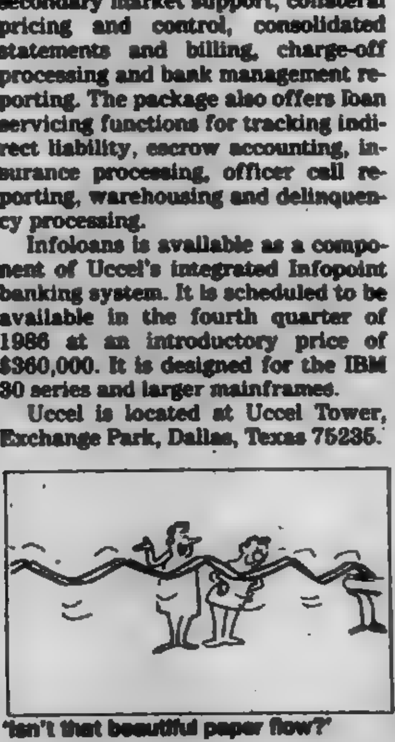
Loans management system

In addition to Perfect Link, Uccel announced a consolidated loans management software system — Infoloans — that combines mortgage, commercial, consumer and dealer floor plans into one package. The real-time, menu-driven system is said to provide full relationship lending for bank customers and total portfolio management for bank managers.

Major features of Infoloans include on-line collection capabilities, multiple-level and umbrella commitment processing, investor servicing, secondary market support, collateral pricing and control, consolidated statements and billing, charge-off processing and bank management reporting. The package also offers loan servicing functions for tracking indirect liability, escrow accounting, insurance processing, officer call reporting, warehousing and delinquency processing.

Infoloans is available as a component of Uccel's integrated Infopoint banking system. It is scheduled to be available in the fourth quarter of 1986 at an introductory price of $360,000. It is designed for the IBM 30 series and larger mainframes.

Uccel is located at Uccel Tower, Exchange Park, Dallas, Texas 75235.



'Isn't that beautiful paper flow?'

Forte Data product ties IBM micro, host

SAN JOSE, Calif. — Forte Data Systems, Inc. has announced Ecomnet, a micro-to-mainframe communications product that reportedly allows IBM Personal Computer users to access data and facilities on an IBM host through IBM PC-DOS commands. All functions of Ecomnet are said to be transparent to the user, including logon.

Ecomnet operates on IBM mainframes with either an IBM MVS 3.8, MVS/SP or VM/SP operating system. Micros are attached to the host via coaxial cable through IBM 3270-type control units. The Personal Computer must be equipped with either of Forte Data's emulator boards, the PC78-2 or the Forte-PJ card, and at least 256K bytes of memory.

A company spokesman said the initial release of Ecomnet consists of two elements. Ecomnet Virtual Peripherals (VP) offers a virtual hard disk approach that provides the user with up to 32M bytes of predefined on-line storage on the mainframe. Ecomnet VP also provides the user with access to host printer capabilities.

In the guise of locally stored files

The second element of Ecomnet, the Cross System Link, permits mainframe data files to be called from the micro as if they were locally stored files. The component differs from VP in that a user can access any standard operating system file on the host within limits defined by MIS. Mainframe file access or transfer is accomplished by using the PC-DOS copy command followed by the name of the host file.

The VP portion of Ecomnet is currently available and the Cross System Link is scheduled to be available in the first quarter of next year. Pricing for Ecomnet includes an $8,000 initial license fee plus a $500 monthly license for VP and a $300 monthly license for Cross System Link. The product can also be purchased for $30,000.

Forte Data Systems is located at 2205 Fortune Drive, San Jose, Calif. [illegible]

THE HARDEST-WORKING DBMS A CORPORATE HEAVY COULD ASK FOR.

You may not work for a global business with four billion customers and the world's biggest inventory.

But you can still give your executives an easy way to get at corporate data through their PCs. Without your getting snowed under with requests for information.

It's the new R:base™ 4000 Version 1.1.

"THE MORE PROGRAMMING CAPABILITY, THE MERRIER."

The new R:base offers greatly expanded programming capability that lets your users do conditional processing. Post transactions. And update multiple files from one input form. There's even a new applications diskette, with sample mailing list, inventory management, and prospect management applications.

Of course, R:base still lets your managers tap billions of records. Open 40 files at the same time, and handle up to 400 fields. And sort it all out before they know it.

"THE EASIEST DBMS SOUTH OF THE POLE."

The self-guided tutorial makes learning—and using—R:base a snap. Especially when it's combined with Clout,™ a software program that lets users ask questions of the database in their own words.

The result? You'll spend less time training managers and more time doing the bigger, more DP-intensive jobs.

"AVOID THE RUSH. CALL NOW FOR A DEMO."

If you'd like to try R:base, we'll send you a full demo/tutorial (with Clout as well) for only $14.95 plus shipping. Just call 1-800-547-4000, Dept. 937. In Oregon, call 1-503-684-3000, Dept. 937. Or see your nearest software store.

And show a corporate heavyweight how he could be sitting pretty.

R:BASE™
FROM MICRORIM™

Requires 256K of memory. Runs on MS™-DOS, PC/DOS™, [illegible]™ and CTOS™ operating systems.

D&B announces Nomad2 dictionary, interfaces, CBT

Enhanced applications development, accessing capabilities touted

WILTON, Conn. — D&B Computing Services, Inc. has announced a series of products based on its Nomad2 fourth-generation language.

According to a spokesman, the Nomad2 Data Dictionary ($5,000) is an interactive, menu-driven system that enhances applications development in Nomad2.

Among the product's features are the ability to create schemata for use outside the Nomad2 Data Dictionary, a report builder for simplified ad hoc data analysis, the ability to accommodate descriptions of external files that interface with Nomad2, including IBM's Isam, Vsam, Qsam, SQL and IMS, and the ability to resolve nested program calling sequences for up to 64 levels, the spokesman reported.

The company also announced a full-function interface between Nomad2 and IBM's SQL/DS ($10,000). The interface is said to allow end users to use Nomad2 to describe, maintain and report from an SQL/DS data base.

Among the capabilities the interface offers are complete read and write access to SQL data base tables, forward and backward movement within an SQL/DS table, in-place record deletion or modification using Nomad2 commands and an SQL-to-Nomad2 conversion feature acitivated by a simple utility, the spokesman said.

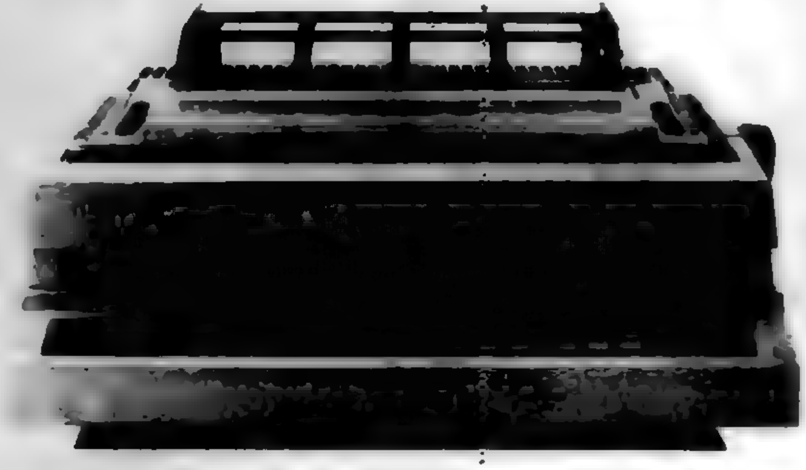
The company also introduced an IBM IMS interface ($6,000). The spokesman said information in IMS data bases can be accessed by IBM TSO users through the reporting capabilities of Nomad2.

The Nomad2/IMS Interface offers report preparation using Nomad2's List command, built-in functions for summing, counting, averaging, totaling and calculating percentages, more than 140 functions for handling statistical and financial reporting requirements and the ability to perform "what-if" analyses and consolidations within a single environment, the spokesman said.

Finally, the company announced a computer-based training (CBT) option (for approximately $15,000) to Nomad2 that reportedly offers end users hands-on instruction in the use of Nomad2. The Nomad2 CBT option runs under both IBM's VM and MVS operating systems and allows end-user access either through standard terminals or through an IBM Personal Computer.

D&B Computing Services is located at 187 Danbury Road, Wilton, Conn. 06897.

When It Comes To Daisywheel Printing,
Get The Best, Get A Diablo



Having over 200 printstyles and printing at 40 CPS, the Diablo 630API gives you the tops in letter quality printing.

And since it is compatible with most any microcomputer, you can be assured it will fit nicely into your work environment.

So if you are looking for the best in daisywheel printing, look for a Diablo printer from Data Access Systems, Inc.

As a leader in the sale, lease and service of quality computer and peripheral products, DASI stands ready to serve you from any of its nationwide sales and service locations. For more information contact Data Access Systems, Inc., Coles Rd. & Camden Ave., Blackwood, NJ 08012, 1-800-[illegible], in NJ 1-800-624-1206.

Diablo is a trademark of Xerox Corporation.

DAS
DATA ACCESS SYSTEMS, INC.

Geisco adds WPXchange to Quik-Comm

ROCKVILLE, Md. — General Electric Information Systems Co. (Geisco) has announced WPXchange, an information storage, retrieval and translation capability that reportedly allows dissimilar word processors and personal computers to exchange documents.

The service is offered as part of Geisco's Quik-Comm teleprocessing network.

The software is initially available for Wang Laboratories, Inc. VS and OIS systems and for IBM Displaywriters and IBM Personal Computers running Multimate International Corp.'s Multimate word processing software.

WPXchange has a global document storage and retrieval capability, a document translation capability and a link to Quik-Comm's electronic mailbox service. When connected with Geisco's worldwide network, documents can be stored, retrieved and exchanged between dissimilar equipment, said Ruann E. Pengov, general manager of GE's Office Communications Operation.

Geisco will also make the Quik-Comm network accessible to telex users in December.

A WPXchange user would pay $1.50 to transmit the first page of 1,000 to 3,000 characters with a translation charge of 50 cents and $1 for additional copies.

Geisco is located at 401 N. Washington St., Rockville, Md. 20850.

SYSTEMS SOFTWARE

JOINER ASSOCIATES, INC.
Jnet Version 1.1

Joiner Associates, Inc. has released Version 1.1 of its networking software product, Jnet, which allows users of Digital Equipment Corp.'s VAX-11 machines running under DEC's VMS operating system to exchange files, electronic mail and real-time messages with IBM's VM/CMS operating system users.

Version 1.1 works with DEC's Decnet local- and wide-area network and

IBM's Remote Spooling Communications Subsystem (RSCS) networking programming product. This release can use any Decnet connection for RSCS links between VAX-11 computers. Only one VAX-11 on a Decnet network needs a physical link to an IBM system.

Until Dec. 1, prices of the Jnet Version 1.1 range from $2,500 to $6,500 for DEC's VAX-11/725 through VAX-11/785.

Joiner Associates, P.O. Box 5445, 732 N. Midvale Blvd., Madison, Wis. 53705.

VM PERSONAL COMPUTING, INC.

Relay/TSO

VM Personal Computing, Inc. has announced a mainframe communications package that allows file transfer between IBM mainframes running under IBM's MVS/TSO operating environment and IBM Personal Computers and compatibles or Wang Laboratories, Inc. personal computers.

Used in conjunction with the VM Personal Computing's Relay software, which runs on the Personal Computer, Relay/TSO is installed on the mainframe to allow uploading and downloading of files of any length and format over asynchronous telephone lines, with error detection and correction in both directions.

Relay/TSO will be available Dec. 1 and is priced at $4,995.

VM Personal Computing, 475 Fifth Ave., New York, N.Y. 10017.

TANDEM COMPUTERS, INC.

Snax/HLS

Tandem Computers, Inc. has announced a high-level application interface for the company's IBM Systems Network Architecture Access Method (Snax) software that is said to reduce significantly the time required for users to develop application programs in the SNA environment.

According to a spokesman, the Snax/High-Level Support (Snax/HLS) software allows applications programs to be written without regard for the complexities of underlying SNA communications protocols.

The software is said to provide a comprehensive application interface for users of Tandem's Pathway transaction processing software and for non-Pathway systems. Snax/HLS provides the ability to communicate with a wide range of SNA intelligent controllers, such as the IBM 3600 and 4700 financial subsystems and IBM 3560 retail subsystems and IBM CICS and IMS software products, according to the vendor.

Snax/HLS is available for use on Tandem's Nonstop II and Nonstop TXP systems for a monthly usage fee of $250 per processor.

The software requires Snax software, which has a license fee of $2,750 per processor.

Tandem Computers, 19333 Vallco Pkwy., Cupertino, Calif. 95014.

INFORMATICS GENERAL CORP.

Micro/Answer for IBM 3270 Personal Computer

Informatics General Corp. has announced that its Micro/Answer micro-mainframe link series is available for the IBM 3270 Personal Computer.

The Micro/Answer series includes Lotus/Answer, Visi/Answer and Dbase/Answer, which are compatible with products from Lotus Development Corp., Software Arts, Inc. and Ashton-Tate, respectively. They reportedly support compatible execution under IBM's Application Program Interface.

Informatics General said users of Micro/Answer products can now download data from an IBM mainframe data base to the IBM 3270-PC. A configuration consisting of an Answer/DB module for a single mainframe site and 50 Lotus/Answer or Dbase/Answer systems for the 3270-PC costs $42,500 or less, depending on the micro systems purchased.

Micro/Answer will be available Jan. 23, 1985, according to the company.

Informatics General, 21031 Ventura Blvd., Woodland Hills, Calif. 91364.

JACKSONVILLE SOFTWARE SERVICES, INC.

Remote Data Entry

Jacksonville Software Services, Inc. has announced a version of its Remote Data Entry (RDE) system.

This package is designed for use with the full line of Burroughs Corp. large systems from the A series to the B7900 running under Burroughs' Gemcos operating system. Written in the Algol language, the system enables users to provide data entry capability with any of the Burroughs family of terminals from the TD800 through the ET series, a vendor spokesman said.

System generation is provided through Burroughs' Cande command and edit system. Features of the RDE system reportedly include a full range of edits and data control capabilities, and backup and recovery capabilities.

Remote Data Entry is priced at $7,500, which includes the first year of maintenance.

Jacksonville Software Services, 790 B N. Ponce de Leon Blvd., Saint Augustine, Fla. 32084.

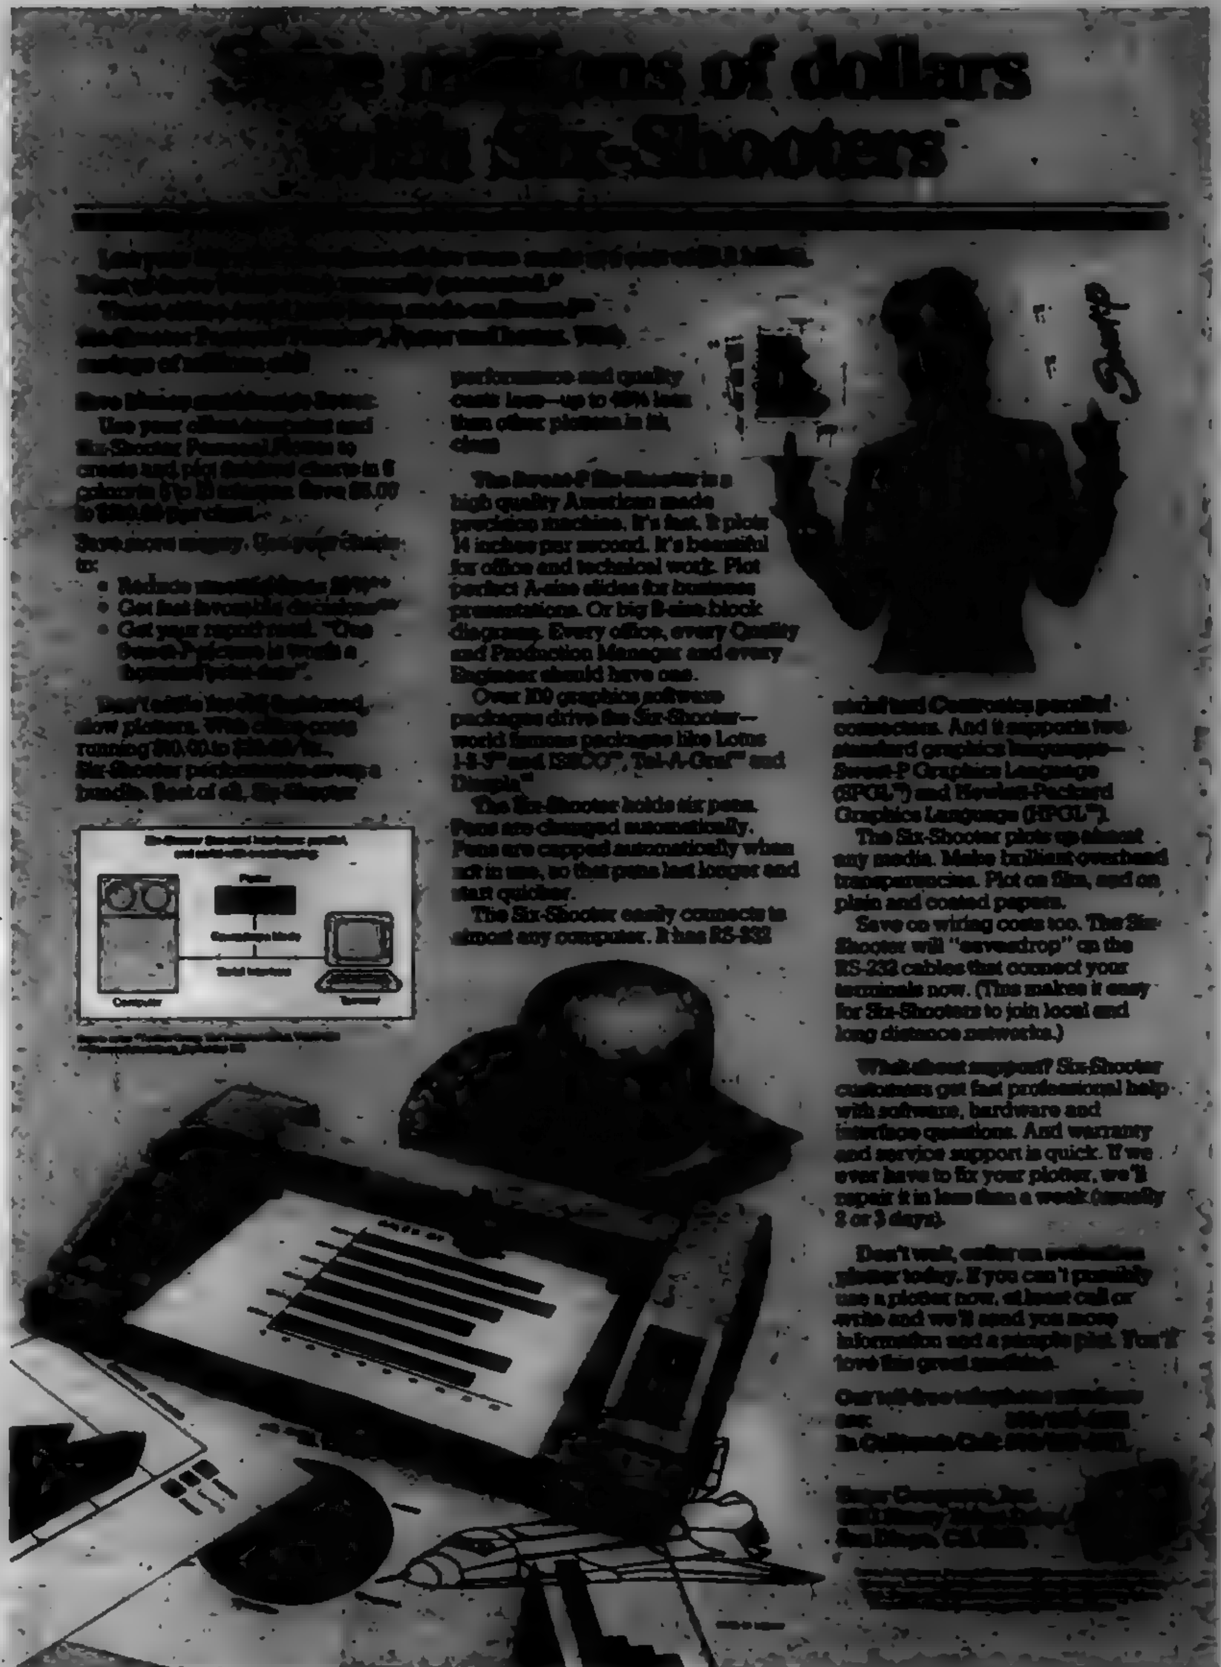
SYSTEM SUPPORT PRODUCTS, INC.

System/36 RPG Library Access Subroutine enhancement

System Support Products, Inc. has modified its IBM System/36 RPG-II Library Access Subroutines package.

According to the company, the package consists of two assembler-written subroutines designed to be linked to the System/36 RPG-II programs, providing direct access of Sys-

Continued on page [illegible]



[illegible] of dollars with Six-Shooters

[illegible]

performance and quality costs less—up to 40% less than other plotters in its class.

The Sweet-P Six-Shooter is a high quality American made precision machine. It's fast. It plots 14 inches per second. It's beautiful for office and technical work. Plot perfect A-size slides for business presentations. Or big B-size block diagrams. Every office, every Quality and Production Manager and every Engineer should have one.

Over 100 graphics software packages drive the Six-Shooter—world famous packages like Lotus 1-2-3™ and ISSCO™, Tel-A-Graf™ and Disspla™.

The Six-Shooter holds six pens. Pens are changed automatically. Pens are capped automatically when not in use, so that pens last longer and start quicker.

The Six-Shooter easily connects to almost any computer. It has RS-232 serial and Centronics parallel connectors. And it supports two standard graphics languages—Sweet-P Graphics Language (SPGL™) and Hewlett-Packard Graphics Language (HPGL™).

The Six-Shooter plots on almost any media. Make brilliant overhead transparencies. Plot on film, and on plain and coated papers.

Save on wiring costs too. The Six-Shooter will "eavesdrop" on the RS-232 cables that connect your terminals now. (This makes it easy for Six-Shooters to join local and long distance networks.)

What about support? Six-Shooter customers get fast professional help with software, hardware and interface questions. And warranty and service support is quick. If we ever have to fix your plotter, we'll repair it in less than a week (usually 2 or 3 days).

Don't wait, order an [illegible] plotter today. If you can't possibly use a plotter now, at least call or write and we'll send you more information and a sample plot. You'll love this great machine.

[illegible]

SOFTWARE & SERVICES

Continued from page 89

tem/36 libraries from within a program. Source and procedure member read/write functions are said to be supported.

The modification level of the program is immediately available and carries a one-time license charge of $395.

Current licensees pay only a mailing and handling fee, the vendor said.

System Support Products, 7620 Arlen St., Annandale, Va. 22003.

CORNERSTONE SOFTWARE SYSTEMS
Disquick/32

Cornerstone Software Systems has announced Disquick/32 software, a series of enhancements for the file managers in Perkin-Elmer Corp.'s 32-bit superminicomputers running under PE's OS/32 operating systems. The product is compatible with PE's current R07-02 revision of OS/32.

Disquick/32 is said to eliminate overhead and wait states in the file managers. System performance becomes a function of the speed of the processor, rather than a function of disk access time, according to a spokesman. The product reportedly eliminates unallocated disk space.

Prices of Disquick/32 range from $2,000 to $7,000, depending on the processor.

Cornerstone Software Systems, P.O. Box 148, Murrysville, Pa. 15668.

SOUTHERN SYSTEMS, INC.
Mercurion Printer Management Facility

Southern Systems, Inc. has announced the Mercurion Printer Management Facility (MPMF) graphics software module. MPMF was designed for use with a forms overlay buffer on the Mercurion 1 electronic printer, which prints at the rate of 60 page/min.

MPMF is said to allow users to create and store output forms, then call them up for printing as part of a typical applications output. Users can create a form using a range of alphanumeric settings, varying densities of lines and shading and graphics including logos and signatures, the vendor said.

The price of MPMF is $5,000, and the support charge is $200/mo, the company said. The price for the Mercurion 1 printer is $65,950.

Southern Systems, 2841 Cypress Creek Road, Fort Lauderdale, Fla. 33309.

PRODUCTIVITY AIDS

DBMS, INC.
DL1/Online

DBMS, Inc. has announced DL1/Online, a full screen, interactive productivity aid for users of IBM's IMS.

A spokeswoman said DL1/Online allows users to access an IMS data base, view its contents and structure and create, fix, modify, add and delete information on-line.

The package is said to support IMS DL/1 commands, and it reportedly reduces the need for users to work within the confines of batch processing or to write special, single-purpose programs to access and manipulate IMS segment data.

For application development, DL1/Online can verify data base calls and test search strategies, the spokeswoman said.

DL1/Online reportedly features overtype data in either hexadecimal or character portions of the screen, the capability to scroll through segments by line or page with single-key commands and the ability to equate lengthy segment search arguments with symbolic labels to eliminate keystrokes.

DL1/Online runs with IBM's IMS/VS under CICS or TSO and with DOS/DL/1 under CICS. It may be licensed for $5,900.

DBMS, 1801 Mill St., Naperville, Ill. 60540.

AMERICAN

SOFTWARE AG

The innovator sets the standard with perfect vision.

In the 1970's we developed a system to provide data independence—before there was such a thing as a relational data base.

Next, we introduced a high productivity programming language for developing applications in an on-line data base environment—before there was such a thing as a fourth generation programming language.

In both cases we anticipated a trend, and delivered a product to meet a need before it was even defined by the industry.

We didn't just stop there.

We recognized the importance of maximizing worker productivity at a time when others were concerned about the high cost of machines. That's why we are the first to present an integrated series of products that use the same language.

We identified the need for a high volume product for VAX machines—while most still considered the DEC-VAX equipment only for low volume, low capacity applications.

We saw the necessity of having many machines working in coordination and developed our family of networking products to support this trend.

We realized the requirement for true distribution of data, so we carefully integrated data communication capabilities with our data base software.

By listening to our users, we anticipated the growing importance of 24-hour-a-day access to data. As a result, we now offer the first nonstop data base.

Today, while others are busy putting labels on our innovations, we are quietly moving on to our next innovation. And, that's the proper plan for the world leader in advanced systems software.

How can you be sure that your company will be ready for the challenges of tomorrow? Call us today.

GT SOFTWARE, INC.
BMS/GT Release 4.8

GT Software, Inc. has announced the availability of Release 4.8 of BMS/GT, its screen generator for IBM 3270 terminals running under IBM's CICS.

A Help screen processor/tutorial and an IBM Development Management System (DMS) conversion aid have been added to the package. According to the company, Tutor/GT is a tutorial facility for any new or existing application. It reportedly can be implemented without any changes to existing programs.

The DMS conversion aid is said to allow an installation to convert DMS panels to standard BMS screens.

BMS/GT is compatible with any release of CICS 1.4 or higher. The base permanent license for the BMS/GT is $5,500 for IBM's VSE and $6,900 for IBM VS/1 and MVS operating systems.

GT Software, 4411 E. Jones Bridge Road, Norcross, Ga. 30092.

APPLICATION PACKAGES

ISSCO, INC.
Iviss Megacalc

Issco, Inc. has announced the addition of the Mega Group, Inc.'s Megacalc mainframe spreadsheet to its Iviss visual information system software. Megacalc can also accept microcomputer spreadsheets uploaded from Lotus Development Corp.'s 1-2-3, Software Arts, Inc.'s Visicalc and Computer Associates, Inc.'s Supercalc.

According to a spokesman, Megacalc will also be linked to Issco's Tell-A-Graf graphics software. Both Iviss and Tell-A-Graf use IBM 3270-type terminals under IBM's MVS/TSO and VM/CMS.

With the addition of Megacalc, users of Iviss will be able to calculate and model data in spreadsheet format and communicate the data in graphics form, upload entire micro spreadsheet models to the mainframe, combine spreadsheets from various micros and move data from the mainframe to the micro via Issco's Data Connection software.

Megacalc is currently available at prices ranging from $19,000 to $24,000. Links to Issco software are set to be available early next year.

Issco, 10505 Sorrento Valley Road, San Diego, Calif. 92121.

RATH & STRONG, INC.
CSD/AML

Rath & Strong, Inc. has announced a computer-aided process planning package for industrial and process engineers to develop, compute, document and maintain production operator job standards. The package runs on IBM 30 series mainframes under IBM's OS/MVS operating system and on IBM 4300s under DOS.

Both mainframe versions run under IBM's CICS with Vsam files and Cullinet Software, Inc.'s IDMS data base and data communications environment. It also operates on any Data General Corp. minicomputer under DG's Rdos and AOS operating systems and on any microcomputer under Microsoft Corp.'s MS-DOS or IBM's PC-DOS operating systems.

The Computerized Standard Data/Advanced Machining Logic (CSD/AML) package finds the combination of feed and speed that will produce the required finish and make full use of the horsepower available on the user's lathes, mills, drills, grinders and gear cutters, a spokesman said. CSD/AML considers the material and finish of the workpiece, setup rigidity, tool geometry and material, interrupted cut, eccentric weight, steady rest, coolant, hand feeding, machine condition, horsepower and actual available speeds and feeds.

The price of the mainframe or minicomputer versions is $60,000; the microcomputer version is $30,000. Source code, consulting and technical assistance are included.

Rath & Strong, 21 Worthen Road, Lexington, Mass. 02173.

LELAND COMPUTER SERVICES, INC.
Leland Purchasing Control System

Leland Computer Services, Inc. has announced the Leland Purchasing Control System (LPCS) for IBM mainframes.

According to a spokeswoman, LPCS is an on-line, interactive purchasing system that allows a purchase order to be created using only three transactions. The system pulls standard input data from its data base whenever possible, eliminating the need to input redundant information.

Any purchase order can be amended, even after closing, and LPCS maintains a historic audit trail of all user changes. It can be tailored to work with any materials requirements planning data base. It is written in command-level IBM CICS, utilizes IBM's DL/1 and processes in IBM's OS and DOS environments. LPCS is priced at $22,500.

Leland Computer Services, Suite 146, 8601 Dunwoody Place, Atlanta, Ga. [illegible]

CANTON AUTOMATED SYSTEMS, INC.
On-Line Loan Service Card

Canton Automated Systems, Inc. has developed an automated loan service for financial institutions using the IBM 370, 4300 and 30 series mainframes.

The On-Line Loan Service Card reportedly runs with IBM's DOS/VSE operating systems, IBM's CICS/VS

SCHEDULING, NATURE'S WAY.

Our Scheduling System Does Something Nature Doesn't Do. It Schedules Jobs For MVS Environments The Same Day It's Installed.

With *ADC2, Automated Data Center* management information system, your company is just a day away from getting its computer operations under control. That's because Cambridge designed ADC2 to be fully productive the day it's installed.

ADC2 builds schedules and makes all data center management information readily available, ensuring increased control and throughput. It can also cut processing time by *more than 25%*.

Users find this high-performance system software simple to learn and easy to use.

ADC2 monitors all jobs automatically. Performance statistics are dynamically gathered and maintained as current and historical data for quick on-line access.

For even more convenience, a decentralized scheduling feature allows different departments and remote sites to simultaneously create and manage their daily job schedules with simple commands.

So if you're wrapped up in scheduling problems, find out how to emerge with more control over your data center's activities.

Call or write The Cambridge Systems Group. Ask for an on-site, on-line ADC2 demonstration *with your own data.*

Canton Automated Systems, 100 Central Plaza S., Canton, Ohio 44701.

PALETTE SYSTEMS, INC.
Palette Cadd software for Vaxstation I

Palette Systems, Inc. has announced that its Palette Computer-Aided Drafting and Design (Cadd) software now supports Digital Equipment Corp.'s stand-alone graphics workstation, the Vaxstation I, under DEC's MicroVMS operating system.

While viewing, drawing and modifying Palette files, the user can simultaneously plot a drawing or display a directory of drawings stored on disk. Palette provides an interface to DEC's LA50 and LA100 dot matrix printers.

The price for the Palette system is $9,999 for the two-dimensional module and an additional $2,500 for an optional three-dimensional module. An independent program interface costs $2,000.

Palette Systems, Two Burlington Woods Park, Burlington, Mass. 01803.

COLLIER-JACKSON, INC.
CJ/Advanced General Ledger update

Collier-Jackson, Inc. has announced that its CJ/Advanced General Ledger package now includes an updated allocation feature that is said to give users a choice of capabilities.

According to the company, the system, which is designed for Hewlett-Packard Co.'s HP 3000 minicomputers and Digital Equipment Corp.'s VAX-11 series, can automatically allot a sales tax expense for a department's percentage of the gross sales.

The time period can be determined by the customer.

A customer-defined processing sequence reportedly allows CJ/Advanced General Ledger to allocate according to a previous allocation procedure.

An $18,000 license fee for the product includes object code, source code, on-site training, installation, user documentation, implementation plan, a 90-day start-up warranty and support.

Collier-Jackson, 3707 W. Cherry St., Tampa, Fla. 33607.

BURROUGHS CORP.
Burroughs Distribution Partner

Burroughs Corp. has announced a software distribution system for use on Burroughs B1000, B5000, B6000 and B7000 series mainframes.

Burroughs Distribution Partner is developed with the Linc language. According to the company, the package incorporates on-line documentation as well as Help screens.

The Base Module, which includes order entry, inventory control, accounts receivable, inquiry and management reporting, is available immediately for $22,500.

Burroughs, Burroughs Place, Detroit, Mich. 48232

MANCHESTER SYSTEMS GROUP, INC.
Manchester Reinsurance System CICS version

Manchester Systems Group, Inc. has announced an IBM CICS version of its Manchester Reinsurance System (MRS).

The CICS version is an online, interactive reinsurance processing system designed to meet the functional requirements of professional reinsurers, intermediaries and the reinsurance departments of primary companies.

It tracks reinsurance from the initial offering through binding to accounting, claims and retrocessions. MRS processes all forms of domestic and international reinsurance.

According to the company, prices range from $282,650 for the basic reinsurance assumed without submissions to $468,750 for the fully enhanced version. (All options come with participant-level retrocession.)

Manchester Systems Group, 8B, 395 South End Ave., New York, N.Y. 10280.

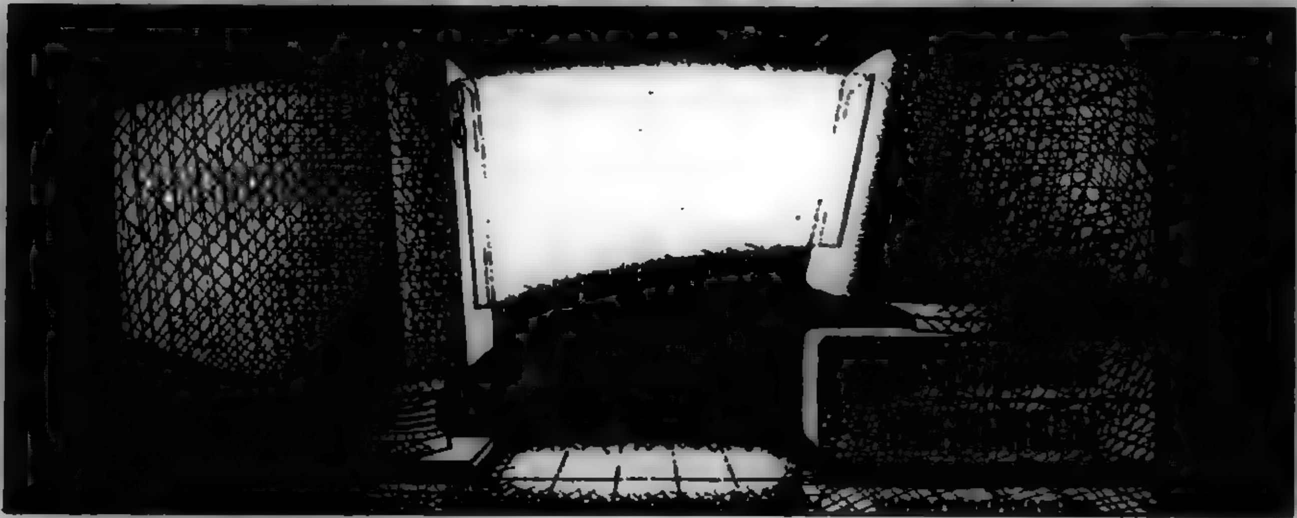
Now put your IBM® and WANG® word processors on speaking terms with each other.



Introducing the QUIK-COMM™ System WPXchange™—the global document translation, storage and retrieval service for word processors. GE Information Services proudly announces WPXchange, the newest feature of the QUIK-COMM System.

The QUIK-COMM System WPXchange acts as an electronic translator that permits documents created on one type of equipment to be easily accessed and edited by other devices in your company.

It increases productivity by eliminating the need to rekey data for dissimilar devices. It reduces operating costs by providing a cost-effective alternative to expensive courier services. It enhances an organization's effectiveness by providing easier access to critical documents needed for decision-making tasks.

Free Document Usage Analysis. At GE, our vast experience in markets worldwide has taught us how to solve business communication problems. We're helping others solve problems, too, including two-thirds of the FORTUNE 500 companies. And we're ready to help you.

To find out more about the QUIK-COMM System WPXchange and what it can do for you, just give us a call at 800-638-9636, ext. 2101. Or clip and mail the coupon.

You might qualify to receive a free document usage analysis from GE. If you qualify, we'll arrange for a GE representative to come to your site to discuss your information storage and retrieval needs and how to make your organization more effective.

It's free and there's no obligation. So call us today!

THE 10 MOST IMPORTANT QUESTIONS YOU SHOULD ASK YOUR SOFTWARE VENDOR

"Many questions you would ask prospective application software vendors don't differentiate one vendor from another. The similarities between suppliers are not what's important — it's the differences that count. Here are ten questions you should ask prospective application software vendors before making your selection."

—John C. Gable,
Vice President of
Corporate Systems and Technology
for American Software, Inc.

	AMERICAN SOFTWARE	OTHERS
1. Can the application software you are considering be easily delivered in a variety of data processing environments (operating system, teleprocessing monitor, and data base) to permit easy migration and allow system software environmental independence?	Yes	?
2. Can the application software be delivered for VSAM and all popular data base management systems, rather than being tied to the application vendor's data base system — one which could be outmoded by new data base products developed by another vendor in this rapidly-changing high-technology industry?	Yes	?
3. Is the application software implemented using a "native" or direct approach to the operating system, teleprocessing monitor, and data base manager, without the inefficiency associated with "bridges" or the vendor dependencies of a "black box" approach?	Yes	?
4. Is the application product coded in an efficient, widely-used, and industry-standard language such as COBOL, rather than a vendor-dependent language unknown to the general data processing community?	Yes	?
5. Can the application product be "tailored" or streamlined to meet the specific functional and operational needs of a company through purchase of a basic package and selected optional features, thereby avoiding delivery of useless code?	Yes	?
6. Does the vendor retain a source version of each customer's uniquely tailored application software for emergency backup, problem determination, and client assistance?	Yes	?
7. Does the vendor have a broad, completely integrated line of application software which can be demonstrated on a single system instead of merely described?	Yes	?
8. Have all of the vendor's products been integrated by design and developed by a single organization, thus eliminating the need for inefficient interfaces and unknown "black boxes" to tie together unrelated or acquired applications?	Yes	?
9. Does the vendor clearly demonstrate a full commitment to the complex business of application software, rather than offer an incidental addition to its main product line?	Yes	?
10. Has the vendor been in the application software business a minimum of ten years with a successful track record of sustained profits and a strong financial posture?	Yes	?

If the answers to these ten questions make a difference to you, then let us explain the other important differences — the functional differences. Not all solutions are alike!

TOOLS

from page 95

are faced with the tough decision of picking one of the likely survivors.

Let us define a few terms relevant to this discussion. The subject is application generators to be used by programmers to build applications under IBM's IMS/DC and CICS and that access IBM DL/1 data bases. These generators are for predefined production systems, which are often built in a development center, but never in an information center.

Let us also avoid the terms fourth- and fifth-generation languages. Rather, we are looking at tools that potentially offer substantial productivity gains over traditional development and maintenance methods.

Last, when we talk of maintenance, we are referring to enhancement and adaptive, but not corrective, maintenance. Enhancement maintenance usually involves adding new functions and adaptive maintenance involves a change in environment. Corrective maintenance usually involves programming errors missed during testing and found late by computer operators.

> *Choosing a Cobol-based tool can be seen as an interim decision that represents a gradual turn in the direction of the high-powered application generators.*

With the apparent failure of the early application generators to live up to their billing, DP organizations are finding it difficult to commit to a generator for the five- to seven-year life cycle of the developed application. The lack of performance of many generators is also an issue.

If your organization likes the leading-edge image, then being a pioneer in the current market may be appropriate. But, if you don't like being a pioneer, the safest decision may be to select a Cobol-based application generator that you do not have to commit to in the long term. The Cobol-based tools also generally do not have long learning curves.

Choosing a Cobol-based tool can be seen as an interim decision that does not turn your organization sharply in one direction, but represents instead a gradual turn in the direction of the high-powered application generators in today's market.

Most of the Cobol-based application generators come with basic screen and report painter features to simplify what the user views as inputs and outputs. Most also have a feature to simplify building a skeletal version of a program that delivers data from screen to program and back again. They also include field-edit logic which is usually defined in a nonprocedural fashion soon after the screen is painted.

With screen, reports and skeletal programs ready, you can add procedural logic such as after-edit logic and application-specific logic using variations of Cobol that include powerful data base and data communications commands. This procedural logic is then processed through a precompiler and expanded into a complete Cobol program, ready to compile, link and execute. Reasonably complete program documentation is usually generated somewhere within this process as well.

Add to this a complete disconnect of the generated source code that the application generator creates, and you can also avoid a long-term commitment to the tool and its vendor. The disconnect feature also gives you greater flexibility.

Until the market settles and the next generation of tools is available, a Cobol-based application generator for the IMS DB/DC and CICS/DL/1 environment appears to be the best interim decision for most DP organizations.

Admittedly, the debate over Cobol's future rages on. However, the fact remains that there is a huge base of trained Cobol programmers and plenty of existing and newly developed Cobol systems for them to work on. And, if we can make substantial improvements in productivity and still use Cobol, then maybe we can make an evolutionary, rather than a revolutionary, shift to the next generation of productivity tools.

MS-DOS is a trademark of Microsoft Corporation.
©1984 AT&T Technologies, Inc.

UNIX SYSTEM V. FROM AT&T. ON TOP

Is your company's computing system an unmanageable muddle of isolated workstations and departmental computers?

You need a flexible means to integrate your system and get it under control. UNIX System V from AT&T.

It's another reason why good business decisions are based on UNIX System V.

UNIX System V can help you regain control of your company's system. Its flexibility lets you organize and expand your computing system for maximum efficiency. And it protects your investment in hardware and software.

More freedom. More control.

UNIX System V is virtually hardware independent. It gives you the freedom to combine equipment from a variety of vendors. Even if the machines are of different generations.

You won't waste money rewriting software every time a new computer is added on. UNIX System V is easily adapted to a wide range of computers. From micros to mainframes. Including AT&T's range of 3B Computers.

Don't worry about your stand-alone personal computers running on MS-DOS.* AT&T's PC Interface allows you to integrate your current machines into your system without costly disruptive change.

And, our COMMKIT™ Software links UNIX System V to the major networking protocols for data communications between computers based on UNIX System V and those that are not.

UNIX System V can support a number of users doing varied tasks at the same time. All sharing a central processing unit and peripherals. All benefiting from a larger base of information. All working as a manageable whole. All contributing to bottom-line cost savings because equipment and computing

Selection criteria help in choice of applications generator

SOFTLINE

Use the following list of considerations to assist in the selection process for Cobol-based applications generators. Each consideration shown may be given a weighting factor — high, medium or low — depending on your organization's requirements:

- A screen image painter to generate the Message Format Services or Basic Mapping Support source statements. It should be interactive and easy to use when creating or modifying screens.
- A screen flow painter for screen control and prototyping.
- Early prototyping feature (for example, soon after screen design) that allows data to be entered on the screen, not just viewed in a simple simulation.
- A report image painter for batch reporting requirements.
- Commands or macros to simplify data base and data communications interfaces. They should also be modifiable for use by senior technicians.
- An option of a complete and simple disconnect from the applications generator for maintenance of the generated source code.
- No runtime package that would affect portability to multiple CPUs.
- A minimal learning curve for programmers who already know Cobol.
- Allowance for leveraging of experienced IMS DC, CICS and DL/I development.
- No significant design restrictions that limit functionality.
- Handling of high-volume/highly complex processing efficiently.
- Acceptance of copybooks from an existing data dictionary.
- Accommodation of major conversions, enhancements and adaptations of existing systems as well as new development.
- Handling of complex data bases; for example, logical relationships, secondary indexes, Fast Path and eventually IBM's DB 2.
- High recommendations from current customers.
- Ensuring that developers generate standardized Cobol source code that follows structured coding techniques. A precompiler, the actions of which can be adapted to your organization's standards is a help.
- Generation of systems that may potentially run in both IMS DC and CICS.
- Ability to use a microcomputer as a programmer workstation for at least some of the development process — for example, screen painting and prototyping.
- Good documentation.
- Comes from a stable and responsive vendor.
- Reasonable initial and recurring costs.
- Does the tool currently, or will it eventually, offer a migration path for existing systems?

Continued from page 94

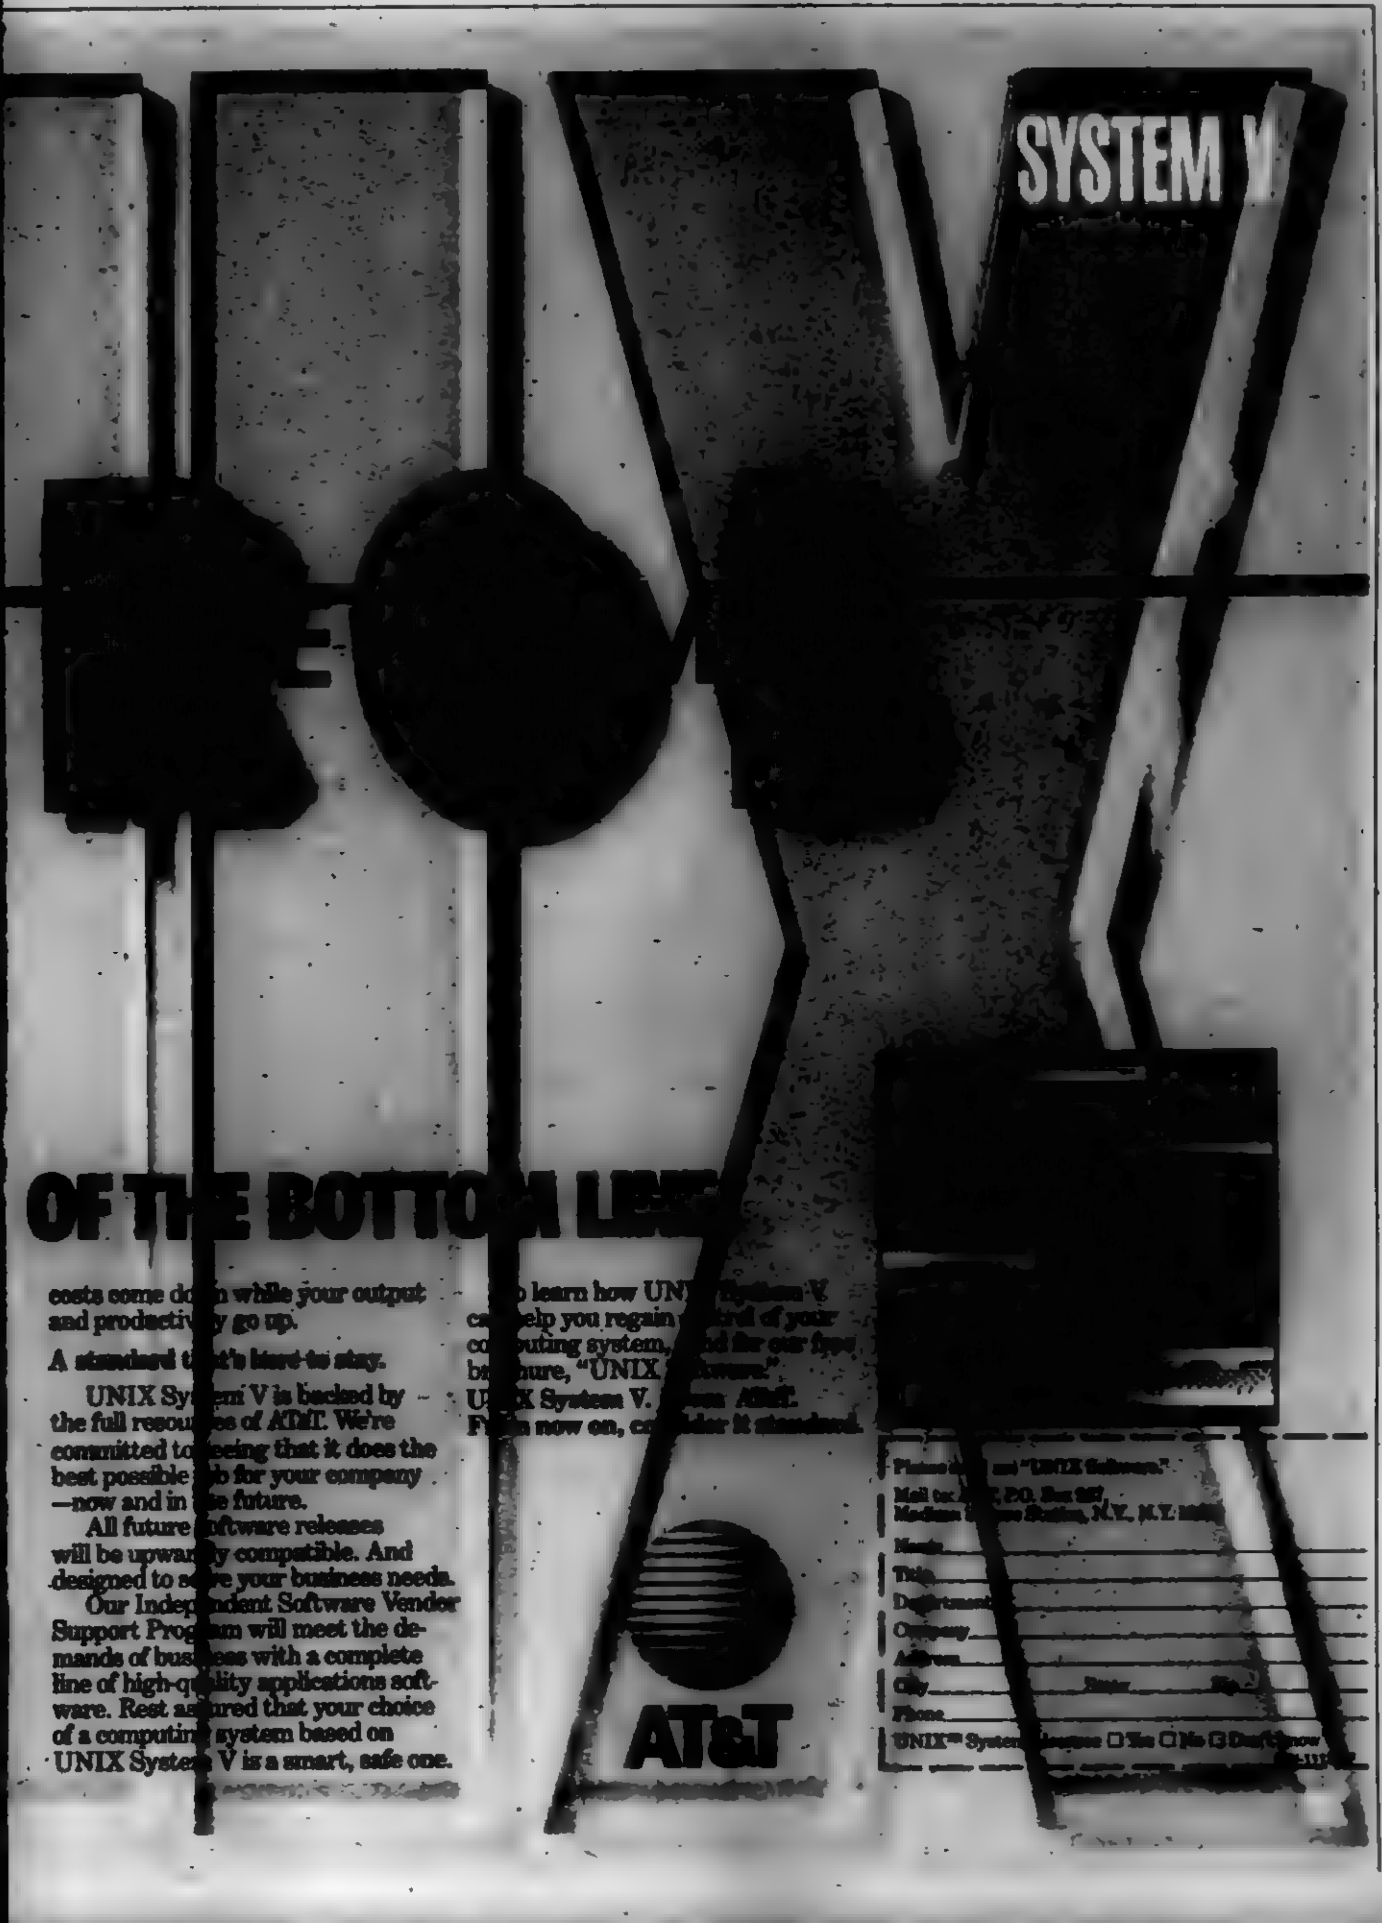
ries/37 minicomputer.

The system reportedly can handle all asset categories including options, futures, repurchase agreements, mortgages, fixed income securities and common stock.

The product's performance measurement subsystem is said to provide portfolio analysis and allows the user to select a daily rather than monthly cash weighting. User-defined tables and a report writer enable each firm to customize the system without extensive programming, the vendor said.

The software package for existing Series/37 systems costs $40,000. Turnkey installations are also available.

Greer Sontag Associates, 6 E. 45th St., New York, N.Y. 10017.



costs come down while your output and productivity go up.

A standard that's here to stay.

UNIX System V is backed by the full resources of AT&T. We're committed to seeing that it does the best possible job for your company —now and in the future.

All future software releases will be upwardly compatible. And designed to serve your business needs.

Our Independent Software Vendor Support Program will meet the demands of business with a complete line of high-quality applications software. Rest assured that your choice of a computing system based on UNIX System V is a smart, safe one.

To learn how UNIX System V can help you regain control of your computing system, send for our free brochure, "UNIX Software."

UNIX System V. From AT&T. From now on, consider it standard.

SUBJECT

from page 85

spin-off files to hold it all together.

Subject data bases are a way of defining one data structure that can be accessed by all applications. "Subject data bases represent discreet chunks of the data resource," Ross said. "[They have] to be highly integrated, sharable by multiple applications and used as a building block for the entire information architecture."

Subject data bases must be built from the ground up. More important, they have to be thoroughly planned. That up-front planning time can pay back handsomely, Ross said. If well implemented, subject data bases require little modification. Application development and installation time can be speeded dramatically and both CPU and disk space resources saved.

To plan for a subject data base, you first need to identify the discreet functions of your business. "We're basically looking for seams we can use to cut the data base into pieces," Ross said.

Look at the organization as a user of information and try to identify how data flows through it, he said. If you take that broad, functional view — sometimes called functional decomposition — a matrix will begin to emerge showing how data is used by various operations.

Start building the data base in pieces with a structure that can be accessed by other applications when needed. Your department's application development plan should revolve around your data base plan, Ross said. For example, build two subject data bases while creating an application that uses them. Your next application may require parts of both data bases plus a new one. If properly structured, you should only have to build the new data base to implement that application.

"When applications need to communicate, they draw from the subject data bases rather than from each other's application data bases," he said. As a result, the code needed for validation, manipulation and editing is also reduced.

Ross conceded that the most difficult aspect of organizing subject data bases may be political. Management is not accustomed to thinking of the company as a user of information and may be reluctant to approve the costs of development. DP managers can start the ball rolling by putting together a project team to analyze information needs and then presenting that, along with suggestions for improvement, to executives.

[redacted]

DATA

from page 85

most corporations. For example, the sales department knows its customers by corporation names, billing sees them as invoice numbers and production knows them in terms of the products they order. Thus each operation uses different keyed fields to look at the same data.

In many companies this spiderweb of views is held together by tenuous bridges that have been built between the files. In fact, Holland estimated that the average Fortune 500 company has 400 man-years invested in its data base and another 300 man-years sunk in the bridges between the records.

The most important requirement for achieving the promise of distributed data base is standardization. Compatibility is needed across hardware, data, application systems, networks and systems software, Holland said. "There are standards right now, but manufacturers aren't sticking to them," he said. But he added, "Ultimately the business world will demand them, and they will be achieved." In fact, certain vertical industries like air travel, banking and manufacturing have already defined a certain level of standardization within their companies.

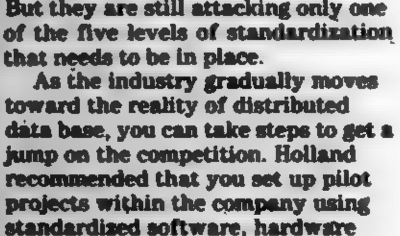
Establish standards

What data processing and corporate management in general can do is establish some standards for how data will be used and then test them. Multiple data base management systems (DBMS) are the wrong way to go, Holland said. Companies like Relational Technology, Inc. and Oracle Corp., which advocate standardizing on a single DBMS (theirs), are heading in the right direction, he said. But they are still attacking only one of the five levels of standardization that needs to be in place.

As the industry gradually moves toward the reality of distributed data base, you can take steps to get a jump on the competition. Holland recommended that you set up pilot projects within the company using standardized software, hardware and local-area networks. Evaluate the alternatives and see which ones are best for you. "The key is for companies to go with one standard and not three or four different ones," he said.

More important, MIS managers have to start thinking more like business people. As trite as that phrase now sounds, the success of distributed data base depends upon your willingness to learn how your company uses data.

Multiple-keyed fields will not be successful in the distributed environment of tomorrow. A personal computing environment that lets a hundred species of dissimilar flowers bloom will fail as well. You will have to lead your business into this new generation with the confidence that your data model is in tune with the company's business model.



'This is not a recording, but I have an excellent memory.'

COMMUNICATIONS

Enhancements out for AT&T's high-end PBX

Central processor redesign quadruples capacity, voice mail system debuts

By John Dix
CW Staff

NEW YORK — AT&T Information Systems has nearly quadrupled the maximum capacity of its high-end private branch exchange and introduced enhanced management capabilities, a voice mail system and higher speed data support for that switch.

Capacity enhancements to the System 85 were achieved by adopting a central processor that uses bipolar and bit-sliced technology, increasing cache and main memory to 32K bytes and 8M bytes, respectively, and using new software, said Bob Magnani, System 85 product manager. Previously limited to 7,000 lines, the expanded version of the switch can now support up to 32,000 standard analog telephones. By interconnecting systems using the company's distributed communications systems, up to 100,000 lines can be serviced, AT&T reported.

Voice/data workstation support has been increased from 5,000 to 8,000 devices, and the number of trunks the switch can support has been increased from 2,250 to 6,000. The processor can reportedly handle 45,000 busy-hour calls, whereas its predecessor could support only 20,000, Magnani said. With the Remote Group feature, some of these stations can be clustered at remote locations up to 100 miles from the central switch.

The enhancements will be made available in the first quarter of 1985 and will cost from $10,000 to $50,000, depending on the system configuration.

Also announced was the 3B5 Application Processor (AP). Based on the AT&T Unix V operating system, this optional attached processor will enable System 85 users to support a variety of applications, the company reported. The initial program for the processor is the Centralized System Management application, which provides switch control and administrative functions. Also compatible with the System 75

Western Union's Easylink service available on-line

NEW YORK — Western Union Corp. recently announced enhancements to its Easylink electronic communications service that include an on-line communications capability, a session control feature and a digital paging system.

The on-line capability reportedly will provide users with direct communications with other users and with the Western Union Telex system.

Online Conversation is said to give users the capability to converse directly on screen with another Easylink user if the addressee has an autoanswer terminal registered with Easylink, regardless of the brand of terminal. Messages can be sent from personal computers, word processors and terminals to the 1.5 million Telex system machines worldwide.

Session Control is a service enhancement that reportedly provides access to all Easylink services with a single telephone call and sign-on procedure, eliminating the need to redial when users want to switch services. Session Control reportedly provides a menu of options, including Easy-

MCI's Datanet packet-switching service to make debut at Calif.-based bank

By James Connolly
CW Staff

NEW YORK — Security Pacific Corp. and MCI Communications Corp. recently announced here that Security Pacific National Bank will be the first user of MCI's Datanet packet-switching service.

The Security Pacific Automation Network (Span) will provide the Los Angeles-based bank with packet-switched financial data services in 110 markets containing 85% of the U.S. population and eventually will be expanded worldwide, according to the bank and MCI.

"Span gives Security Pacific the capability to be the low-cost provider of specialized financial services to the customers of our $42 billion diversified corporation," said DuWayne J. Peterson, chairman of Security Pacific Automation Co.

The customized network is being tested now and will be commercially operational in January.

It will link the bank and its correspondent banks, corporate and individual customers, 1,100 consumer and commercial finance offices, mortgage banking offices and wholesale and retail securities offices.

Early applications will be automobile loan financing; point-of-sale; On-Line Advantage, a personal computer network for discount brokerages; and Specifics, the bank's on-line cash management and treasury workstation.

"Span is the first of what we anticipate will be many large corporate networks providing customer financial services, as well as meeting the internal data communications needs of corporations," said MCI Digital Information Services Corp. President J. Robert Harcharik.

He said Datanet allows a large user, such as Security Pacific National Bank, to tailor the value-added facilities and services of a public packet-switching network to its own needs.

> *'Span is the first of what we anticipate will be many corporate networks providing financial services.'*
> — J. Robert Harcharik, president, MCI Digital Information Services Corp.

Electronic mail revenue seen doubling annually through 1988

NEW YORK — Revenue from electronic mail services will soar by an annual average of over 100% through 1988, according to a report by Link Resources Corp., a market research firm based here that studies electronic media.

"Overall electronic mail services revenue will grow from $80 million at [the end of] 1983 to more than $2.1 billion in 1988. This represents an exponential average annual growth rate of 107%," according to the study, titled "Electronic Mail Services."

Computer-based messaging services that offer terminal-to-terminal messaging will be more successful in the long term, but mixed mode services that offer terminal-to-terminal and facsimile transmission will be spectacularly successful over the five-year forecast period, according to the Link study.

Trends spurring growth

The mixed mode services are a $22 million market in 1984, but will jump to $800 million in annual revenue in 1988, according to Link.

Link cited a series of trends that will spur the growth of electronic mail, including the following:

■ New hardware and software to accommodate the proliferation of microcomputers via easy-to-use communications software packages.

■ Customized pricing to offer the best mix for large users and transactional pricing to give users a sense of start-and-finish use, instead of open-ended use of time-sharing.

■ Expected approval before the end of 1984 of the CCITT-recommended Series X.400 interface protocols to reduce equipment compatibility problems.

■ Marketing of customized messaging applications that are part of specific organizational processes rather than a substitute for the telephone message or memorandum.

■ The growth of communities of users with services for small businesses and consumer users and closed users group services for people of common interest, such as lawyers.

The report noted that new categories of electronic mail vendors have developed to challenge the traditional providers, which are computer time-sharing firms and value-added network operators, service bureaus that provide intersite compatibility between different vendors.

New providers

New types of providers include vendors that are becoming more communications-oriented; independent software houses; and mass market voice and record carriers, including MCI Communications Corp., Western Union Corp., Federal Express Corp. and AT&T, Link said.

Link reported that some of the growth will be at the expense of existing telex systems, whose cost, speed and character set limitations make them unsatisfactory for time-sensitive business communications.

More information on the study is available from Link, which is located at 215 Park Ave. S., New York, N.Y. 10003.

Single-vendor local-area nets seen topping OA mart

By Kathleen Burton
CW West Coast Bureau

SAN FRANCISCO — General-purpose local-area networks will dominate the office automation market by the year 1990, according to Ralph Ungermann, president and cofounder of Ungermann-Bass, Inc.

Addressing an audience of analysts, investment bankers, OEM marketing managers and financial planners here, Ungermann said companies can take three approaches when installing local-area networks — use a single-vendor turnkey system, interconnect proprietary products from different vendors or use a general-purpose local-area network from a single vendor.

The last method is becoming most prevalent because proprietary local-area networks lock users into a single vendor over long periods of time, and using systems from different vendors poses integration problems because gateways between networks do not exist yet. IBM's token-ring product, for example, is still two to three years away, he said.

Ungermann, whose firm manufactures local-area networks, said optical fiber clearly will dominate the media over the long term.

Although optical fiber is not currently as cost-effective as coaxial cable because of the high cost of equipment like connectors and splicers, costs will plummet in the next several years, he predicted.

New York-based Fiber Track is already selling time on fiber-optic circuits for 6 cent/circuit (per minute/per month), while 10 years ago it cost $1/min, he said. IBM will use optical fiber in its token-ring strategy, Ungermann predicted.

Applications software will drive the local-area network market in 1985, Ungermann said. He predicted a trend toward server and application-specific software, distributed data bases and distributed word processing programs that are able to move files from mainframes to personal computers. Such software will let personal computer users describe what is needed from the mainframe, provide data security and transpose information into the proper format.

With the emerging software, about half the system's intelligence (diagnostics, for example) will reside on the network, and the remainder (such as data bases and format converters) will reside on the host and attached devices, Ungermann added.

In order for local-area networks to become more prevalent in medium to large businesses, applications software must resolve incompatibility issues, local-area network companies must focus on meeting future demands for high-bandwidth capacity, and local-area networks must be restructured so that multivendor systems are always available on a network, Ungermann said.

A local-area network standard will not emerge in this century, Ungermann predicted, because vendors — protective of their installed bases — do not want a single standard. The advantages to standards are lower costs, low risk of product obsolescence and product compatibility.

In the Japanese and European markets, Ungermann said, separate standards are developing. The Japanese are rallying behind Ethernet because they do not want IBM to dominate their market, and Europe is leaning toward International Standards Organization standards.

General-purpose, standardized local-area networks in factory automation will be one of the fastest growing market segments through the end of the decade, growing from less than $20 million now to $1 billion by 1991, he predicted.

VOICE/DATA COMMUNICATIONS

VOICEMAIL INTERNATIONAL, INC.

Version 2 Voicemail

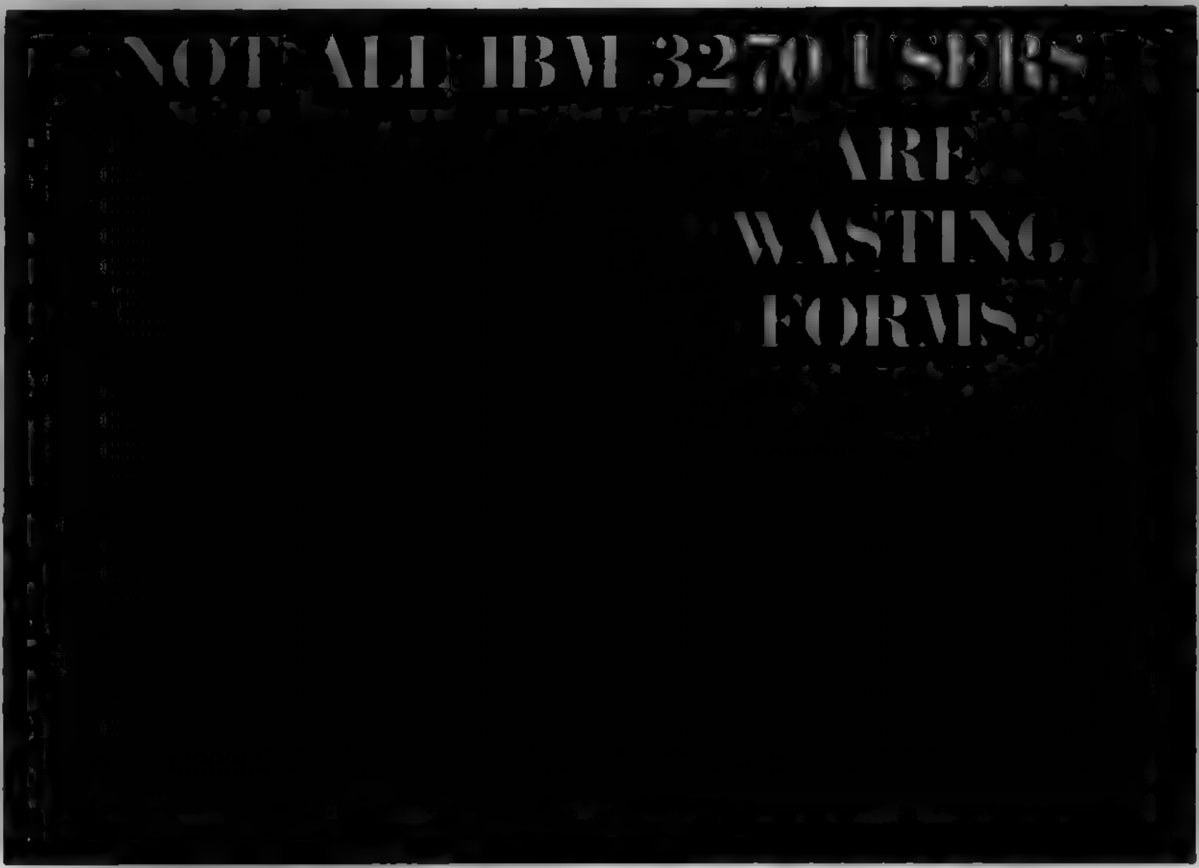
Message redirect, multilevel prompting, password security and reverse messages are among the enhancements announced in Version 2 of the Voicemail voice message storage and retrieval system from Voicemail International, Inc.

In addition to 11 enhancement features, Voicemail has added six new voice mailbox options including a two-way communications box that allows a user to correspond with a specific individual or group without requiring the other user to learn system commands. Also added were a drop box, a single box or group of boxes with a single-message life for commercial applications. According to the company, once the single message is received, the box is no longer valid.

The Voicemail system reportedly does not require private branch exchange (PBX) supervision, although it can be integrated with PBXs and Centrex. According to the company, modular design allows for expansion from an eight-port to a 64-port system with up to 207 hours of storage.

According to the vendor, Version 2 is free to current customers. A standard eight-port Voicemail package sells for $[illegible].

Voicemail International, Building 49, 3350 Scott Blvd., Santa Clara, Calif. 95051.



THE ISI 487 CONSERVES.

Not long ago, all IBM 3270 users were treated alike. Anyone that needed immediate access to a printed form was forced to waste a form for each form removed. Simple tasks turned into costly and frustrating procedures on the IBM 3287 printer.

Then the ISI 487 arrived. With tractors tucked neatly away and a tear-off scale positioned conveniently up front, the ISI 487 allows users to tear-off forms right after printing without any waste. Designed to fulfill any application, the ISI 487 handles continuous forms or single sheets and delivers dot matrix, near-letter quality, and incredibly sharp large character label printing.

The ISI 487 has satisfied a variety of IBM 3270 users. Isn't it time you joined them? This plug-compatible replacement for the IBM 3287 carries a price tag as low as $3,350 and belongs anywhere forms are dispensed immediately after printing. *Hospitals, insurance companies, manufacturers, and ticket outlets* — put an end to unnecessary waste!

For more information about the ISI 487 and our other IBM compatible (fully integrated, *no box*!) printers, like the ISI 736 letter quality printer with twin sheet feeder, call, write, or TWX us today!

PROTOCOL CONVERTERS

INNOVATIVE ELECTRONICS, INC.

MC 80/900

Innovative Electronics, Inc. has announced a protocol converter that is said to allow any personal computer or Ascii terminal to access IBM mainframe environments and Ascii hosts concurrently in either local or remote configurations.

The MC 80/900 reportedly is a microprocessor-based, stand-alone unit that lets Ascii terminals and personal computers appear as IBM 3278 display stations. It connects directly to an IBM 3274/76 cluster controller or to the display/printer adapter of the IBM 4331 by coaxial cable. It is said to support bisynchronous or Systems Network Architecture/Synchronous Data Link Control communications.

An auxiliary RS-232 port allows an attached personal computer or Ascii terminal to have simultaneous pass-through access to an asynchronous minicomputer or public data base without requiring the user to log off the active IBM host session..

The MC 80/900 costs $1,095.

Innovative Electronics, 4714 N.W. 165th St., Miami, Fla. 33014.

SOFTWARE

CLEO SOFTWARE

3780Plus

Cleo Software has announced 3780Plus for high-speed computer-to-computer file transfer for the IBM Personal Computer, Hewlett-Packard Co.'s HP 150 microcomputer and AT&T's 3B2 and 3B5 minicomputers.

The product is said to support IBM 3780 and 2780 binary synchronous protocols and to transfer at up to 19.2K bit/sec. As a 3780 emulator, 3780Plus is said to offer transparent mode, space compression, device selection, printer forms control, spooling, configurable line parameters and line trace for diagnostics.

Prices range from $500 to $1,499.

Cleo Software, 461 N. Mulford Road, Rockford, Ill. 61107.

LEGIST AUTOMATION, INC.

Step/IV

Legist Automation, Inc. has introduced a software package that allows the IBM Personal Computer to access Motorola, Inc./Four-Phase Systems, Inc. Series IV office automation system.

Specific Terminal Emulation Program/Series IV (Step/IV) is said to allow IBM Personal Computers and compatibles, with asynchronous connections at any line speed from 300 bit/sec to 9.6K bit/sec, to operate as if they were locally attached terminals on the Series IV running under Four-Phase MFE operating system.

The personal computers reportedly can use any of the programs running on the Series IV, including Four-Phase Foreword word processing and Vision data entry and processing and graphics, Cobol or Legist's Then-If spreadsheet.

The product also supports networking of Series IV processors, allowing the inbound personal computer user to go through the nearest Series IV and attach to an application running on another Series IV using either asynchronous or bisynchronous communications.

The component running on the Four-Phase host costs $3,500; the networking option, $1,500; and the first copy of the personal computer component, $160. The package will be available in January.

Legist Automation, Suite 6, 2214 Michigan Ave., Arlington, Texas 76013.

MULTIPLEXERS/ MODEMS

COMDESIGN, INC.

IM-4800, IM-9600 modems; TX-700; TS-600

Comdesign, Inc. has introduced advanced integrated modems as an option for its line of statistical multiplexers. Also announced was a microprocessor-based assembler/disassembler and a switching statistical multiplexer.

The Integral Modems (IM) series products are said to be compatible with CCITT recommendations V.27 or V.29. According to the vendor, the IM-4800 and IM-9600 operate full-duplex, point-to-point over four-wire, unconditioned private lines.

Front panel touch-key controls or optional executive port supervisory channels reportedly let configuration monitoring and diagnostic functions be performed through the intelligent networking device. Primary operating speeds are 9,600 bit/sec (V.29) and 4,800 bit/sec (V.27). Pricing is $2,595 and $1,795 respectively.

The TX-700 assembles data in packets via a packet-switching network and disassembles the packets at the receiving end. All TX-700 programming can be performed from a standard terminal connected to the system's supervisory port. Pricing starts at $2,600.

The TS-600 reportedly multiplexes up to 32 remote devices onto a single link at speeds up to 19,200 bit/sec and provides channel switching and port connection capabilities.

The price is $3,100 for an eight-channel unit.

Comdesign, 751 S. Kellogg Ave., Goleta, Calif. 93117.

MULTI-TECH SYSTEMS, INC.

MT224AD

Multi-Tech Systems, Inc. has introduced MT224AD, a modem that oper-

ates at speeds of 300, 1,200 or 2,400 bit/sec.

The product can store up to six 37-digit telephone numbers and can detect busy signals and dial tones, according to the vendor. The modem reportedly operates in either synchronous or asynchronous modes and can be connected to either dial-up or dedicated telephone lines. The product's commands allow the unit to redial a busy number until there is a connection or dial a second number, the vendor said.

MT224AD is compatible with Hayes Microcomputer Products, Inc.'s Smartmodem 1200 and is able to run communications software written for the Hayes product.

MT224AD costs $[illegible].

Multi-Tech Systems, 82 Second Ave. S.E, New Brighton, Minn. 55112.

CODE-A-PHONE CORP.
Tel-A-Modem

Code-A-Phone Corp. has announced Tel-A-Modem, an intelligent modem that is integrated into a two-line telephone.

Tel-A-Modem reportedly combines a full-featured key telephone with an intelligent command modem device that provides simultaneous voice and data communications. The modem provides audio and visual status indicators, automatic redialing of a last number, nine-number memory automatic dialer and volume controls for ring signals and line monitors, according to the vendor.

Tel-A-Modem features tone or pulse dialing and transmission speeds of 300 or 1,200 bit/sec.

Tel-A-Modem costs $695.95.

Code-A-Phone, P.O. Box 5656, Portland, Ore. 97228.

THEALL ENGINEERING CO.
Modemphone

Theall Engineering Co. has introduced a full-duplex modem and memory redial telephone in a desktop housing.

The Modemphone is said to contain an asynchronous, 300 bit/sec, full-duplex AT&T 103-compatible modem with an RS-232 port. The product reportedly uses large-scale integration design and has LED indicators for data carrier detect, receive data and transmit data signals. It was designed for either Touch-Tone or pulse dialing with a 10-number redial capacity. Prices start at $110.

Theall Engineering, P.O. Box 336, Oxford, Pa. 19363.

LOCAL-AREA NETWORKS

BRIDGE COMMUNICATIONS, INC.
CS/1 server

Bridge Communications, Inc. has announced an Ethernet local-area network terminal server that implements the Transmission Control Protocols/Internet Protocol (TCP/IP) network protocols.

The CS/1 server with TCP/IP software performs the function of a terminal or host server, allowing up to 32 asynchronous devices to access host computers that support TCP/IP and are attached to an Ethernet local-area network. The protocols have been standardized by the U.S. Department of Defense and are a standard part of the AT&T Unix 4.2 bulk storage device operating system.

When attached to Ethernet, the CS/1 reportedly is needed only on the terminal side of the terminal-to-host switch. Asynchronous devices can be connected via Ethernet to host computers that do not support TCP/IP by using CS/1 units running TCP/IP software on both the terminal and host sides of the network, the vendor said.

The CS/1 with TCP/IP is available for $9,900 with eight serial ports; additional eight-port expansion boards for up to 32 ports are $1,900 each. A one-year TCP/IP license is $250, and the software comes on a 5¼-in. diskette.

Bridge Communications, 1345 Shorebird Way, Mountain View, Calif. 94043.

NETWORK SYSTEMS CORP.
Hyperbus interfaces

Network Systems Corp. has announced three interfaces to attach low- to medium-speed asynchronous RS-232 peripherals to its Hyperbus local-area network.

The Models B113, B114 and B116 are said to support four, eight and 16 ports, respectively, at a simultaneous 9.6K bit/sec per port transmission speed.

Hyperbus is a baseband coaxial system using carrier-sense multiple access/collision avoidance contention.

According to the vendor, the B116 costs $292.50 per port and provides more capabilities than units in the $350-$650 price range.

Network Systems, 7600 Boone Ave., Minneapolis, Minn. 55428.

TEST EQUIPMENT

INFINET, INC.
NIS 90/60; EMS-II Network Control System

Infinet, Inc. has announced a series of network management, control and performance measurement products integrated into a single data base.

The NIS 90/60 decision support system is based on a Digital Equipment Corp. VAX-11/730 processor running AT&T Unix. According to the vendor, the system has user-definable screen formats, open architecture and a report generator.

The 90/60 reportedly has 456M bytes of fixed Winchester disk storage, a streaming tape drive and support for 16 terminal devices.

Toward Clearer Communications:
InteCom discus

The NIS 90/60 works with the PMS-II, a performance measurement system that monitors network performance and protocol-regulated parameters. Cost of the system is $150,000.

Infinet also announced an upgrade from its EMS-I product, the EMS-II Network Control System that reportedly allows users to monitor, test and control both digital and analog lines and devices from one console. According to the company, the unit provides advanced analog parameter measurements, such as phase jitter, signal-to-noise ratio and received-signal level. Line quality is measured by generating a 1,003-Hz tone, the company said.

Modem speeds and multiplexer channels can be reconfigured from a central-site EMS console. The console is menu-driven and has color-coded function keys.

The system, which can be integrated into the data base or used separately, sells for $16,500. Price includes the microcomputer system, operating console and printer.

Infinet, 6 Shattuck Road, Andover, Mass. 01810.

AUXILIARY EQUIPMENT

RACAL-MILGO, INC.
Datacryptor II Model 1027

Racal-Milgo, Inc. has announced an encryption device said to protect sensitive unclassified government data and to meet Federal Standard 1027.

Datacryptor II Model 1027 implements the U.S. National Bureau of Standards' Data Encryption Standard algorithm, according to the vendor.

The encryptor/decryptor reportedly operates with protocol transparency at data rates up to 9,600 bit/sec, synchronously or asynchronously, in full or half duplex modes and on leased or dial-up lines.

It operates in conjunction with an accessory key writer, which enters cryptographic key values. The unit features self-test and operator-test diagnostics.

Available now, it costs $2,800.

Racal-Milgo, 8600 N.W. 41st St., Miami, Fla. 33166.

BLACK BEAR ELECTRONICS, INC.
DLV11-J Distribution Panel

Black Bear Electronics, Inc. has announced a distribution panel that is said to facilitate the changing of speeds supported by Digital Equipment Corp. DLV11-J asynchronous boards as used in DEC PDP-11 minicomputers.

The DLV11-J Distribution Panel has a 40-pin flat ribbon cable connecting it to the PDP-11 Q-bus and four eight-position dip switches that allow the user to select speeds from 300 to 9,600 bit/sec.

Modular connectors across the top reportedly allow the user to attach a Black Bear modular distribution system using RJ-11 cables. It also is said to feature surge protection on transmit and receive lines, five RJ-11 female jacks for distribution and 30 insulation displacement terminals designed to solve the problem of interconnecting discrete wires.

It costs $99.95 without a speed regenerator and $225 with one.

Black Bear Electronics, 3201 Santa Monica Blvd., Santa Monica, Calif. 90404.

AMERICAN PHOTONICS, INC.
AFM3270

American Photonics, Inc. has announced a fiber-optic interface designed to convert data from RG62U cable for fiber-optic cable.

The AFM3270 was designed to screw into IBM 3270 series multiplexers, including the 3M Corp. 6600 multiplexer and the Astrocom Corp. 3274 Squeeziplexer. It is said to be a transparent link that converts data between two IBM terminal multiplexers from RG62U cable to fiber optic.

It reportedly can be rack-mounted or supplied in a tabletop model.

A unit designed to handle up to 32 terminals costs $1,250. They are available six weeks after receipt of order.

American Photonics, 71 Commerce Drive, Brookfield Center, Conn. 06805.

ITT DIALCOM, INC.
Xmail

ITT Dialcom, Inc. has announced an electronic service said to provide a direct connection between its electronic mail system and the worldwide telex and telegram network.

Xmail enables Dialcom users to send and receive messages on personal computers, word processors or terminals. Xmail links those users to about 200,000 public telex terminals in the U.S. and more than 1.8 million terminals overseas. Messages can also be sent simultaneously to other Dialcom electronic mailboxes.

One of Xmail's benefits is said to be that it eliminates the need for a special telex terminal. A telex message can be sent using a personal computer and a telephone. Another feature is Xmail's ability to transmit the same message to as many as 500 addresses simultaneously.

Xmail's price includes Dialcom's normal hourly rate of $16.50 to $20.00 during prime business hours and $16.50 at off-peak times, plus the telex transmission rates.

ITT Dialcom, 1109 Spring St., Silver Spring, Md. 20910.

TELEPROCESSING PRODUCTS, INC.
TP-511

Teleprocessing Products, Inc. has introduced a network-compatible

Continued on page 104

ses voice/data integration.

The manufacturer of the first integrated voice/data switching system considers the issues.

Data is a major factor in office communications today. It's projected that within the next five years, data transmission will increase from the present 2% to 40% of total PBX traffic. That's explosive growth. And it means that companies must accommodate this increase by expanding their present systems or by planning now to replace obsolete systems with ones that can meet those needs.

A look at alternatives.

To keep pace with this change, an organization has two basic choices. First, it can stay with a limited voice-only PBX and create separate data networks. This, however, is a costly, inefficient method, and it becomes increasingly difficult to manage multiple expanding systems.

The second alternative is an integrated voice/data system. By installing one network, a company can have voice and data capabilities at every outlet.

Key benefits are the sharing of resources—devices and software—and consolidated network management. An integrated system is an investment in the future that can pay for itself in the savings of single network administration.

A definition of terms.

Integrated voice/data is sometimes thought of as simply combining voice and data in one switch. But it's really much more. It's the total integration of voice and data through a twisted pair network.

Because a digital system does not distinguish between voice and data, both look the same as they pass through the switch. So it's possible to apply sophisticated voice features to data—least cost routing, conference calls between workstations, callbacks on data terminals and other aids to productivity that are normally associated with voice-only systems.

Major considerations.

Universal Connectivity

One of the greatest challenges facing communications professionals today is the management of changing technology. In an environment where many approaches to office communications call for complete flexibility, only a system designed to be compatible with multi-vendor equipment is a safe choice. Such a system provides the format and protocol conversion capabilities for dissimilar devices to communicate with each other, freeing a company from the need to choose all its equipment from one vendor.

A system should be capable of connecting numerous dissimilar devices to a common network, allowing them to share peripherals, data and functions. This flexibile connectivity also protects your investment in equipment, ensuring its continuing value.

Non-Blocking Traffic

In voice systems, many calls can share one path through the switch because conversations are short and not everyone uses his telephone at the same time. However in data communications each device needs full access through the switch, and the long holding times of data calls place heavy demands on a network. As more data circuits are added to meet growing user needs, a system founded on voice-only design can't handle the traffic and begins to block calls from completion, or to degrade the quality of transmission.

Non-blocking matrix architecture, however, places no restrictions on voice and data access. As the data-to-voice proportions change, the system is reconfigured at the host controller. And there's no new cabling required. In non-blocking systems, savings are soon realized in simplified administration.

Processing Capacity and Speed

Many installed systems operate on 16-bit processors. While this may be adequate power for today's voice-only systems with few data options, it may not be sufficient for tomorrow.

Since a system's processors are the limiting factor, they must offer enough capacity for growth. A system offering 32-bit processors can handle both present and future capacity requirements. It's valuable insurance against obsolescence, with unlimited potential for applications like video and future developments.

The office automation industry is introducing more and more devices that operate at speeds up to 10 Mbps. Only an integrated voice/data system that offers 10 Mbps connectivity and integrated local area networking can successfully carry a company into the automated office environment now evolving.

A view for the future.

In 1979 InteCom introduced the first integrated voice/data system, the IBX™ Integrated Business Exchange, and since then has been setting the pace for the office communications industry.

The system has been proving its merits in installations all across the country for more than three years. It's backed by comprehensive support and refined through an ongoing program of research and development. Software-oriented, adaptive to new technology and protected from obsolescence, the IBX offers you the connectivity needed for tomorrow's automated office.

We hope this look at the issues of voice/data integration will be useful to you in your system selection. InteCom has met the communications requirements of companies in a wide range of industries. And today, our representatives are ready to help you evaluate your specialized needs.

asynchronous digital termination unit for use with digital data service (DDS) networks.

The TP-511 is based on the vendor's synchronous TP-501 channel/digital service unit and is said to require fewer components and reduce the number of devices required to implement asynchronous DDS.

The device is said to feature circuit status indicators and front-panel switches for line control, business equipment loopbacks and pattern generation for user-controlled, end-to-end testing.

It is available in a stand-alone desktop version or a high-density, rack-mount version. The price is $1,175.

Teleprocessing Products, Building 7K, 4565 E. Industrial St., Simi Valley, Calif. 93063.

HADAX ELECTRONICS, INC.

Data switching system

A manual data switching system that lets users switch data lines between active and fall-back equipment was introduced recently by Hadax Electronics, Inc.

The system reportedly enables test and monitoring equipment to be placed on-line for data diagnostics. It also reportedly provides a means of centralizing data line routing.

The standard 19-in. rack-mount unit accommodates up to 16 card modules. Card interfaces include RS-232/V.24, RJ-11C and RJ-45C, Coax BNC, IBM Twinaxial, Wang Laboratories, Inc. BNC/TNC and V.35/CCITT. The standard rack-mount unit sells for $170.

Hadax Electronics, 79 Hazel St., Glen Cove, N.Y. 11542.

ALPHA MICROSYSTEMS, INC.

AM-316 I/O controller

Alpha Microsystems, Inc. has announced a 17-port, I/O controller designed for use in its multiuser business microcomputers.

The AM-316 controller is said to provide 16 RS-232 ports and one Centronics Data Computer Corp.-compatible parallel port on Alpha Microsystems S-100 bus. According to the vendor, the controller uses only one slot rather than the three slots required to provide the same number of ports on the company's previous model, the AM-300.

It is said to feature a watchdog timer and a reboot on break key function. Available now, it has a suggested retail price of $1,325.

Alpha Microsystems, 17332 Von Karman Ave., Irvine, Calif. 92714.

AT&T

from page 99

and the Dimension 2000, the 3B5 AP can reportedly be used to manage up to 15,000 station moves and changes. To be made available early in 1986, the 3B5 AP will be priced from $170,000.

The voice system the company introduced, called the Audio Information Exchange, or Audix, is the first phase of the newly created unified messaging scheme. As part of the company's Information Systems architecture, unified messaging is meant to, eventually, provide for the integration of different message systems, such as voice and electronically displayed text.

Audix is compatible with the System 85, Dimension 2000 and Dimension 600 PBXs. Designed to be integrated into these switches, Audix essentially provides individual users with capabilities similar to an answering machine. Audix can be configured with 32 ports, which is reportedly adequate to service up to 4,000 users.

Audix systems range in price from $140,000 to $430,000, depending on the number of ports and hours of storage provided. It will become available in 1985.

link Instant Mail Service, Online Conversation, Western Union's FYI News service, an on-line directory of Easylink subscribers, Help messages and information on new services.

Western Union also announced Mailbox Alert, a digital paging service said to provide Easylink users with instant notification when messages are received in their electronic mailboxes. Users will receive a flash-and-beep digital pager that will be signaled by local paging carriers when a message is received.

Mailbox Alert, priced from $15 to $20 per month, will become available in 30 areas throughout 1985.

Prices for Easylink are dependent on the time of day and the length and speed of transmission. A Western Union spokesman said a 1,200 bit/sec peak-hour transmission costs 45 cent/min, with a 40% discount for off-peak hours. There is no minimum usage for the first three months, but there is a $25 minimum monthly usage fee after three months.

Western Union also announced that Businessland, Inc. has agreed to offer Western Union's Instant Mail Manager Software, designed for use with Easylink, in Businessland stores. Instant Mail Manager has a suggested retail price of $95.

Western Union is located at One Lake St., Upper Saddle River, N.J. 07458.

PowerHouse® Means Business on VAX

The biggest name in 4th-generation languages on minicomputers is now on VAX

With POWERHOUSE as your development language, it's easy to stay ahead of the demand for commercial applications.

And POWERHOUSE is the ideal language for developing data-entry and reporting support for scientific and engineering applications.

PowerHouse supports RMS

Because POWERHOUSE supports your RMS files, it's the perfect language for moving to 4GL productivity on VAX without an expensive file-system conversion. You can start using POWERHOUSE with your existing RMS-based applications today.

And with RMS as the standard, you can keep using all the software packages you've been using with your RMS files in the past.

More than 2,200 installations

POWERHOUSE's proven technology has revolutionized application development in more than 28 countries around the world.

With more than 2,200 installations, POWERHOUSE is used on more commercial minicomputers than any other 4th-generation language. POWERHOUSE is also the only 4GL to achieve over $25 million in sales in the minicomputer market.

No. 1 in Datapro survey

In the entire 1983 Datapro survey of commercial software products on every computer, POWERHOUSE ranked No. 1 for customer satisfaction.

Open your VAX for business today

Install POWERHOUSE today and open *your* VAX for business. Write us for a POWERHOUSE demonstration and your copy of the book "HOW TO DEVELOP BUSINESS APPLICATIONS WITH POWERHOUSE."

With Exxon you never have to face it alone.

Hmmm...Exxon support people make sure I get what I need, when I need it.

We think the way your office automation equipment works out is just as important as the way it *works*. So at Exxon Office Systems we support you — in every step of your office automation program.

First, before we'll sell you any equipment, we perform a free needs analysis. Once you've made a commitment, we don't just deliver boxes to your door. We install your equipment for you, and then we train your staff to use it.

If you or they have any questions we have toll-free on-line support/service that works with you on similar equipment. And that support includes the immediate dispatch of service, if it's ever needed.

You see, at Exxon we're committed to office automation support that's so complete, it will face up to all your needs.

For additional information call 800-367-8888, or write Exxon Office Systems, P.O. Box 10184, Stamford, CT 06904-2184.

IBM CPUs lauded but ploy suspected

Strong performance enhancement and a political ploy is how industry analysts summed up IBM's two most recent mainframe announcements, the 4381 Model Group 3 and the 3083 Model CX [CW, Oct. 29].

The long-predicted dual processor version of the 4381 processor was generally received by industry watchers as a well-priced addition to the 4300 line. The 4381 Model Group 3 processor, which IBM said offers internal performance between 1.7 and 1.9 times greater than the 4381 Model Group 2 processor, appears to have the ability to serve a dual role for IBM, noted Frank Gens, an analyst for the Boston-based Yankee Group market research firm. Gens said larger commercial users of the 400 processor line can take advantage of the increased performance of the Model Group 3.

But at the same time, Gens noted, IBM appears to have positioned the Model Group 3 to offer engineering-oriented performance to rival Digital Equipment Corp.'s newly announced VAX 8600 and Data General Corp.'s MV/1000 superminicomputers. Gens added that IBM's 4381 Model Group 3 plus DEC's recent VAX 8600 announcement may put more pressure on Data General and Prime Computer, Inc. to unveil more powerful top-end processors.

IBM's 3083 Model CX was given less favorable reviews by industry analysts, largely because it appears unclear whether many users will ever buy the unit. Charles Greco, an analyst with the Framingham, Mass.-based market research firm International Data Corp. (IDC), said IBM claims the entry-level 3083 Model CX was designed for users who expect to experience a 75% annual growth in processing power. IBM said the advantage of the Model CX is that users who install the system have the option of gaining a tenfold field-upgradable power improvement if they were to migrate up the 3080 line to IBM's top-of-the-line with a 3084 Model QX processor.

But Greco pointed out that

Sun Microsystems unveils two graphics workstations

Unix-based Sunstations support Ethernet

MOUNTAIN VIEW, Calif. — Sun Microsystems, Inc. has announced the Sun-2/50 Desktop Sunstation and the Sun-2/160 Color Sunstation, both for graphics applications and both based on the Motorola, Inc. 68010 microprocessor. The company also announced the Sun Network File System.

The two workstations run Version 4.2 of AT&T's Unix operating system and support the Ethernet local-area network. The Sun workstations also support the C, Fortran and Pascal programming languages and offer the company's Suncore graphics and Sunwindows window manager software, according to the vendor.

The Sun-2/50 features from 1M to 4M bytes of main memory and up to 16M bytes of virtual address space per process. A floating-point accelerator for computer-intensive applications is optional. The 2/50 features a 19-in. screen with 1,152- by 900-pixel resolution and noninterlaced display.

The 2/50 is said to operate without a local disk drive by demand paging over the network to mass storage on the file server. Several diskless machines can share the

Datamedia introduces supermicros, terminals for Unix, Pick environments

By John Desmond
CW Staff

NASHUA, N.H. — Datamedia Corp. has announced five 932 supermicrocomputer models and the Elite 60 and Elite 90 display terminals.

The 932 Models 1610, 1620 and 1624 run on the Unisoft System Corp. Uniplus+ operating system, a derivative of AT&T's Unix System V.

The 932 Models 20P and 30P use the Pick operating system from Pick & Associates, Inc.

The Elite 90 display terminal was designed for use in a Unix environment with the 932, and the Elite 60 is a Digital Equipment Corp. VT100-compatible display terminal designed for use with the Pick operating system.

SYSTEMS & PERIPHERALS

TURNKEY SYSTEMS

COLLIER-JACKSON, INC.
CJ/Personnel for HP 3000

Collier-Jackson, Inc. has introduced a Hewlett-Packard Co.-based turnkey system for personnel departments in medium and large companies.

CJ/Personnel uses the HP 3000 superminicomputer. Its capabilities include storage and retrieval of personnel information, current and historical job-related data, skills inventory, resume information and attendance graphics.

The system also uses applicant listings, employee status notice, attendance reports, benefit statements, federal Occupational Safety and Health Administration standards and employee transfer information, the company said.

The system also reportedly provides the ability to share information with other systems, the vendor said. For example, if an applicant becomes a full-time employee, the information can be transferred directly into the payroll system.

Cost of the system is $38,500, including CPU, 55M-byte disk with cartridge tape, a printer and three CRTs. Larger configurations are available.

Collier-Jackson, 3707 W. Cherry St., Tampa, Fla. 33607.

K/W CONTROL SYSTEMS, INC.
Monitoring and Management System

K/W Control Systems, Inc. has announced the Monitoring and Management System for centralized users of multiple hardware systems.

The system is intended for use with large DP and communications facilities maintaining multiple electrical, electronic, pneumatic or engine-driven systems, including uninterruptible power supplies, motor generators, frequency converters, telecommunications equipment and lighting systems.

The system consists of the IBM Personal Computer XT with 10M-byte fixed disk, color monitor, floppy disk drive, graphics printer and System Interface Unit (SIU). The SIU provides all communications links to attach the, Personal Computer XT and up to 128 Remote Device Controllers (RDC). RDCs are available in three types: analog input, up to 32 inputs; digital input, up to 16 inputs; and event recorder, up to 15 inputs.

System software is loaded into the Personal Computer XT's hard disk via a 320K-byte diskette and is resident in the Personal Computer XT's 10M-byte fixed disk. All system displays are provided on the Personal Computer XT's 13-in. color monitor, which provides up to 16 colors.

The price for the Monitoring and Management System with one analog input RDC is $17,000.

K/W Control Systems, Department MMS, South Plank Road, Middletown, N.Y. 10940.

FLEXSTAR CORP.
FS8500 Analog/Digital Test System

Flexstar Corp. has announced the FS8500 Analog/Digital Test System, said to perform subassembly-level tests on any head/disk assembly used in any 5¼-in. or 3½-in. Winchester disk drive running Seagate Technology Inc.'s ST-506/412-type interfaces.

The tester is controlled by an IBM Personal Computer or compatible microcomputer, the vendor said.

The system includes a single-board disk drive tester that reportedly performs digital read/write testing via the ST-506/412 interface; a Personal Computer interface card that plugs into the I/O card slot to interface the Personal Computer with the drive tester card; and the analog probe. The test software runs under IBM's PC-DOS 2.11.

The system can be incorporated into a Personal Computer with 256K bytes of main memory, dual floppy disk drives for test data storage, a monitor and printer. The tester performs functional status, read/write and timing tests for hard disk drives, the firm said.

The single-unit price of the FS8500 is $24,000, the vendor said.

Flexstar, 780 Trimble Road, San Jose, Calif. 95131.

DATA STORAGE

COMPUPRO CORP.
Floppy/hard disk subsystem

Compupro Corp. has announced a 5¼-in. floppy/hard disk subsystem for use as a mass storage option for its System 816 family of IEE 696/S-100 bus-compatible microcomputers.

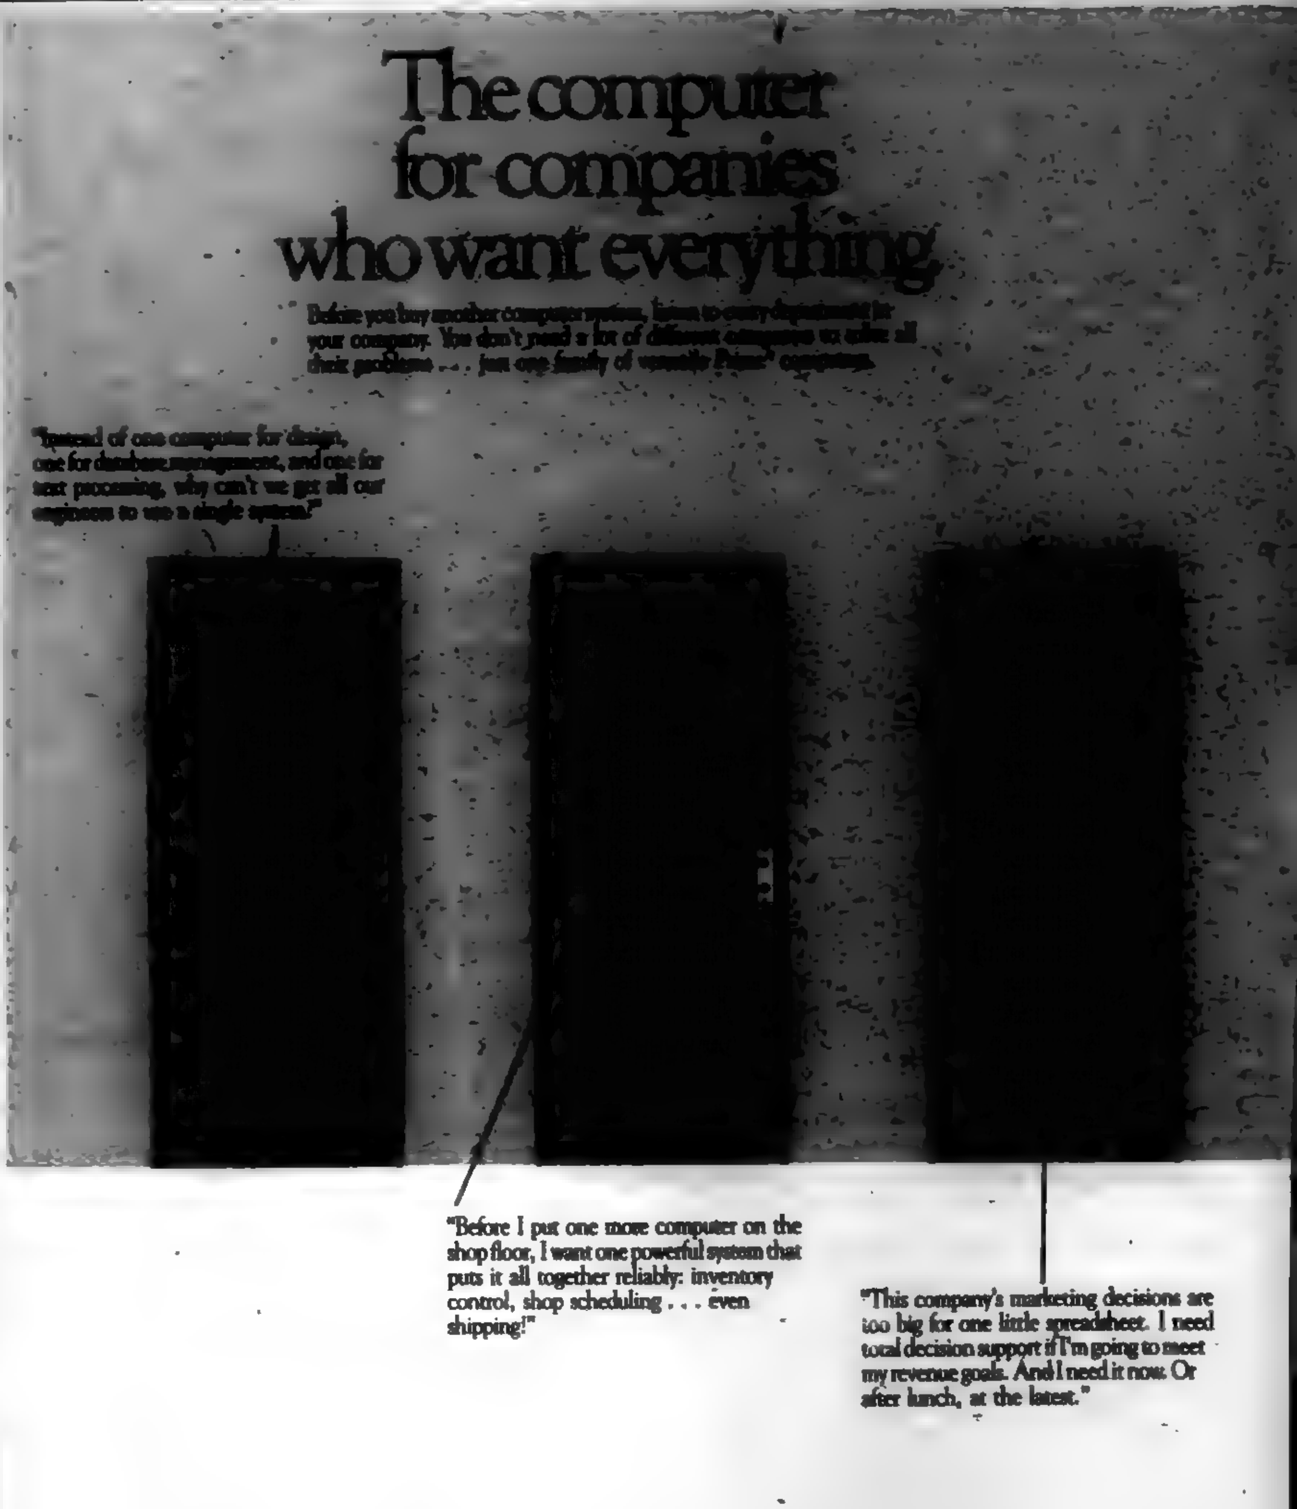
The disk subsystem features two 5¼-in. Mitsubishi Electronics America, Inc. double-sided, double-density 96 track/in. half-height floppy disks with a total of 1.6M bytes of formatted storage and a hard disk with either 20M, 40M or 80M bytes of storage. It also includes Compupro's Disk 3 direct-memory access disk controller and Digital Research, Inc.'s Concurrent DOS 8-16 operating system.

Double-sided 5¼-in. disk formats supported include Epson America, Inc.'s QX10, the IBM Personal Computer, NEC Information Systems, Inc.'s PC-801A and Zenith Data Systems Corp.'s Z-100.

Single-sided 5¼-in. disk formats supports include IBM, NEC's PC-8801A single-density, Xerox Corp. 820-II and Osborne Computer Corp. double-density, Texas Instruments, Inc.'s Portable Professional and Zenith's Z-90.

The 5¼-in. disk subsystem with a 20M-byte hard disk is priced at $4,995; with a 40M-byte hard disk, $5,495; and with an 80M-byte hard disk, $9,495.

Compupro, 3506 Breakwater Court, Hayward, Calif. 94545.



The computer for companies who want everything
Before you buy another computer system, listen to every department in your company. You don't need a lot of different computers to solve all their problems . . . just one family of versatile Prime® computers.
"Instead of one computer for design, one for database management, and one for text processing, why can't we get all our engineers to use a single system?"
"Before I put one more computer on the shop floor, I want one powerful system that puts it all together reliably: inventory control, shop scheduling . . . even shipping!"
"This company's marketing decisions are too big for one little spreadsheet. I need total decision support if I'm going to meet my revenue goals. And I need it now. Or after lunch, at the latest."

COMPUTER AUTOMATION, INC.
Winchester drive for Datacase/5

Computer Automation, Inc. has announced that a 140M-byte 5¼-in. Winchester disk drive is now available for its Datacase/5 multiuser minicomputer system. The unit brings the total capacity of the system to [illegible] bytes.

The drive is compatible with Seagate Technology, Inc. 506/412 fixed disk drives and features a transfer rate of 5M-bit/sec and ferrite recording heads, according to Computer Automation.

A typical configuration for a 140M-byte system supporting eight users is approximately $12,000, the company said.

Computer Automation, Computer Products Division, 2181 DuPont Drive, Irvine, Calif. 92713.

TERMINALS

TEKTRONIX, INC.
CX4100 series

Tektronix, Inc. has announced its CX4100 series of computer display terminals, which were designed for IBM 3270 plug-compatibility.

The terminals reportedly include the feature set of the Tektronix 4105, 4107 and 4109 terminals, while providing direct coaxial connection to an IBM 3274 cluster controller, 32-line 3278/3279 alphanumeric emulation, an IBM-style keyboard and an expanded range of drivers for Tektronix peripheral devices.

The series was intended to let IBM host users utilize Tektronix Plot 10 graphics commands while retaining IBM 3270 alphanumerics and keyboard. The CX series reportedly carries out a greater portion of the graphics tasks at the terminal than the programmed symbol-cell graphics in an IBM environment. According to Tektronix, Plot 10 graphics commands locally perform vector-to-raster conversions and rapid area fills, relieving the host CPU burden.

The terminals — the CX4106, CX4107 and CX4109 — are said to retain their RS-232C connection and are able to switch between IBM and RS-232 hosts without ending either session.

They reportedly feature a 60Hz noninterlaced display with 4,096- by 4,096-pixel addressability in a 640- by 480-pixel matrix, the ability to draw solid or dashed lines in up to 16 colors using eight line styles, 11 marker types, zoom and pan, user-defined fonts and macros and local picture storage. The series also supports Digital Equipment Corp. VT100 extensions and Ansi X.3.64 editing and word processing standards, according to the vendor.

The CX4106 costs $7,950; the CX4107, $8,950; and the CX4109, [illegible].

Tektronix, P.O. Box 1700, Beaverton, Ore. 97075.

SOLARIS COMPUTER CORP.
Solaris 1000

Solaris Computer Corp. has announced a hardware and software package that adds IBM Personal Computer capabilities to asynchronous terminals such as the Digital Equipment Corp. VT100, CIE Systems, Inc. CT-101 and Televideo Systems, Inc. Televideo 970.

The Solaris 1000 is said to provide concurrent operation of host and personal computer applications, a multiwindowing feature for viewing host and Personal Computer functions simultaneously and bidirectional file transfer using Microsoft Corp. MS-DOS commands or off-the-shelf file transfer software.

The Solaris 1000 plugs into the communications line between the host computer or modem and the terminal. It features a 45-key pad that provides the keys needed to make up an IBM Personal Computer keyboard and Solaris special function keys.

It consists of the keypad and a system unit housing an I/O card with an Intel Corp. 8088-2 microprocessor, two dual-sided, double-density floppy disk drives for 720K bytes of storage, an optional 10M-byte hard disk and internal memory of 128K bytes, expandable to 640K bytes. It also offers four RS-232C I/O ports, a printer port and seven expansion slots.

It can run in full-screen host mode, full-screen Personal Computer mode or split-screen mode, the vendor said. Screen image size reportedly is controlled by grow keys on the Solaris keypad, allowing the user to increase or decrease the size of each window.

Information reportedly can be exchanged between the system and the host computer, with results such as spreadsheet calculations developed on the Solaris-equipped terminal being sent to the host and host data being used by Solaris 1000 programs.

The software includes the real-time and multitasking Solaris Operation System and MS-DOS 2.11.

The Solaris 1000, with 128K bytes of random-access memory and a single floppy disk drive, costs $2,125.

Solaris Computer, 1994 Tarob Court, Milpitas, Calif. 95035.

PRINTERS/PLOTTERS

EXTENDED SYSTEMS
Laser Right printer controller

Extended Systems has announced the Laser Right laser printer cluster controller for use with the Hewlett-Packard Co. 2686A Laser Jet printer.

Laser Right is said to allow up to three workstations to share one Laser Jet printer. The controller is said to work with either parallel Centronics Data Computer Corp.-type interfaces or serial RS-232 or RS-422 interfaces. The product also works with Lotus Development Corp.'s 1-2-3 and software for IBM Personal Computers, the vendor said.

Laser Right comes with 128K bytes of buffer memory and can be expanded to 512K bytes. The HP Laser Jet printer prints 300 by 300 dot/in. resolution at up to eight page/min., the company said.

The price for Laser Right is $4,495, the vendor said.

Extended Systems, P.O. Box 4937, 6062 Morris Hill Road, Boise, Idaho 83711.

CALCOMP
Model 1044 plotter

Calcomp has announced the Model 1044 dual-mode pen plotter, featuring eight pens and a plotting capability up to Ansi Size E or International Standards Organization Size AO standards.

The Model 1044 is aimed at mechanical design, architectural, engineering and construction, integrated circuit design, printed circuit board design and mapping applications.

Features include an eight-pen turret said to exchange pens automatically over the plotting surface; an Integrated Communications Interface that allows plotter compatibility with Microsoft Corp.'s MS-DOS and Digital Research, Inc.'s CP/M-based systems. Built-in diagnostics are said to run five tests each time the plotter is turned on.

The Model 1044 is said to provide a plotting speed of 14 in./sec, the company said. The plotter offers three interfaces — RS-232, RS-449 and IEEE-488. It is scheduled to be shipped in December. The price for the 1044 is $11,995, the vendor said.

Calcomp, 2411 W. LaPalma Ave., Anaheim, Calif. 92801.

MOHAWK DATA SCIENCES CORP.
MDC 160, 200 series printers

Mohawk Data Sciences Corp. has announced two MDS 160 printers and one MDS 200 series printer for use with the MDS Hero Intelligent Workstation and the company's Super 21 communications processor.

The 160 series printers are dot matrix printers and the 200 series models are correspondence-quality printers. The 160 series, featuring 80- and 156-col. models, is intended to print drafts, near-letter-quality text, graphics and reports. The 156-col. model is said to be suited for spreadsheet applications such as Microsoft Corp.'s Multiplan and MDS' Plan 21. Both 160 series printers print bidirectionally at 160 char./sec for drafts and 27 char./sec for business correspondence.

The price of the 80-col. printer is $995, and the 156-col. printer costs $1,295, the vendor said.

The 200 series operates at 200 char./sec for draft quality and 50 char./sec for letter quality. The price of the 200 series printer is $3,495.

Mohawk Data Sciences, Seven Century Drive, Parsippany, N.J. 07054.

POWER SUPPLIES

CLARY CORP.
UPSjr.

Clary Corp. has announced a series of on-line uninterruptible power supplies called UPSjr., intended for supermicrocomputers, minicomputers and local-area networks.

The Clary UPSjr. is available in 750-VA, 1.25-kVA and 2.5-kVA ratings. The cabinet measures 33.5-in. high by 17.4-in. wide by 20-in. deep.

Prices for the UPSjr. start at $3,495, the vendor said.

Clary, 320 W. Clary Ave., San Gabriel, Calif. 91776.

BOARD-LEVEL DEVICES

INTERCONTINENTAL MICRO SYSTEMS
WS80X

Intercontinental Micro Systems has announced a board that converts a dumb terminal into an intelligent independent workstation.

The WS80X board has 128K bytes of random access memory, a Zilog, Inc. Z80 microprocessor operating at 4 MHz or 6 MHz, two serial ports, one parallel port and an Datapoint Corp. Arcnet interface.

According to the company, the parallel port allows the WS80X to act as an independent processor. Shugart Associates Standard Interface and Small Computer Systems Interface permit peripheral additions such as floppy drives, hard disks, removable cartridge drives or streaming tape drive backup.

Intercontinental's Micronet network architecture and subsystems allow the WS80X to interface with 8- and 16-bit processors.

Cost of the 4-MHz board is $995; the 6-MHz board is $1,045.

Intercontinental Micro Systems, 4015 Leaverton Court, Anaheim, Calif. 92807.

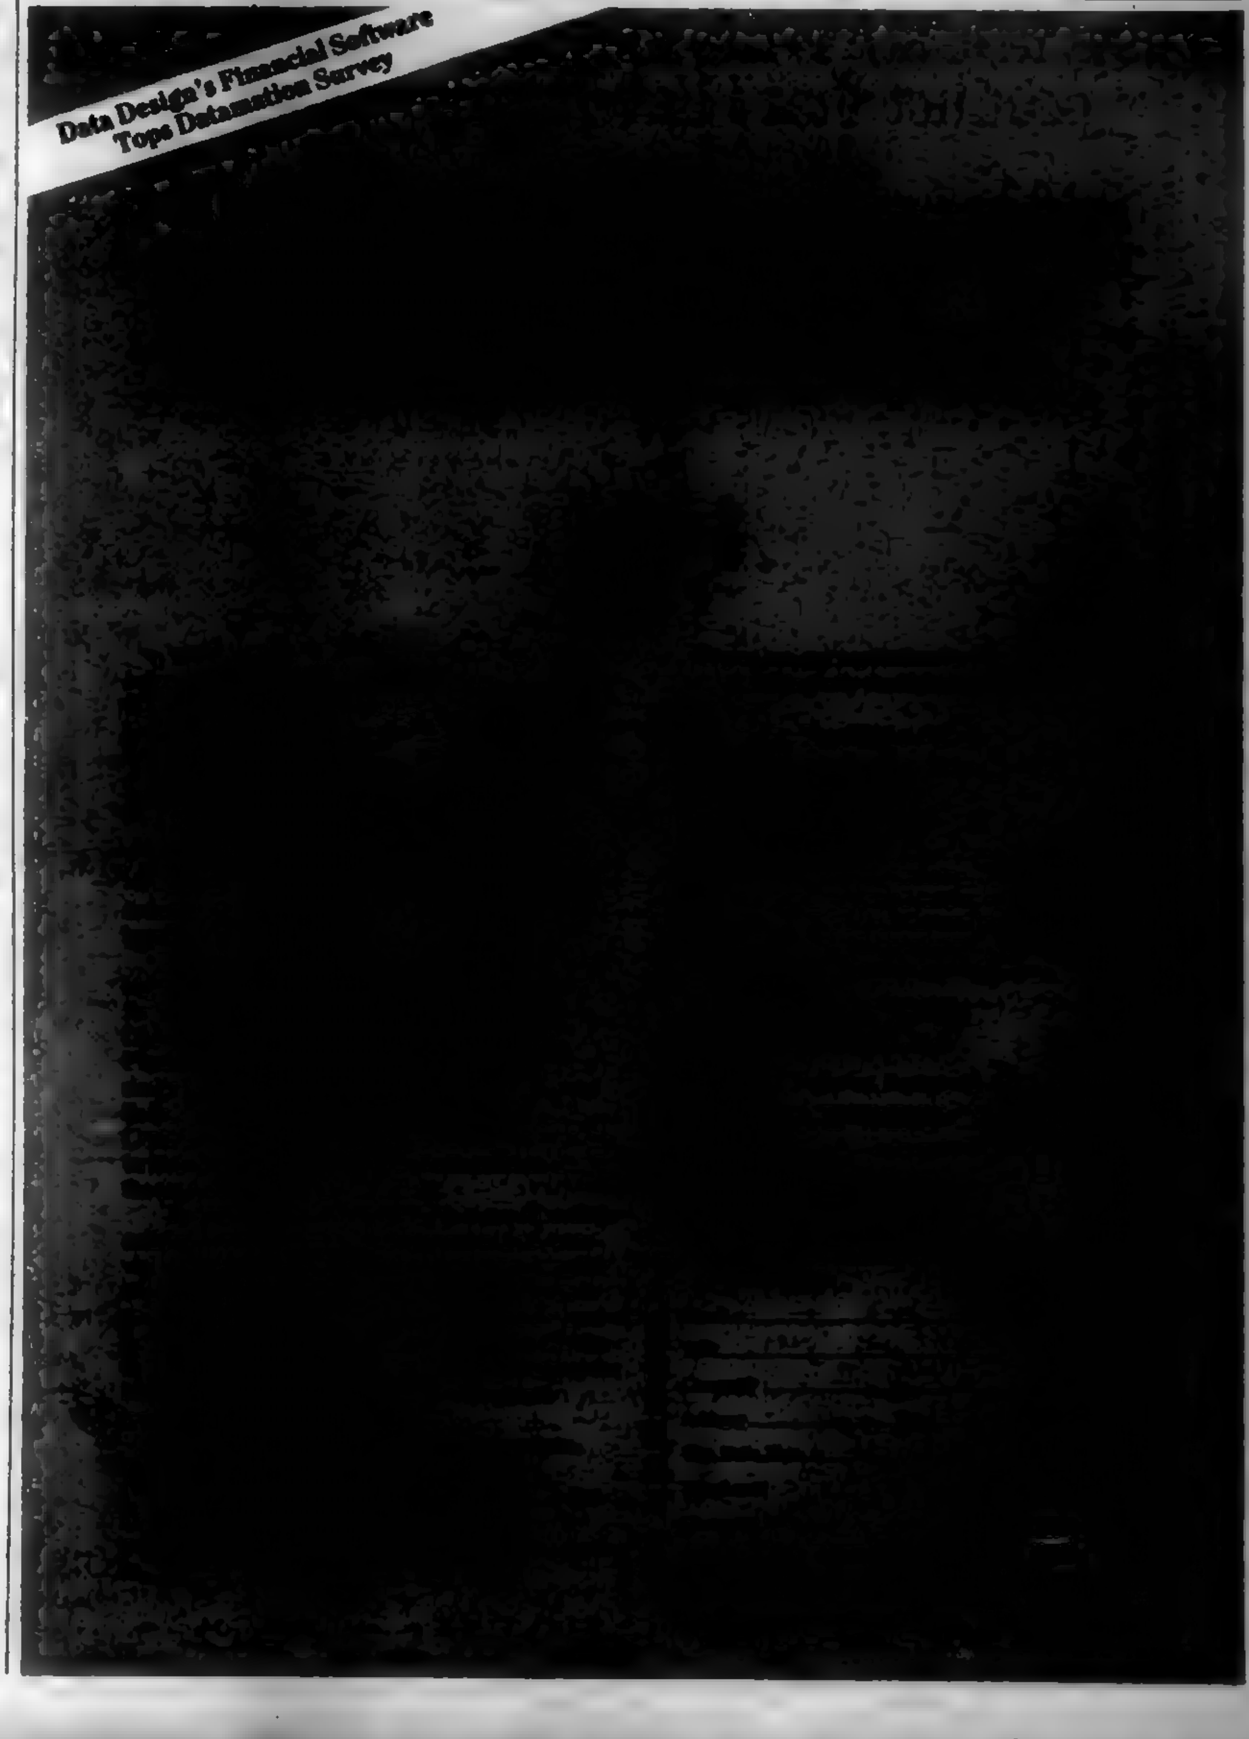
ABLE COMPUTER CO.
Microverter; Microverter Plus

Able Computer Co. has announced two bus converters designed to increase the performance of Digital Equipment Corp. PDP-11 minicomputers.

The Microverter is said to be a quad-width card that plugs into a PDP-11's Q-bus backplane and addresses up to 4M bytes of Q-bus memory while driving 19 DEC Unibus loads.

The Microverter Plus consists of a modified Unibus backplane, voltage regulator and Microverter board. When coupled with a DEC PDP-11/73 or PDP-11/73+, it can transform an older processor into a higher speed Unibus system, according to the vendor.

Continued on page 112



Continued from page 111

The products are said to be compatible with current versions of DEC RSTS/E and RSX-11.

Scheduled for October shipments, the Microverter costs $2,300, and the Microverter Plus costs $3,575, the vendor said.

Able Computer, 1732 Reynolds Ave., Irvine, Calif. 92714.

HOUSTON COMPUTER SERVICES, INC.
MCPU/300

Houston Computer Services, Inc. has introduced the MCPU/300 interface board, said to allow Texas Instruments, Inc.'s Business System 300 to expand its support from seven CRTs and/or printers to 15.

The MCPU/300, an updated version of the firm's MCPU/8 front-end processor, is said to allow up to 12 RS-232 devices to connect directly to the interface card.

The product, which incorporates both hardware and software, acts as a front-end processor for the System 300's CPU.

The MCPU/300 is available in either a 12- or six-channel version and consists of the company's 16-bit microprocessors, 32K bytes or 64K bytes of memory and RS-232C interfaces. Using the software supplied with the board, the System 300 can be connected to most Ascii CRT terminals and personal computers, the company said.

The price for an MCPU/300 is $2,750, according to a vendor spokesman.

Houston Computer Services, Building C, Suite 101, 11221 Richmond Ave., Houston, Texas 77082.

MACROLINK
Macro-3 disk controller

Macrolink has announced the Macro-3 disk controller, said to be compatible with Perkin-Elmer Corp.'s 3200 series of superminicomputers.

The single-board module is said to offer simultaneous emulation of PE's Intelligent Disk Controller and older Mass Storage Module disk system. PE users previously had to buy two different disk controllers to read both formats, the vendor said.

All drive configurations are supported in microcode by a single set of erasable programmable read-only memory devices, according to the company.

The price for the Macro-3 is $3,475.

Macrolink, 1150 E. Stanford Court, Anaheim, Calif. 92805.

MOSTEK CORP.
MK75702 board

Mostek Corp. has announced a 1M-byte dynamic random-access memory VMEbus-compatible board, the MK75702, that features a long-word cache with typical read access time of 135 nsec on a cache hit and 300 nsec on a cache miss rate.

The product is available with or without parity generation and checking and is capable of 8-, 16- or 32-bit data transfers, the company said. Additional features include 23-bit address, programmable starting address and access and status LED indicators.

The price of the MK75702 board is $3,500, the company said.

Mostek, 1215 W. Crosby Road, Carrollton, Texas 75006.

See BOARDS page 114

EasyPROCLIB is the most stable, error-free product that I have in my system.*

That's one of the reasons EasyPROCLIB pleases all of the people all of the time. EasyPROCLIB gives you solutions, not more problems.

And consider what these solutions will do for you and the people who use your system.

"We just give them a copy of the EasyPROCLIB manual and they're on their own. All they need is a minimum knowledge of job control language."*

If you're in charge of your data center's procedure library, EasyPROCLIB works for you by taking the responsibility for maintaining, controlling and repairing the system PROCLIBs off your shoulders, freeing up time to get other work done.

Users like EasyPROCLIB because it gives them control of their own PROCLIBs, and they can create and modify them any time without involving the systems staff.

And data center management likes EasyPROCLIB because it increases overall productivity, and if a user crashes his private library, it doesn't affect the system or other users. An EasyPROCLIB diagnostic message notifies the user, and he is responsible for repairing or restoring it.

"What would I do if they told me I had to give up EasyPROCLIB? I'd fight them!"*

There's no limit to the number of procedure libraries that may be established with EasyPROCLIB. There can be a private procedure library for each department, each development group, each programmer—for as many different divisions as you need. This means that you don't have to worry about deciding whether a procedure should be included in the installation's procedure library—and users don't have to try to accomplish specific applications using less efficient general purpose procedures.

Because EasyPROCLIB is completely transparent, many users don't know that they have it. But the data center management and staff know—because it simplifies their job, cutting down housekeeping time and giving them more time to manage. Since it was introduced six years ago, EasyPROCLIB has been installed at hundreds of IBM sites, and wherever it's been installed, it's still in use.

"We'll give you thirty days to see what EasyPROCLIB can do for you. Free!"**

You can try EasyPROCLIB in your own facility for thirty days on us. Installation takes about an hour of system programmer time and fifteen minutes of machine time.

For more information or to set up your free thirty-day trial, call today: 1-[illegible]

EasyPROCLIB (for IBM, MVS/XA, MVS, SVS, VS1, MVT)

FINANCE

from page 107

storage capacity of 1.5M bytes and a minimum capacity of 512K bytes. Performance improvement over the Model 2 is provided by expanded main memory and hardware error correction. The Model 2 can be upgraded to the Model 3 in the field, IBM said.

Shipment of field conversion kits is scheduled for March, and shipment of new units is scheduled for August 1985. The price for the Model 3 with 512K bytes main memory is $15,370, IBM said. The charge to convert from the Model 2 with 192K bytes of memory to the Model 3 with 512K bytes of memory is $5,075, IBM said.

The enhanced 4700 Finance Communication System Controller Data Support provides disk/diskette enhancements that include the ability to update the header label of a keyed data set and to do so by any station when the data set is closed. The local configuration facility has been enhanced to support the Model 3 controller and the Systems Network Architecture feature on the 4701 Models 2 and 3, IBM said.

Enhancements for system start-up include loading of optional modules that are optimized for more efficient storage and selective elimination of loading of one or more optional modules at initialization, IBM said. They are included in the Model 3 price.

More information may be obtained from IBM, 900 King St., Rye Brook, N.Y. 10573.

ALPHA

from page 107

1000X, which features 128K bytes of main memory, ranges from $12,165 to $15,985, the company said. Backup configurations offered include the company's videocassette recorder (VCR) backup, a combination VCR and floppy disk backup or a VCR combined with a 40M-byte streaming cartridge tape.

Alpha Microsystems also announced a 55M-byte Winchester disk storage subsystem for use with the AM-1000X desktop. The price of the subsystem is $5,985.

Prices for the AM-1000E systems are now $9,665 for systems with the VCR backup, $10,835 for the VCR and floppy disk backup and $12,835 for the VCR and 40M-byte streaming tape backup, the company said.

Alpha Microsystems is located at 17332 Von Karman Ave., Irvine, Calif. 92714.

Introducing the Kodak WHIZ KIDS

New Kodak IMT-250 microimage terminal

New Kodak Reliant 2000 microfilmer

The smartest and fastest microfilmer and retrieval terminal Kodak has ever made.

Inside the new Kodak Reliant intelligent microfilmer 2000 and the IMT-250 microimage terminal lie the brains of powerful microprocessors.

Taking instructions from software programmed to match your operation, they automate most of the functions once performed manually by an operator.

They monitor themselves continuously. Communicate with each other. The Whiz Kids even stop if something goes wrong, and tell the operator—in plain English—what went wrong and how to correct it.

They allow more detailed coding than ever before offered by Kodak, retrieve faster and more accurately than ever before.

Since this new image recording device and new retrieval terminal are compatible with future systems, they won't become obsolete.

The Kodak Whiz Kids. Return the coupon and let them help your information handling run faster and smarter than ever before.

ANDROMEDIA SYSTEMS, INC.

MM11 board for DEC Q-bus

Andromedia Systems, Inc. has introduced a memory board for the Digital Equipment Corp. Q-bus.

Compatible with DEC's LSI-11/23, 11/73 and Microvax I processors, the MM11 is a dual-width module that has a typical access time of 30 nsec in the block transfer mode, the company said. The MM11 is compatible with both 256K- and 64K-byte random-access memory chips.

The MM11 includes user-programmable jumpers for 22- or 18-bit addressing, 16- or 256-word block-mode capability and standard or optional control status register address, the company said.

The price of the MM11 with 512K-byte capacity is $1,295, the vendor said.

Andromeda Systems, 9000 Eton Ave., Canoga Park, Calif. 91304.

CLEARPOINT, INC.

Q-COM-BO card

Clearpoint, Inc. has announced the Q-COM-BO card that combines 1M byte of memory, two serial lines and 128K bytes of erasable programmable read-only memory on a dual-height card.

The Q-COM-BO is said to offer the same functionality of Digital Equipment Corp.'s MXV11-B with eight times the memory, block-mode direct memory access, on-board control status register for full parity support and a 90-nsec access time.

The card has two 28-pin universal sockets, giving it the capacity to achieve up to 64K bytes of progammable read-only memory and allowing users to configure DEC PDP-11/23 or PDP-11/73 minicomputers with three dual slots.

The single-quantity price ranges from $1,295 to $3,195, depending on configuration, the vendor said.

Clearpoint, 106 South St., Hopkinton, Mass. 01748.

AUXILIARY EQUIPMENT

PITNEY BOWES, INC.

8100 facsimile machine

Pitney Bowes, Inc. has announced the 8100 facsimile machine, said to be capable of transmitting copy at a speed of 20 sec/page with a 9.6K bit/sec modem.

Standard features of the machine, which weighs 22 lb, include automatic contrast control, a 40-line activity journal and turnaround polling, the vendor said. The product's document feeder is said to be capable of stacking up to 30 pages.

An RS-232C attachment, allowing the machine to receive telex messages or act as a remote printer from personal computers, is optional.

The price of the 8100 is approximatley $4,000, the vendor said.

Pitney Bowes, 163 Crosby St., Stamford, Conn. 06926.

WILSON LABORATORIES, INC.

Floppy Drive Test Station

Wilson Laboratories, Inc. has announced the Floppy Drive Test Station, or FTS-500, said to accommodate four 5¼- or 3-in. floppy drives for testing and calibration.

FTS-500, when combined with the company's MFX-500 Floppy Drive Analyze, is said to provide all mechanical and electronic test functions and calibration measurements with a minimal requirement for an oscilloscope.

Tests include read margins, full step, write data and read data. Calibration operations include head radi-

MICROS

from page 107

Features of the 932 supermicro include a maximum of six 512K-byte random-access memory (RAM) boards, a 20M-byte cartridge tape and maximum unformatted disk storage of 572M bytes. The system supports up to four disk drives, serial and parallel printer ports and an IEEE 488 interface bus.

Models 1620 and 1624 are based on the Motorola, Inc. 68010 microprocessor and feature hardware-assisted demand paging, a 2K-byte cache and 1M byte of RAM.

The price for Model 1620 with Unix, a 52M-byte hard disk and support for six users is $16,675, the company said. The price for Model 1624 with Unix, a 143M-byte hard disk and support for 16 users is $22,435, the company said.

The price for Model 1610, which is based on the Motorola 68000 microprocessor and can support up to six users in a configuration with Unix and a 52M-byte disk, is $12,930, the company said. The 1600 series also supports the Pick operating system and up to 26 users, the vendor said.

The Models 20P and 30P, which both incorporate the Pick operating system, are based on the Motorola 68000 microprocessor and feature a 20M-byte cartridge tape, 52M bytes of unformatted disk storage, storage capacity to 572M bytes, serial and parallel printer ports and an IEEE 488 interface bus. Each model supports up to 26 users, the vendor said.

The price for Model 20P, with a 512K-byte main memory and support for up to six users, is $12,005, the vendor said. The price for Model 30P, with 1M byte of main memory and support for up to 16 users, is $14,380, the vendor said.

The price for the Elite 60 purchased separately is $1,095, and for the Elite 90, $1,045, the company said.

More information may be obtained from Datamedia, 491 Amherst St., Nashua, N.H. 03063.

"We can't afford to lose data! That's why we bought insurance... Data Check Recovery."

Marv Harop
Systems Programmer
CADAM Inc.,
Burbank CA

"Before we got Data Check Recovery, we more or less threw up our hands in desperation when we had an I/O error–all that pack analyzing, reinitialization, restoring. It all takes time; it's cumbersome.

"Since we installed Data Check Recovery, I've cut down the amount of time I spend on those problems.

"Historically, we've had quite a few problems with data checks on the 3380 packs we use on our MVS system. And as a software R&D firm, being able to get at the latest version of our software is critical to us; having to devote programmer time to correcting DASD errors is wasteful.

"So we bought Data Check Recovery as an insurance policy. And it's paid off.

"For instance, one morning the SYSLOG data set indicated data checks had occurred during the nightly backup of the packs. All I had to do was take the information from the error message and plug those parameters into the DCR procedures–and what could have been a permanent disaster became a very minor inconvenience.

"Data Check Recovery is so easy to run that operations will soon run it themselves, without having to check with the systems group.

"DCR is our first line of defense against disk I/O errors. And it just keeps paying for itself!"

Data Check Recovery is a powerful, dependable utility that recovers data that has become unreadable due to permanent I/O errors–hard data checks, track overruns and several types of equipment checks. Data Check Recovery supports all OS operating systems.

For more information about how DCR can keep permanent I/O errors from turning into permanent disasters, call Software Corporation of America toll-free at 800/368-7638. In Virginia, call 703/471-1545.

THE ITT 9236.
IT HAS THE FUNCTIONS YOU WANT TODAY, THE FLEXIBILITY YOU'LL NEED TOMORROW.

When it comes to extended functions, our new 9236 display has everything.

For instance, it gives you dual logical units that let you change applications with a single keystroke.

It has selectable screen formats so you can use one display to handle more than one application.

It can use a light pen or operate a display-attached printer so you can make local copies at your workstation.

It offers the ergonomic benefits of a non-glare matte finish. A compact, low-profile keyboard. And a flicker-free, high-resolution, 14-inch screen that tilts and swivels.

On top of all this, our 9236 gives you extended data stream and programmed symbols for color graphics. Plus a long list of exclusive ITT productivity features, like automated keystrokes, built-in notepad, dynamic color assignment, and auto log off/power off.

But perhaps the most important thing we've built into our 9236 is a flexible, open architecture. The kind of architecture that'll take you into networking, the electronic office, or wherever else you want to grow.

Of course it wasn't easy designing in all this and keeping the 9236's price competitive, too.

But, then again, giving you more display for your money has always been what ITT Courier is all about.

For more information, contact your nearest ITT Courier Representative. Or call the ITT Courier Sales Support Dept. at 1-800-528-1400, toll-free.

al alignment, head amplitude test, drive speed adjustment, index-to-data alignment, write protect switch and track-zero sensor adjustment.

The price for the FTS-500 is $1,495, the company said.

Wilson Laboratories, 2237 N. Batavia St., Orange, Calif. 92665.

COMPUTER SECURITY SYSTEMS, INC.
Arbiter

Computer Security Systems, Inc. has announced the Arbiter random data encryption and terminal authentication system, said to employ patented hardware circuitry to encrypt and decrypt data transmissions.

Arbiter is a self-contained peripheral that reportedly works simultaneously in real time with data entry. It is said to require no software programs, key locks, password, magnetic cards or other accessories.

One Arbiter is connected to the host computer or CPU, and another to a remote terminal. The telephone connection of any unauthorized transmission is automatically broken. Anyone attempting to eavesdrop on a transmission receives random encryption in a scrambled pattern.

The single-unit price for one Arbiter is $4,000; at least a pair is required for operation, the firm said.

Computer Security Systems, Suite 1C07, One Huntington Quad, Melville, N.Y. 11747.

ANALOGIC CORP.
Ands 5600

Analogic Corp. has announced the Ands 5600 distributed data acquisition system (DAS), an enhancement of the Ands 5400 DAS for use with Digital Equipment Corp.'s Q-bus and Hewlett-Packard Co.'s direct memory access interfaces.

The 5600 is said to cut the burden on the host computer. Two fiber-optic cables provide a 2-MHz serial link at up to 2,000 feet between sites.

Typical applications for the 5600 include fossil and nuclear power plant monitoring, pipe vibration analysis and aircraft R&D.

The price for a basic Ands 5600 is $6,890, the company said.

Analogic, 8 Centennial Drive, Centennial Industrial Park, Peabody, Mass. 01961.

SUN from page 107

disks of a Sun-2/120 or Sun-2/170 file server, the company said.

The price of a Sun-2/50 with 1M byte of memory is $9,900, the vendor said.

The Sun-2/160 has a 19-in. screen with 1,152- by 900-pixel resolution and noninterlaced display. Eight color planes are said to be capable of simultaneously showing 256 colors selected from a palette of 16 million. The 2/160 is also capable of accessing up to 16M bytes of virtual memory per process, the vendor said.

The 2/160 can operate either as a stand-alone workstation or in a local-area network with other Sun workstations and other vendors' equipment, according to the company. A 12-slot card cage and VME bus reportedly allow the 2/160 to be customized. Sun also provides an Intel Corp. Multibus-to-VME adapter board.

The 2/160 can be configured with mass storage options from 71M bytes to 380M bytes of formatted capacity, the company said. Both ¼-in. streaming cartridge and and ½-in. tapes are available for backup, and a hardware floating-point accelerator option is available for computer-intensive tasks.

The price for a Sun-2/160 with 1M byte of main memory is $32,900.

The Network File System reportedly supports transparent networkwide read and write access to directories and files. Sun is publishing the file system and supporting protocol specifications, which the vendor said are hardware- and operating system-independent.

Sun Microsystems is located at 2550 Garcia Ave., Mountain View, Calif. 94043.

IBM 3270 users: you can
the mini/micro universe

Click. Flip the switch on the Matchmaker 2000 and your 3270 terminal thinks it's a VT-100. Now you can communicate with a micro or mini computer. Access data networks such as Dow Jones and The Source, as well as local area networks, such as Net One. Send and receive electronic mail. Now the whole universe of ASCII is open to you.

Click. Flip the switch back to 3270 mode and the Matchmaker 2000 "disappears." You have a transparent path from your terminal to your IBM cluster controller. And there's no interference with the flow of data. No loss of speed. No reduction in capability.

$695. The Matchmaker 2000 is the enhancement for 3270 type terminals that allows them to emulate VT-100, ADM-3A and other types of ASCII terminals and to access a wide range of mini and micro computers. DEC. Hewlett-Packard. Data General. Prime. Texas Instruments. And others. Access them directly. Or through a modem. Via data switch or PBX at speeds from 110 bps to 19.2 Kbps.

Plug-in installation between terminal and cluster controller is quick and easy. Operation is simple. A single switch takes you from 3270 mode to ASCII mode and back again. And the cost? Only $695.

IBM is a trademark of the International Business Machines Corporation. DEC, VT-100 are trademarks of the Digital Equipment Corporation. ADM-3A is a trademark of Lear Siegler, Inc.
HP is a trademark of Hewlett-Packard Co. The Source is a service mark of Source Telecomputing Corp. Net One is a trademark of Ungermann Bass, Inc.

IBM

from page 107

while IBM has announced that the Model CX will be field upgradable, those field upgrade kits will not be available until 1986 — a prospect that may be distasteful to users expecting rapid growth. For that reason, Greco speculated, some users may choose the larger 3083 Model EX processor. Upgrade packages for that processor are currently available.

The Model CX announcement gives users a hint that the 3080 line may remain a viable product when the so-called Sierra line of mainframes is announced.

The 3083 CX "was an IBM-selfish announcement," noted Ken Harvey, president of Computer Systems Planning by Ken Harvey, Inc. in Toronto. Harvey noted that the Model CX may reflect an ongoing struggle between internal IBM development groups.

Since IBM funds many internal development projects, there is often a political power play to move development projects out to users as products.

While not a strategic product for IBM, the Yankee Group's Gens said, the 3083 CX also made a political statement to users. Gens noted that there has been a concern building among 3080 series users that they may be left out in the cold by IBM's rumored announcement of a new line of high-end processors.

The Model CX announcement, Gens said, gives users a hint that the 3080 line may remain a viable product when the so-called Sierra line of mainframes is announced. Since the Model CX appears to be simply a scaled-down version of other 3080 machines, Gens noted, offering the product does not really increase IBM's costs.

While the sweeping Oct. 25 product announcement did not contain any major hardware enhancements to IBM's System/36 small business system, the unit may have undergone a significant transformation as a result of several software announcements. By giving the System/36 the capability to act as a controller for IBM microcomputers, IBM appears to have made a major switch in emphasis in its distributed processing strategy, noted IDC's Hank Jenson. Since 1979, IBM has offered the 8100 as its showcase distributed data processing (DDP) system. Now IBM appears to have bestowed the System/36 with the top DDP title, Jenson said.

"The 8100 has at least four broken legs and should be shot," Harvey said, noting that the unit has never been one of IBM's more successful products.

But IDC's Jenson said that while he believes IBM has switched its DDP focus to the more popular, less expensive System/36, IBM will not abandon 8100 users. Jenson noted that the 8100 still appears to be IBM's best offering in a Systems Network Architecture loop environment.

William Ackerman, president of DPX, Inc., a Cupertino, Calif., software development and consulting firm for 8100 users, said the System/36 will share a dual role in the IBM DDP picture with the 8100. Ackerman stressed IBM also made several software and hardware enhancements to the 8100 as part of the Oct. 25 announcement, which indicates the company is not about to abandon the 8100 system.

How to stop your company's computer from talking to strangers.

Every day, computers have conversations with all the wrong people. Like hackers, competitors and ex-employees. They're out to break into computers to snoop, to steal or to modify data.

To stop these conversations, we present Codercard.™

A totally different security system.

Codercard alone adds a virtually impenetrable level of protection to your existing computer security.

Then Codercard goes one step further. It actually lets you monitor your other levels of protection. If someone attempts to breach your system, Codercard becomes an informant. You can know automatically exactly when the attempt was made. Whether it was made from inside or outside your company. And if inside — from which station.

How Codercard identifies strangers.

Codercard features tamper-proof "access cards," issued to authorized users. Each card contains a microprocessor which generates a unique ID number to permit access.

The card executes a proprietary algorithm to verify the unique ID. It can also be programmed to request random information such as birth date or mother's maiden name.

Wrong answers deny access — while informing your security department of a possible breach.

Beef up your dial-up security.

Codercard provides authorized dial-up access for remote users. So it actually helps your current dial-up security disconnect strangers.

Call us for more information. Ask for a demonstration. Because if you haven't seen Codercard in action, you haven't seriously considered every way to protect your data processing environment.

Codercard. It's the right way to keep the wrong people out.

CODERCARD.™

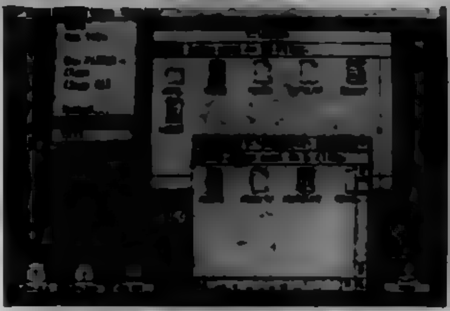
MICROCOMPUTERS

GEM user interface bows

Tool eases interaction for nontechnical users

By Eric Bender
CW Staff

MONTEREY, Calif. — Digital Research, Inc. has announced the Graphics Environment Manager (GEM) software family, designed to bring a common graphics-oriented user interface to personal computers based on the Intel Corp. 8086 family of microprocessors running Microsoft Corp.'s MS-DOS operating system.



Graphics Environment Manager application

GEM, an operating system extension, will offer an easy-to-use interface for MS-DOS applications similar to the access provided by Apple Computer, Inc.'s Macintosh, Digital Research officials said. "Because people find it easier to interact with a computer in a visual manner, GEM will effectively open up the personal computer market" to those who do not want to learn complicated commands, claimed company President John Rowley.

Acting as an application programming interface, GEM is said to supply overlapping windows, data interchange facilities, graphics device support, pull-down menus, icons and support for pointing devices such as a mouse. The software will be offered to OEMs in the first quarter of 1985.

GEM software reportedly can run on any MS-DOS-based or Digital Research Concurrent DOS-based machine "once the small amount of software code that controls the graphics screen display and pointing device has been written." Because of this, independent software vendors can write one version of their programs that can be quickly ported to other machines, the vendor said. In some cases, GEM software written for one system, such as the IBM Personal Computer, will run without modification on other microcomputers, Digital Research said.

As one Digital Research executive said, GEM initially is being released as a single-tasking package because with four graphics applications running at once, Intel 8088-based computers "just don't give you enough horsepower." Software hooks have been built into GEM to allow multi-

Two Wordstar packages out from Micropro

By Kathleen Sullivan
CW West Coast Bureau

SAN RAFAEL, Calif. — Micropro International Corp., which launched word processing on personal computers five years ago with Wordstar, unveiled two successors to its flagship product on Oct. 31.

Wordstar 2000 and Wordstar 2000 Plus reportedly feature mnemonic commands (for example, pressing "C" to copy), simplified menus, an UNDO command, context-sensitive on-screen Help and user-definable function keys. In addition, the Wordstar 2000 family is said to include:

■ Format sheets. Users can choose from a variety of preformatted page styles or create their own styles, eliminating the need to reset tab and margin settings continually or retype frequently used headings.

■ Keystroke glossary. Users can store text or a series of commonly used commands and retrieve the information or execute the command with a single keystroke.

■ Windows. Users can move text among

October offensive advances Big Blue's office strategy

By Eric Bender
CW Staff

On the Personal Computer side of IBM's recent barrage of product introductions [CW, Oct. 29], most industry observers gave strongly favorable reviews to the new Office System Family links to larger IBM machines, but downplayed the importance of enhancements to the 3270 Personal Computer and Personal Computer/370 families.

At the time of the announcement, Joseph Guglielmi, vice-president for general and office systems marketing for IBM's National Accounts Division, claimed the new offerings would "integrate the Personal Computer family fully into IBM's office system strategy."

Industry analysts generally commented that the introductions would move IBM a significant distance toward that goal. In particular, most also agreed with Guglielmi that the Office System software gives the System/36 new potential to act as a departmental computer, connecting various Personal Computer family members or other workstations.

The new software "significantly enhances the ability of the System/36 to act as a [Personal Computer] cluster," Guglielmi said. "You can have eight virtual [Personal Computer] disks on the System/36, each with up to 32M bytes. You can get printing and file server capabilities; you can download and upload files."

IBM now gives customers multiple solutions for tying together Personal Computers, with the new PC Network positioned at "a stage preliminary to a full departmental processor," commented George Weiss of Quantum Science Corp. in New

Utilizing micros can pay off for managers

MICRO BITS
Thomas Madron

One of the most pressing questions of the microcomputer era is, "Are managers and other professionals too stubborn to adapt to new technology?"

The answer given by software manufacturers, infatuated with mouses, pointing and other techniques to reduce the use of the keyboard, is an emphatic "yes."

But a more pointed question is whether organizations can afford old and unproductive modes of work when better ones are available.

The answer to this question may decide the fate of an entire generation of professional managers. Will they learn new techniques or be superseded by those who will adapt?

When managers and other professionals confront the microcomputer effectively, their work habits change drastically and productivity improves.

But how can one measure this improvement?

Productivity itself is a term better described than defined. In a broad sense, if a microcomputer allows us to do more work in a certain time or cuts the time needed to complete a task or provides information not previously available, then productivity has been improved. Productivity can be measured when new tools allow a job to be accomplished by fewer people or enable a set number of people to accomplish more jobs.

It is incumbent that managers and other professionals improve productivity. The frequently heard cry "My time is worth more than my secretary's time" ignores the fact that the old methods simply have longer throughput — it is

See ADAPT page 133

Madron is manager of computer services at North Texas State University, Denton, Texas.

Add-ons announced for Compaq Deskpros

HOUSTON — Compaq Computer Corp. has introduced 30M- and 10M-byte fixed disk storage units and an Intel Corp. 8087-2 coprocessor as options for its Deskpro family of IBM Personal Computer-compatible systems.

The 30M-byte fixed drive, offered as an option in place of the Deskpro Model 3's standard 10M-byte internal fixed drive, is said to be useful for handling large data bases, local-area networking and departmental accounting. The 10M-byte fixed disk drive is being offered as an external unit that would reportedly double the standard 10M-byte storage capacity of the Deskpro Model 3.

The 8087-2 coprocessor reportedly operates at 8 MHz and offers faster processing of calculation-intensive applications, such as those in engineering, science, financial analysis and forecasting. The standard 8087 processor operates at a speed of 4.7 MHz.

The 30M-byte fixed disk drive is priced at $2,995. The 10M-byte fixed disk drive costs $1,695. The 8087-2 coprocessor option is priced at $375.

Compaq Computer is located at 12330 Perry Road, Houston, Texas 77070.

Trigger bolsters management decision making

COCONUT GROVE, Fla. — Thoughtware, Inc. has introduced software that reportedly helps managers to focus on the most profitable areas of their operations.

Thoughtware's Trigger software is said to incorporate an expert system for management decision making, allowing managers to monitor key performance areas, to identify exceptions to performance guidelines and to issue memos regarding the problem and its solution. Thoughtware "becomes an expert system as you accumulate a knowledge base" within the software, explained Thoughtware spokeswoman Angie Niehoff.

Trigger reportedly can be used to set guidelines for measuring operations in terms of dollars, percentages, time, behaviors, actions and volume. It can also aid in determining sales quotas, staffing levels, retail sales by type, customer service effectiveness and project management control.

Trigger is priced at $495 and operates on the IBM Personal Computer and compatible systems with a minimum of 128K bytes of memory, dual disk drives and a printer.

Thoughtware is located at 2699 S. Bayshore Drive, Coconut Grove, Fla. 33133.

Microsoft adds Basic 2.0 for Macintosh

BELLEVUE, Wash. — Microsoft Corp. has announced Version 2.0 of its Basic programming language for Apple Computer, Inc.'s Macintosh microcomputer.

Version 2.0 can access various features of the Macintosh, including the mouse, pull-down menus, multiple windows and dialog boxes, buttons, sound effects and music, graphics and Quickdraw routines for font, text and cursor support, Microsoft said.

Programs can be customized to incorporate Macintosh-style features, the vendor said. Basic programs can include user-defined pull-down menus and specify the size, type and location of windows. Interactive devices like buttons and edit fields can be used to construct dialog and alert boxes, according to the vendor. The mouse function reads the horizontal and vertical position of the mouse pointer and the status of the mouse button.

Programs reportedly can be edited directly in the window with the standard Macintosh CUT, PASTE and COPY commands. A second program-listing window can be displayed, which makes it possible to view or edit separate parts of a program simultaneously, Microsoft said.

Search menu

A search menu reportedly provides options to find and replace program text. The user can search for specific text, a label or the current position of the editing cursor. Selected text reportedly can be replaced for a single occurrence or throughout the entire program.

The suggested retail price for Microsoft's Basic 2.0 is $150. Upgrades for current owners are available .

More information is available from Microsoft, Box 97200, 10700 Northup Way, Bellevue, Wash. 98009.

Softbridge Microsystems' financial planner debuts

CAMBRIDGE, Mass.— Softbridge Microsystems Corp. has unveiled Softbridge Financial Planner, an integrated package for personal financial planners that analyzes financial information, creates customized client plans and manages the planner's practice.

The system is divided into two areas, financial planning and practice management. A user interface featuring windows based on menus and forms reportedly is built into the system. A Rules-of-Thumb feature advises the planner on the client's financial condition by testing the planner's established criteria and by testing more than 50 rules that planners typically apply, all of which the planner can customize, according to the vendor. The Softbridge Customizer reportedly gives the planner tools to custom-tailor the system.

The Softbridge Integrator is said to allow planners to move from one productivity tool or task to another with keystrokes.

The Softbridge Financial Planner runs on the IBM Personal Computer XT and Personal Computer AT with IBM's PC/DOS operating system, a hard disk and 512K bytes of random-access memory.

Softbridge offers its system in several configurations: software only for $4,500; software and a streaming tape drive for $5,500; software, hard disk and streaming tape unit for $7,000; or full system with a personal computer for $11,000. A semiannual rate of $600 covers all product enhancements, new tax laws and other content updates, a newsletter and technical assistance. The system will be available in January 1985.

Softbridge Microsystems is located at 186 Alewife Brook Pkwy., Cambridge, Mass. 02138.

The Asian Computerworld reaches the fastest growing computer market in the world.

Introducing
The Asian Computerworld

The Asian Computerworld is *Computerworld's* sister publication covering the South East Asian marketplace. The English fortnightly tabloid keeps company executives, computer users, potential users and people in the computer industry up-to-date.

South East Asia is considered the fastest growing computer market in the world with a total value of $1.8 billion and annual growth rates for small business systems and micros over 50%. The average annual growth rate is approximately 30%.

The Asian Computerworld, with a total circulation of 10,000, is published in Singapore and printed every alternate Monday. Distribution of the newspaper covers Brunei, Hong Kong, Singapore, the Philippines, Malaysia, Indonesia and Thailand.

CW International Marketing Services makes it easy for you to advertise in countries all around the computer world. For more information on *The Asian Computerworld*, just fill out and return the coupon below.

Altos software links IBM micro to Xenix-based net

SAN JOSE, Calif. — In a flurry of announcements late last month, Altos Computer Systems, Inc. introduced a communications product tying IBM Personal Computers to the company's Microsoft Corp. Xenix-based network, an integrated office automation software package, a four-user system and graphics software for the Altos 186 workstation.

The new PC Path "is the industry's first communications product that ties Personal Computers and compatibles running [IBM's] PC-DOS to a Xenix-based network," said Phil White, senior vice-president of marketing. PC Path is said to allow Personal Computers and compatible machines to share disks and printers on Altos's 800K-bit/sec Worknet interface board.

IBM micros also can store files locally on Altos server units and spool printouts to shared network printers, Altos said. Users can access multiuser Xenix applications (including 3780 bisynchronous, Systems Network Architecture and X.25 communication gateways) directly from the Personal Computer, according to White. PC Path consists of a Worknet interface board and software and is priced at $395.

Altos Office Executive is a multiwindow, multiuser integrated package that combines word processing, spreadsheet, data base and electronic mail applications. The product "is the first integrated office automation product to combine proven productivity tools into one integrated package in an [AT&T] Unix environment," said product manager Sandra Caldwell.

The package features Redwood Software's Uniplex word processing program, Microsoft's Multiplan, Relational Database Systems, Inc's. File-it! software and a proprietary electronic mail offering. Other features "include enhanced merge capability between applications, on-line Help facilities and instant-view menus of the four application areas and choices within each area," Caldwell said. Altos Office Executive costs $695.

The new Altos 486 is a four-user, Xenix-based system built around an Intel Corp. 80186 operating at 8 MHz. A $6,490 standard configuration includes 512K bytes of random-access memory, 20M-byte hard disk drive, 1M-byte floppy disk drive, Xenix, Altos III terminal, Worknet port, printer port and two additional terminal ports.

The menu-driven Altograf program for the Altos 186 offers printing of graphs on up to three axes simultaneously, display of more than one graph per page and logarithmic scaling, according to the vendor. It costs $295.

Altos is located at 2641 Orchard Pkwy., San Jose, Calif. 95134.

SOFTWARE

LOGITECH, INC.

Modula-2 Runtime Debugger; Release 1.1 Modula 2/86; Modula 2 ROM; utilities package

Software updates and runtime debuggers for the Modula 2/86 base language system are two of several products announced recently by Logitech, Inc.

The Modula-2 Runtime Debugger is an interactive symbolic debugger for programs produced on the IBM Personal Computer by the Modula-2/86 base language Systems 1.1 or Modula-2/VX86 cross-development system. According to the company, it allows programmers to control and examine the execution of Modula-2 programs to find software errors. The Runtime Debugger sells for $250.

Release 1.1 of Modula 2/86 reportedly provides software emulation for the support of real data type operations in addition to Intel Corp. 8087 suppport, as well as Clock and Real-conversions modules. The product is said to improve performance of the compiler, linker and programs by 50%. The product operates under IBM's PC-DOS operating system. The version sells for $75 for registered users, according to the company.

Logitech's Modula-2 Read-Only Memory (ROM) package is said to allow programmers to prepare Modula-2 programs to be burned into ROM and ROM chips to be used in systems without operating systems. The product is priced at $350.

The company's utilities package is an extension of the standard library now available with Modula-2 development systems. Decimals for integer calculations and a decoder that provides assembly language listing of Modula-2 programs are among the utilities included. The package sells for $75.

Logitech, 805 Veterans Blvd., Redwood City, Calif. 94063.

INDIVIDUAL SOFTWARE, INC.

Professor DOS

Individual Software, Inc. has announced a menu-driven tutorial package to train users on IBM's DOS 3 operating system and on the IBM Personal Computer AT's hard disk.

Professor DOS is said to teach users to build an orderly hard disk and to use smart commands and advanced DOS commands such as

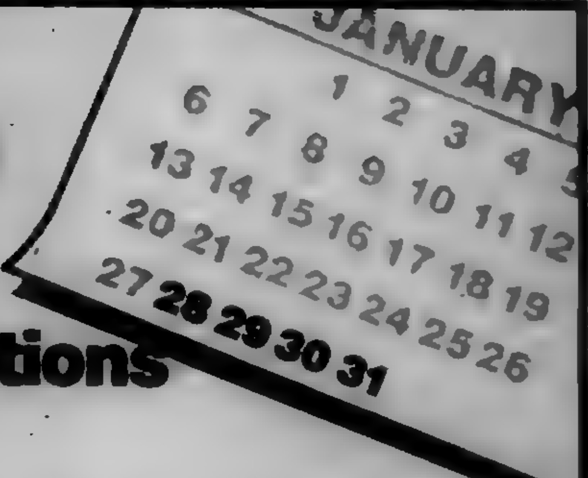
The four most important days of the new year for telecommunications users!



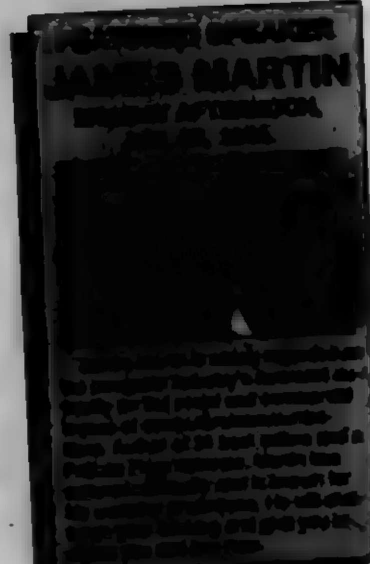
START "THE YEAR AFTER DIVESTITURE" OFF RIGHT — WITH COMMUNICATION NETWORKS '85.

This is it — America's *national* telecommunications forum — the first, the most comprehensive and the most important conference and exposition of the year. It's the Seventh Annual COMMUNICATION NETWORKS Conference & Exposition, with:

- the *largest* conference program in the industry — some 80 essential seminars, topics and presentations
- the leading industry experts, including the renowned *James Martin, Arch McGill,* FCC Commissioner *Dennis Patrick,* and some 200 other speakers and panelists
- the *biggest* exhibit in COMMUNICATION NETWORKS history, with over 200 exhibitors and 750 booths, so you can see everything the technology leaders have to offer in '85.

BEGINNING AND EXPERIENCED TELECOM PROFESSIONALS WILL BENEFIT

Whether you or your staff have been in the telecommunications field for one year or ten, you'll find COMMUNICATION NETWORKS '85 of major value. In fact, what you learn here will have a significant impact on how effectively you deal with the constant changes in telecommunications in 1985.



Attend any of the 12 introductory or advanced seminars on Monday, January 28 and, as a special bonus, you'll hear the dynamic James Martin at a special late afternoon lecture. Then choose from more than 70 conference sessions, including user-oriented topics chaired by Association of Data Communications Users members. See the latest products and services on exhibit, relax in exhibitor hospitality suites and enjoy all the attractions of Washington, D.C.

REGISTER BY DECEMBER 14, 1984 AND SAVE $50 ON EACH REGISTRATION.

Don't let anyone you know miss out on 1985's most important telecommunications event. Come for all four days, or any days you prefer, to the largest and best COMMUNICATION NETWORKS Conference ever. Register for three or four days by December 14, 1984 and save $50 on each registration.

CALL TODAY, OR SEND THE COUPON BELOW TO REGISTER.

800-225-4698

In Mass., 617-879-0700

COMMUNICATION NETWORKS CONFERENCE & EXPOSITION
Washington Convention Center, Washington, D.C., January 28-31, 1985.

Complete seminar information will be forwarded when available. Registrations cancelled later than Jan. 18 are subject to a $50.00 service charge. Registration may be transferred at no charge.

MAIL COUPON TO:
COMMUNICATION NETWORKS '85,
Box 880, Framingham, MA 01701 USA

☐ Sign me up for COMMUNICATION NETWORKS '85 as follows:	Before Dec. 14	After Dec. 14
☐ Monday Seminar (includes lunch)	$295.00	$295.00

BACKUP and RESTORE.

The product features interactive lessons on batch files, a dictionary of key terms, reference guides and a technical journal covering additional DOS features.

The program reportedly runs under all DOS versions on a minimum of 128K bytes of memory, one double-sided diskette drive and a monochrome or color display.

Professor DOS is priced at $59.95.

Individual Software, 1163-I Chess Drive, Foster City, Calif. 94404.

ANALYTICA CORP.
Reflex

Analytica Corp. has introduced its Reflex data base software for the IBM Personal Computer.

Reflex reportedly aids in the collection and retrieval of information and provides users with analytic capabilities. Under Reflex, information reportedly can be reviewed in a variety of formats, grouped, summarized and studied for trends and deviations.

The product is said to feature pull-down menus, screen windows and Help screens that can be accessed with a keystroke.

Relfex is priced at $495.

Analytica, 3155 Kearney St., Fremont, Calif. 94303.

MICROTEL, INC.
Micro-Talker I

Microtel, Inc. has introduced its Micro-Talker I, a voice mail system for the IBM Personal Computer XT.

Micro-Talker I reportedly allows up to 30 users to interface with the system from any Touch-Tone telephone. Voice prompts are said to guide users through the process of leaving and retrieving a message.

Micro-Talker requires a system with 256K bytes of internal storage and a 10M-byte hard disk.

Micro-Talker I is priced at $695.

Microtel, 4th Floor, 40 W. 27th, New York, N.Y. 1001.

RACAL-TELESYSTEMS, INC.
Linkage

Racal-Telesystems, Inc. has introduced Linkage, document translation software for the IBM Personal Computer.

Linkage reportedly translates files between the Micropro International Corp. Wordstar text editing package and IBM, Wang Laboratories, Inc. and certain other brands of word processing systems.

Under Linkage, a centralized word processing system reportedly can receive Wordstar documents prepared by several remote personal computers. The protocol into which Linkage translates can be transmitted asynchronously over voice-grade telephone lines at 300 or 1,200 bit/sec, according to the vendor.

Linkage is priced at $500.

Racal Telesystems, 410 N. Michigan Ave., Chicago, Ill. 60611.

STSC, INC.
APL Plus/PC Tools

STSC, Inc. has announced APL Plus/PC Tools, a set of software utilities for the company's APL/PC system application development system that uses the APL programming language.

The product features systems for constructing and using full screen menus and input forms, formatting reports and routing output, the firm said. APL Plus/PC Tools reportedly includes terminal emulation support for IBM 3278 terminals, file transfer capability and APL interfaces.

Other features consist of maintenance and configuration aids for program and work space searching and editing, work space documentation, work space cross-referencing and program and work space comparisions, the vendor said.

The product runs on a Personal Computer with IBM's PC-DOS 2.0 and 256K bytes of random-access memory.

APL Plus/PC Tools costs $295.

STSC, 2115 E. Jefferson St., Rockville, Md. 20852.

MAGNUM GENERAL LTD.
Metapsych

Magnum General Ltd. has introduced Metapsych, hospital management software for clinical, administrative, research and education functions of a psychiatric service.

The package reportedly includes a nine-module master clinical data base derived from a data base developed by Strain & Associates. An activity data base manages patient-related services, and a literature data base gathers data, according to the vendor.

Metapsych runs on IBM's Personal Computer, XT and AT and compatibles with 320K bytes of random-access memory, a 10M-byte hard disk, monitor, printer and an asynchronous serial communications port.

The license fee for a single package is $6,500. Licensees receive the software, users manual, and the Metafile data base manager with hardware lock.

Magnum General, 180 N. Michigan Ave., Chicago, Ill. 60601.

OFFICE SOLUTIONS, INC.
Officelink/Wang PC

Office Solutions, Inc. has introduced its Officelink/Wang PC word processor for the IBM Personal Computer.

Officelink/Wang PC is said to allow diskette transfer between the IBM Personal Computer and Wang Laboratories, Inc. Professional computers. It reportedly allows documents created on any IBM Personal Computer to be transferred to a central Wang-based word processing deparment for further editing.

BLUELYNX™ PACKS A MAINFRAME IN YOUR PC

Need access to an IBM mainframe?* BLUELYNX puts that power at your PC!

3 reasons you'll want BLUELYNX to solve **every** IBM PC/Mainframe communications problem:

1. **Technical Leader.** BLUELYNX leads the field-with products for PCs and ATs in IBM terminal environments.
2. **Ease of Use.** For example, our 3270 line of products includes the BLUELYNX 3270 Keyboard (see illustration) so terminal users are at peak productivity from day one. No retraining required.
3. **Superior Support.** A BLUELYNX tradition!

IMPORTANT!
BLUELYNX is the **only** complete family of products offering COOPERATIVE PROCESSING to get the most from your DP resources. One BLUELYNX 3270 Gateway, for example, lets 32 PC's talk to your mainframe.

Call Techland for solutions to your PC/Mainframe problems.

INQUIRE®/Text:

Helps you find what's buried in your database.

You don't have to be an Einstein to realize that numbers are only part of the data your organization needs in order to be effective. As often as not, the information you need consists of a few key phrases buried inside a mountain of written documentation.

Until recently, accessing this information was a nightmarish task, largely dependent on paper filing systems and relatively fallible human memory.

But with INQUIRE/Text, it's easy. Powerful search commands zip through everything from research reports to correspondence—extracting vital information faster and more accurately than ever before.

The result is a quantum leap in the quality and diversity of online information available for decision support. For the first time, textual information can be retrieved and manipulated as easily as numeric data—with an output of up-to-date, integrated management reports.

No wonder INQUIRE/Text users include some of the world's leading scientists and researchers —not to mention lawyers, librarians, engineers, corporate records managers, and entrepreneurs.

And no wonder more and more people everywhere are seeing text management as an indispensable element of the Information Center.

INQUIRE/Text. The only system around that can turn a mass of text into a source of energy.

For more information call or write Infodata Systems Inc., 5205 Leesburg Pike, Falls Church, Virginia 22041, telephone (800) 336-4939. In Virginia call (703) 578-3430. Telex: 899125

Officelink/Wang PC costs $195.

Office Solutions, 5708 Odana Road, Madison, Wis. 53719.

CONTROL DATA CORP.
Situation Simulation Model; Drill and Practice Lesson Model

Control Data Corp. has announced two training aids for its Plato computer-based training author system that runs on the IBM Personal Computer: Situation Simulation Model (SSM) and Drill and Practice Lesson Model (DPM).

SSM enables users to design interactive training software that simulates business situations, according to the vendor. The product reportedly features menu-driven prompts and context-sensitive Help screens.

DPM allows training professionals with no computer experience to create interactive drill and practice courseware for the Plato system, the vendor said.

SSM costs $3,000 for a one-time license fee; a one-time DPM license fee sells for $1,500. Reusable student disks are available for $25 each.

CDC, P.O. Box 0, 8100 34th Ave., Minneapolis, Minn. 55417.

MANAGEMENT CONTROL SYSTEMS, INC.
Audit Advantage

Management Control Systems, Inc. has announced Audit Advantage, auditing software for the IBM Personal Computer, Personal Computer XT, Personal Computer AT and Compaq Computer Corp. microcomputers.

Audit Advantage is said to process annual, semiannual, trimester and quarterly audits. It includes six levels of operator password security, the vendor said. The product allows accountants to print or view financials on the CRT screen, automatically prepare analytical reviews using predefined and user-defined business rations and produce draft financial statements, the vendor said.

Minimum system requirements are a 256K-byte main memory and a 10M-byte fixed disk.

The price of Audit Advantage is $3,000, the vendor said.

Management Control Systems, 8701 Buffalo Ave., Niagara Falls, N.Y. 14304.

EDEN PRESS
Privacode

The Eden Press has introduced Privacode, file encryption software for the IBM Personal Computer.

Privacode reportedly is compatible with such programs as Lotus Development Corp.'s 1-2-3, Ashton-Tate's Dbase II and Micropro International Corp.'s Wordstar. It also encrypts files developed using those programs.

Privacode also includes a security module that automatcally erases the source version of a file when the file is translated from clear text to secured versions, according to the vendor.

Privacode is priced at $395.

Eden Press, P.O. Box 8410, Fountain Valley, Calif. 92728.

MICRO MRP, INC.
MAX, the Production Manager

Micro MRP, Inc. has announced that its inventory control and planning software is available for an IBM Personal Computer AT with a hard disk and the IBM's PC-DOS 3.0 operating system.

MAX, the Production Manager is a manufacturing resource planning system consisting of six modules that provide bill of materials control, inventory control, master scheduling, materials requirement planning, purchasing control and shop floor control.

The price of MAX is $16,000.

Micro MRP, 1065 E. Hillsdale Blvd., Foster City, Calif. 94404.

UNIPLEX INTEGRATION SYSTEMS
Uniplex II

Uniplex Integration Systems has announced an integrated applications software package for standalone or multiuser AT&T Unix-based micro and minicomputer systems.

The system includes a word processor, spreadsheet package and relational data base management system. Features include a menu system, screen builder, key function definer, print spooler, electronic mail and an application generator, according to the vendor.

Price of the Uniplex II software system ranges from $600 for the Altos Computer Sytems, Inc. Altos 586 to $4,000 for the Digital Equipment Corp. VAX-11/780.

Uniplex Integration Systems, Suite 500, No. One Galleria Tower, 13355 Noel Road, Dallas, Texas 75240.

INFOCENTER SOFTWARE
Ilink for 3270-PC

Infocenter Software has announced that its Ilink micro-mainframe formatter can be used with the recently enhanced IBM Application Program Interface (API) for the IBM 3270 Personal Computer.

Ilink can download, upload and cross-load files between information center products running on IBM mainframes and data base or spreadsheet applications on IBM Personal Computers. API will allow steps of a data conversion process to be automated so that Ilink procedures will appear transparent, the company said. Downloading procedures can then be accomplished with a single command, the vendor said.

Base price of the mainframe Ilink module is $12,500 for a configuration of 10 Personal Computers.

Infocenter Software, 171 Main St., New Paltz, N.Y. 12561.

U.S. DATA CORP.
Factory Link; Flexus Industrial Operator Station enhancements

U.S. Data Corp. has announced Factory Link, software that provides programmable controller communications and electronic spreadsheet interfacing between IBM 5531 computers and IBM Personal Computer XTs

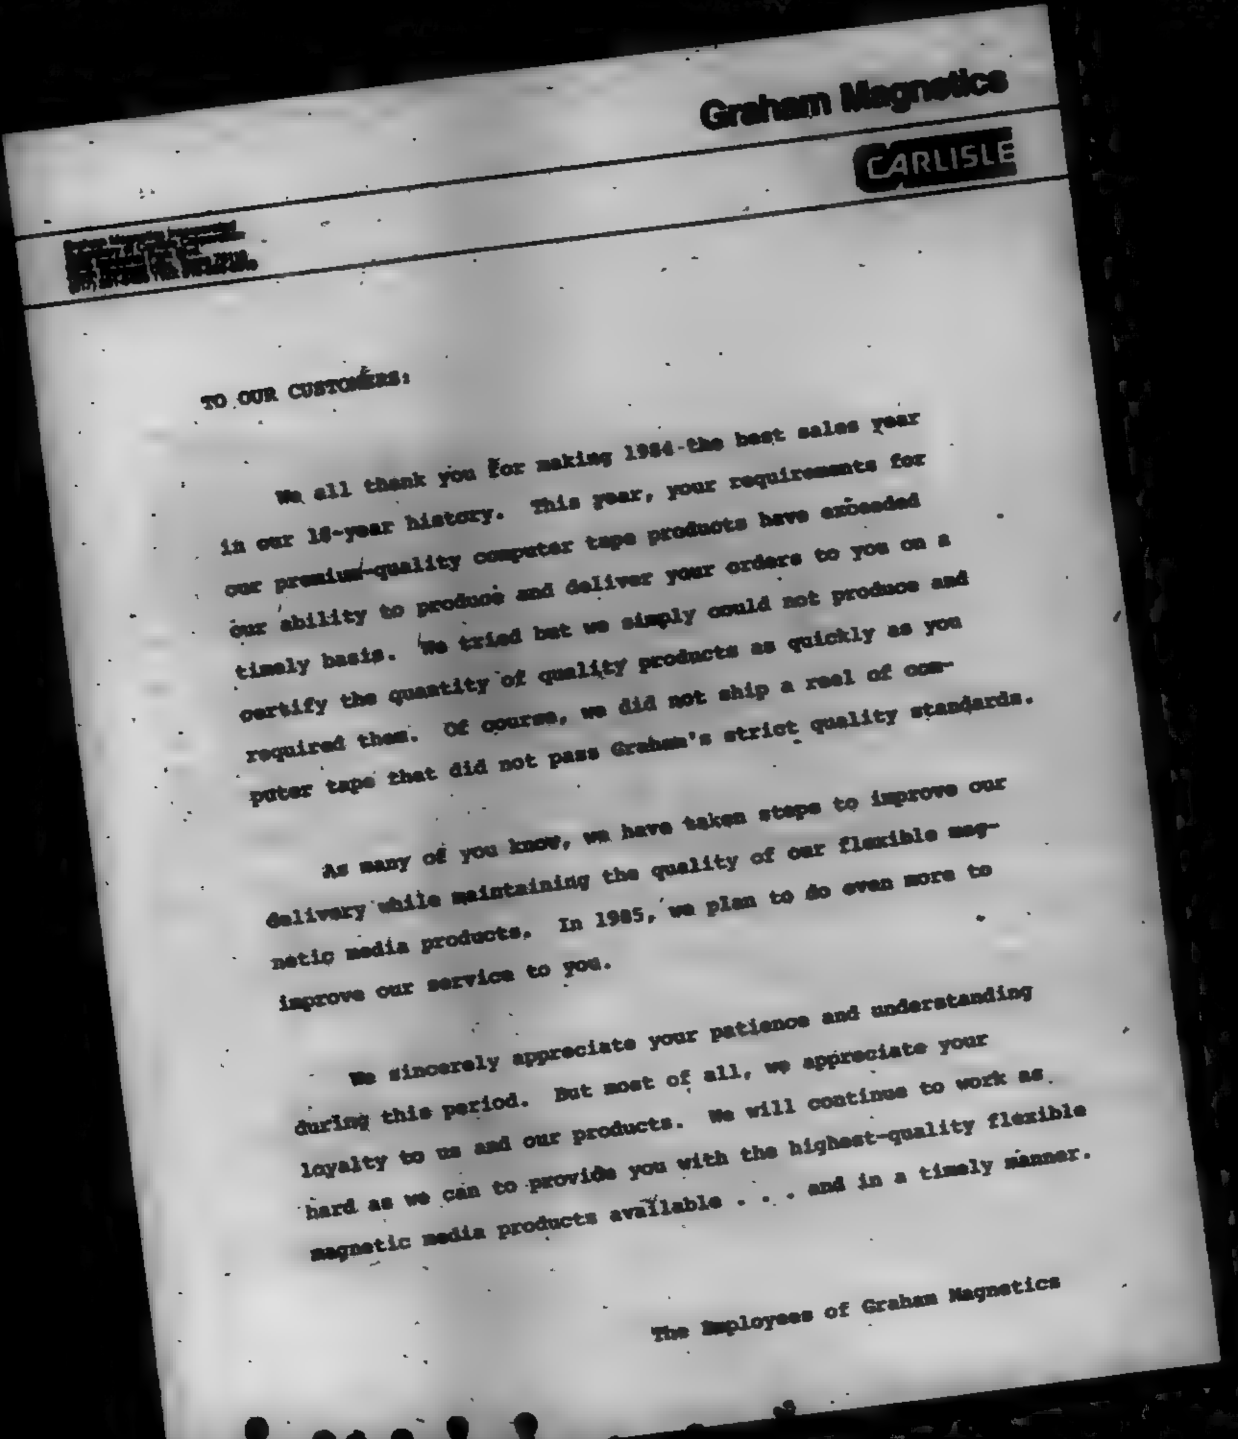
ACR
THE EDP INFORESOURCE

Thank You!



Graham Magnetics
CARLISLE

TO OUR CUSTOMERS:

We all thank you for making 1984 the best sales year in our 18-year history. This year, your requirements for our premium-quality computer tape products have exceeded our ability to produce and deliver your orders to you on a timely basis. We tried but we simply could not produce and certify the quantity of quality products as quickly as you required them. Of course, we did not ship a reel of computer tape that did not pass Graham's strict quality standards.

As many of you know, we have taken steps to improve our delivery while maintaining the quality of our flexible magnetic media products. In 1985, we plan to do even more to improve our service to you.

We sincerely appreciate your patience and understanding during this period. But most of all, we appreciate your loyalty to us and our products. We will continue to work as hard as we can to provide you with the highest-quality flexible magnetic media products available . . . and in a timely manner.

The Employees of Graham Magnetics

running IBM's PC-DOS operating system.

The package reportedly allows bidirectional communications between the programmable controller and the industrial personal computer. The package allows users to access data from programmable controllers and generate reports and graphics using microcomputer packages such as Lotus Development Corp.'s 1-2-3 or Symphony.

Fill-in-the-blank instructional displays allow communications port setup and programmable controller memory access. U.S. Data has also announced enhancements to its Flexus Industrial Operator Station's operating system software.

The enhancements include a block transfer mode and a polled protocol feature.

Factory Link costs $2,995.

U.S. Data, 1551 Glenville Drive, Richardson, Texas 75085.

LANTECH SYSTEMS, INC.
Tool Kit

Lantech Systems, Inc. has introduced a software developer's tool kit for the IBM Personal Computer.

Called Tool Kit, the software reportedly provides a choice of text editors, a terminal emulator and windowing capability. The Tool Kit also provides a choice of three editors: the Bell Editor, VI Editor and ED Editor, the firm said.

Tool Kit also reportedly includes Lantech's Unetix, the Unix-compatible multitasking operating system.

Tool Kit is priced at $400.

Lantech Systems, 9635 Wendell Road, Dallas, Texas 75243.

MICRORIM, INC.
Enhanced Clout

Microrim, Inc. has announced an enhanced version of its Clout natural language query designed to work with files from software programs such as Lotus Development Corp.'s 1-2-3, Ashton-Tate's Dbase II and Software Publishing Corp.'s PFS:File.

Enhanced Clout also works with Data Interchange Format files, Sylk files from Microsoft Corp.'s Multiplan and mainframe Ascii files, Microrim said.

Clout's relational ability is said to merge and cross-reference information from different files and automatically scan up to 40 files and join up to five files to answer a question.

Clout requires a minimum of 256K bytes of memory and either IBM's PC-DOS or Microsoft's MS-DOS operating systems.

The price for Clout is $240.

Microrim, 3380 146th Place S.E., Bellevue, Wash. 98007.

SYSTEMS

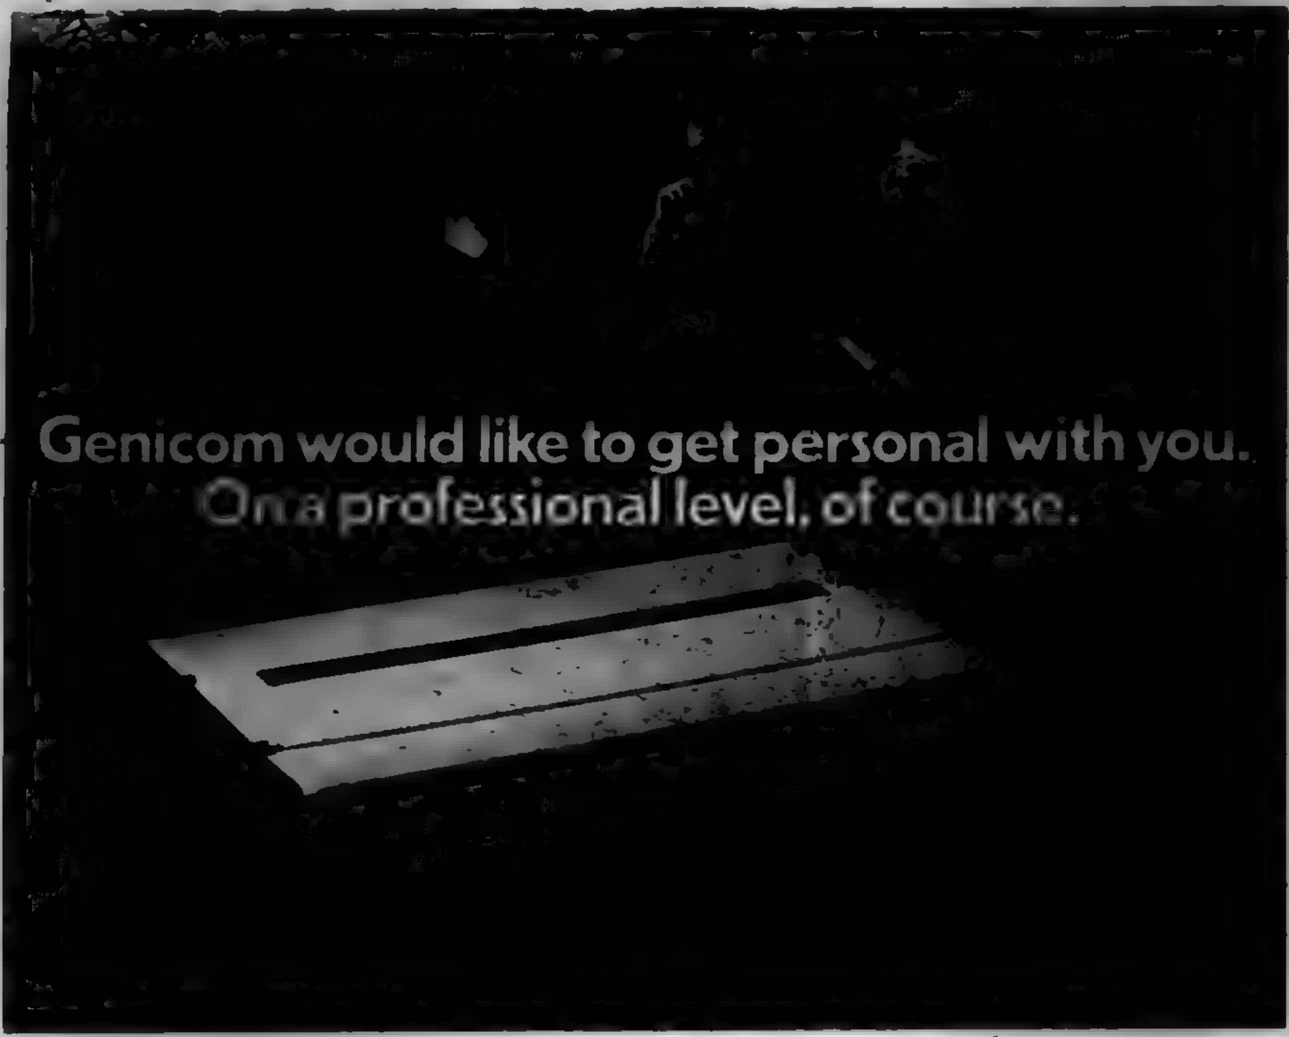
GENERAL DATA SECURITY SYSTEMS
Computer Intelligence Access

General Data Security Systems, a subsidiary of General Security Systems, Inc., has introduced its Computer Intelligence Access data security software system for the IBM Personal Computer and Personal Computer XT.

Computer Intelligence Access reportedly offers program and file protection and confidentiality of information. A multilevel password access feature is said to allow the system administrator to delegate files to users.

Also included are a protection system that prevents any user from erasing or deleting a protected file and an updated inventory list of all files, according to the ven-

Continued on page 128



Genicom would like to get personal with you.
On a professional level, of course.

Personal computers have become a valuable asset in business. The problem is that most personal computer systems are originally sold with "personal printers"...printers built for home use, not for heavier business work.

These "personal printers" are too slow for many business needs. They can tie-up your computer for extended periods of time...time you could be using to do other work.

Another problem is durability. In business, you need a printer that can produce high volume output over a long duty cycle. The common "personal printer" will often just quit under such continuous operation.

That's why Genicom has created the 3014, 3024, 3304 and 3404...professional printers built for personal computers.

Price/performance matched for small business systems, the Genicom 3000 PC printers are designed to increase productivity and maximize the value of your personal computer.

The 3000 PC printers provide 160-400 cps draft, 80-200 cps memo, and 32-100 cps NLQ printing...performance for both high productivity and high quality printing.

The 3014/3024 models print 132 columns. The 3304 and 3404 models give you a full 136 column width, and offer color printing as well.

Each printer is easy to use, lightweight, functionally styled and attractive. And you can choose options from pedestals and paper racks to document inserters, sheet feeders and 8K character buffer expansion, plus more.

Genicom 3000 PC printers feature switch selectable hardware, dual connectors and dual parallel or serial interfaces. Plus the 3014 and 3024 emulate popular protocols for both Epson MX with GRAFTRAX-PLUS™ and Okidata Microline 84 Step 2™, while the 3304 and 3404 emulate popular protocols for Epson MX with GRAFTRAX-PLUS™. So your current system is most likely already capable of working with these Genicom printers without modification.

Most important, the Genicom 3000 PC printers are quality-built, highly durable printers designed for rapid, continuous duty cycle printing. So take some personal advice. Get a Genicom professional printer for your personal computer today.

CONTINENTAL RESOURCES.

One company. All the answers.

Whether you're adding high-tech products to your company for the first time or upgrading an existing system, you have a choice: You can deal with multiple vendors, conflicting claims, long lead times, and poor service — or you can call Continental Resources.

Whether you're looking for a personal computer, dumb terminal, disk drive, high-speed line printer, data communications equipment, or an advanced graphics system, Continental has the answer. Products of almost every description from virtually every industry leader:

- Anderson Jacobson
- CDC
- Computer Devices
- CIE Terminals
- Digital Equipment
- Diablo
- Data Products
- General Data Comm (or GDC)
- Genicom (G.E.)
- IBM
- Lear Siegler
- Micom
- NEC
- Northern Telecom
- Texas Instruments
- Teletype
- Ventel
- Visual Technology

But Continental doesn't just offer great selection. We provide a total support package unmatched in the industry. Not sure of what you need? Our specialists will evaluate your needs and recommend the right system for you. **And that means software, too. And supplies like ribbons, printwheels, and paper — even complete work stations.**

In short, you're guaranteed the most informative, professional assistance available — before and after your purchase. And Continental even provides complete on-site service.

Our national network of offices provides sales, technical and service support backed by more than 20 years of experience.

Even if you're not ready to buy, Continental offers a host of rental or leasing options — one is sure to meet your needs. So call us the next time you need high-tech products or services. Continental Resources is the one company with all the answers. **We deliver what you need.**

dor.

Computer Intelligence Access requires 256K bytes of random-access memory and is priced at $300.

General Data Security Systems, 1127 Loma Ave., Long Beach, Calif. 90804.

APPLIED DATA SYSTEMS, INC.

Vectorscan enhancements

Applied Data Systems, Inc. has introduced a series of enhancements to its Vectorscan 512 color graphics system.

The Vectorscan 512, reportedly now offers memory expansion from 128K bytes to 512K bytes; a business graphics package, providing line, pie and bar charts; and a long-persistence color monitor.

The color monitor is priced at $800. The memory expansion option is priced at $400. The business graphics reporting package is priced at $450.

Applied Data Systems, Suite 213, 9811 Mallard Drive, Laurel, Md. [illegible]

COMPUPRO SYSTEMS, INC.

Compupro 10 Plus

Compupro Systems, Inc. has introduced the Compupro 10 Plus, a low-end addition to its line of multiuser business systems.

The Compupro 10 Plus is said to be a four-user microcomputer with such features as concurrent execution of both 8- and 16-bit software and networking capabilities. The Compupro 10 Plus uses the Digital Research, Inc. Concurrent CP/M 8/16 operating system and is said to come bundled with a word processing program that resembles Micropro International Corp.'s Wordstar.

The Compupro 10 Plus is priced at $4,995.

Compupro, 3506 Breakwater Court, Hayward, Calif. 94545.

COMMUNICATIONS

ZSTEM COMMUNICATIONS

Zstem EMPC-VT100

Zstem Communications, a division of KEA Systems, Ltd., has introduced its emulator of the Digital Equipment Corp. VT100 terminal for use with the IBM Personal Computer and the Zenith Data Systems, Inc. personal computer series.

The product, the Zstem EMPC-VT100, reportedly is available in speeds from 45.5K bit/sec to 38.4K bit/sec and supports both DEC VT52 and VT100 escape sequences, shifted and alternate keypad mode. All DEC VT52 and VT100 cursor-related functions, including application cursor keys, erasing and editing, scrolling regions, printer status, printer controller and print screen sequences, are also supported, according to the vendor.

The product is priced at $150, the vendor said.

Zstem Communications, KEA Systems, 311-811 Beach Ave., Vancouver, British Columbia V6Z 2B5.

INNOVATIVE ELECTRONICS, INC.

PC-80

Innovative Electronics, Inc. has announced PC-80, a communications board for the IBM Personal Computer.

The product uses an IBM Type A coaxial connection to attach a Personal Computer to an IBM 3274 or 3276 cluster controller or 4331 display or printer adapter, according to the vendor. PC-80 reportedly supports Binary Synchronous Communications or Systems Network Architecture/Sychronous Data Link Control communications protocols.

The product features dual-level password security, concurrent microcomputer and mainframe sessions, configurable Help screen and screen capture facility, Innovative Electronics said.

PC-80 costs $895.

Innovative Electronics, 4714 N.W. 165th St., Miami, Fla. 33014.

AMBI CORP.

Ambimail

Ambi Corp. has introduced its Ambimail electronic mail software for its Ambiset workstation.

The Ambimail system reportedly allows Ambi products to send and receive text messages with a single keystroke, communicate voice, data and text in unattended operation and transmit information to multiple addresses on a variety of distribution lists stored in memory.

Ambimail is said to offer point-to-point and point-to-multipoint messaging and to integrate with the clock/calendar of Ambi workstations, allowing them to send and receive messages while unattended.

Ambimail is priced at $300.

Ambi, 1033 Washington Blvd., Stamford, Conn. 06901.

WATERLOO MICROSYSTEMS, INC.

Waterloo Port

Waterloo Microsystems, Inc. has introduced Waterloo Port, an operating system that reportedly provides multitasking and networking to the IBM Personal Computer, Zenith Data Systems Corp. 150 and 160, and Compaq Computer Corp. Compaq personal computers.

Waterloo Port reportedly features concurrent activities, a mouse-driven user interface, integrated local-area networking and the use of IBM's PC-DOS as a concurrent activity.

The product is also said to offer a hierarchical tree-structured file system, a set of editing and formatting tools, an environment for developing systems and application software and an interprocess, message-passing system architecture.

Waterloo Port Version 2.1 reportedly includes a network interface board and documentation. It is priced

at $515 in its stand-alone version. A one-network server version costs $1,540.

Waterloo Microsystems, 175 Columbia St. W., Waterloo, Ont., Canada N2L 5Z5.

GRANADA SYSTEMS DESIGN, INC.
PC/Sail

Granada Systems Design, Inc., has announced a software and hardware package that allows the IBM Personal Computer to act as a protocol translator that will transmit information from asynchronous devices to IBM System/34, 36 and 38 users.

PC/Synchronous/Asynchronous Interactive Link (Sail) reportedly uses the Personal Computer and an IBM 5251 Model 12 synchronous protocol to communicate between asynchronous devices and IBM systems.

The product, which consists of two micro hardware boards and a software diskette, sells for $1,650.

Granada Systems Design, 303 Fifth Ave., New York, N.Y. 10016.

PRINTERS/PLOTTERS/PERIPHERALS

PRINTEK, INC.
Model 930

Printek, Inc. has announced a series of options for its Model 930, a 200 char/sec dot matrix printer.

The options include several new fonts, memory expansion and print buffer. The fonts consist of pica/pica italic, elite/elite italic, courier/courier italic and optical character recognition Ansi (OCRA) and optical character recognition International Standards Institute (OCRB).

The fonts are priced at $99 each, except for the OCRA and OCRB fonts, which cost $49.

A memory expansion board, which supports all new fonts and fonts downloaded from a larger computer, costs $99. A 6K-byte print buffer runs $149.

Printek, 1517 Townline Road, Benton Harbor, Mich. 49002.

BOARD-LEVEL DEVICES

TSENG LABORATORIES, INC.
Colorpak

Tseng Laboratories, Inc. has announced Colorpak, a color graphics board for the IBM Personal Computer.

According to Tseng laboratories, Colorpak provides 640- by 400-pixel four-color resolution and it also supports 80-char. by 50-line displays.

In conjunction with the IBM color monitor, the product reportedly supplies 640- by 200-pixel resolution or 320- by 200-pixel resolution on an 80-char. by 25-line display.

The color graphics board product includes Grafix Partner, a graphics enhancement program that reportedly improves the graphics for Lotus Development Corp.'s 1-2-3. Grafix Partner runs in background and can be accessed by a single keystroke, Tseng Laboratories said.

The price of the Colorpak color graphics board is $580.

Tseng Laboratories, 205 Pheasant Run, Newtown, Pa. 18940.

SKY COMPUTERS, INC.
SKY320

Sky Computers, Inc. has introduced an arithmetic and I/O coprocessor for the IBM Personal Computer based on the Texas Instruments, Inc. TMS 320 processor.

The SKY320 coprocessor is said to be a single add-in board with up to 128K-bytes of 120 nsec four-ported memory.

The SKY320 performs arithmetic at up to 5 million operation/sec, using overlapped additions and multiplications, according to the vendor.

The coprocessor reportedly can be accessed from the Personal Computer, the TMS320 and two auxiliary 16-bit I/O ports operating independently of the Personal Computer's 8-bit bus.

The SKY320 is priced at $2,995.

Sky Computers, Foot of John St., Lowell, Mass. 01852.

SIGMA INFORMATION SYSTEMS, INC.
PC-128

Sigma Information Systems, Inc. has introduced its PC-128 motherboard, a product said to be fully hardware- and software-compatible with the IBM Personal Computer XT.

The PC-128 reportedly offers 128K bytes of internal memory and a 16-bit Intel Corp. 8088 CPU that can address up to 864K bytes of system memory. Its eight I/O interface slots are said to be IBM-compatible and able to support IBM disk controllers, multifunction boards and modems.

The PC-128 also is said to include eight extended read-only memory (ROM) sockets for use with either eight 8K-byte or eight 16K-byte erasable programmable ROM chips. It also reportedly includes a speaker port.

PC-128 is priced at $582.

Sigma Information Systems, 3401 E. LaPalma Ave., Anaheim, Calif. 92806.

REMOTE SYSTEMS, INC.
Secureware III

Remote Systems, Inc. has introduced Secureware III, a security system for the IBM Personal Computer and Personal Computer XT.

Secureware III is mounted into a card slot in the computer and is addressed by the processor as an I/O device.

It reportedly reduces the potential for software diskette piracy and can be programmed to work with hard-disk-based systems.

In a network, Secureware III is said to offer data file security and a reliable method of user validation for access to a host computer.

Secureware III is priced at $195, the vendor said.

Remote Systems, 38 Cessna Court, Gaithersburg, Md. 20879.

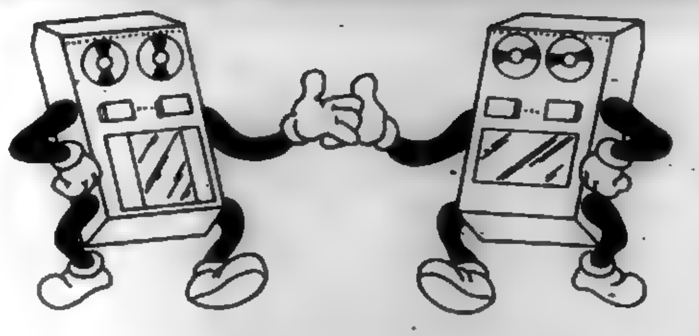
OUR SWITCHES MAKE YOUR IBM SYSTEMS WORK LIKE A TEAM!



If you have more than one IBM or plug compatible processor, Digital can help you get the most for your hardware investment. Our switches allow you to achieve backup and peripheral configuration flexibility at a fraction of the cost you're probably thinking.

Whether you have two processors or more, Digital has a switch to suit your requirements.

- Model 4101 The lowest priced matrix switch on the market.
- Model 3421 The only manually operated channel switch in the industry.
- Model 3403 A remote controlled channel switch designed for underfloor installation.

BOARD

from page 130

AST RESEARCH, INC.
Advantage

AST Research, Inc. has introduced Advantage, a multifunction memory expansion board designed for the IBM Personal Computer AT.

Advantage allows a user to work with up to 3M bytes of random-access memory and takes advantage of the AT's high-performance bus, AST Research said. The board reportedly works with either 64K-bit or 256K-bit chips. Advantage is said to offer an IBM-compatible parallel printer port, two serial ports and a game port.

Advantage costs $495.

AST Research, 2121 Alton Ave., Irvine, Calif. 92714.

WAVE MATE, INC.
Bullet-286

Wave Mate, Inc. has introduced its Bullet-286 motherboard for the IBM Personal Computer XT. The product is said to incorporate the Intel Corp. 80286 microprocessor while maintaining IBM compatibility.

The Bullet-286 reportedly has the same dimensions and physical connections as the Personal Computer XT motherboard and provides up to 640K bytes of on-board memory with zero wait states. According to Wave Mate, the product uses virtual machine emulation to resolve the Intel Corp. 90286/Intel 8088 compatibility problems.

Virtual machine concepts are said to permit Personal Computer XT application and system programs to be treated as black box object-code modules, which require no modification to achieve Intel 8086 functionality.

The Bullet-286 is available in 256K-byte, 512K-byte and 1M-bytes models, priced from $1,995 to $3,395.

Wave Mate, 14009 S. Crenshaw, Hawthorne, Calif. 90250.

QUADRAM CORP.
Pallette Master

Quadram Corp. has unveiled Palette Master, a high-resolution graphics adapter for IBM's Personal Computer.

Pallette Master reportedly can display 256 from 256,000 possible colors on the screen, Quadram said. The product is said to feature 64K bytes of memory and 320- by 200-pixel resolution.

Pallette Master reportedly allows a user to store, transmit, recall and manipulate photographic-quality images. The product is compatible with software written for the IBM Personal Computer color graphics adapter.

Pallette Master costs $695.

Quadram, 4355 International Blvd., Norcross, Ga. 30093.

INTELLUTION, INC.
Eprom for IBM Personal Computer

Intellution, Inc. has announced a graphics character erasable programmable read-only memory (Eprom) product for the IBM Personal Computer.

The product plugs into an IBM Personal Computer color graphics board and provides 86 graphics symbols including valve bodies, valve actuators, motors, pumps, corners, transmitters, ladder diagram symbols, bar graphs and process vessels, according to the vendor.

The product costs $70, the vendor said.

Intellution, Suite F, 35 Perwal St., Westwood, Mass. 02090.

SEATTLE TELECOM & DATA, INC.
Model PC-286

Seattle Telecom & Data, Inc. has introduced an add-in processor board for IBM Personal Computers that reportedly can increase the processing speed of the Personal Computer and Personal Computer XT by 10 times.

The PC-286 reportedly takes over the Personal Computer bus completely, generating all Intel 8088 timing internally and running software without the need for special software disks, input and output port address switches or jumpers.

The PC-286 can run at 4, 6 or 8 MHz, permitting it to be tailored to scientific and engineering applications, the vendor said. Additionally, the PC-286 CPU, its on-board expansion connector and IBM Personal Computer bus all are said to have independent access to the board's main memory.

The PC-286, with 256K bytes of random-access memory, is priced at $2,395.

Seattle Telecom & Data, 3637 151st Place N.E., Redmond, Wash. 98052.

DIGIGRAPHIC SYSTEMS CORP.
Com-8 board

Digigraphic Systems Corp. has introduced its Com-8 multichannel communications board for the IBM Personal Computer AT and other IBM Personal Computers.

The Com-8 board fits into an expansion slot on the Personal Computer's chassis and adds eight individually addressable serial ports. It also allows Com-8 boards to be chained together to enable a system to support as many terminals as permitted by the computer's memory.

The Com-8 board is $629.

Digigraphic Systems, 10873 Yellow Circle, Minnetonka, Minn. 55343.

INTELLIGENT TECHNOLOGIES INTERNATIONAL CORP.
Coax Exchange graphics option

Intelligent Technologies International Corp. has added a graphics option to Coax Exchange, a communications board for the IBM Personal Computer line.

With the option, a Personal Computer reportedly can emulate an IBM 3279 Model S3G color graphics terminal. The microcomputer can then emulate all 3279 text and graphics display modes, with color quality, screen painting, image aspect ratio and 720- by 396-pixel resolution,

Continued on page 134

BLUE from page 119

York.

However, Weiss agreed with James Renalds, analyst with Dataquest, Inc. in San Jose, Calif., that the introductions do not address some major incompatibility issues among low-end IBM software.

Among other items in the flood of Oct. 25 announcements, the main enhancements to the Personal Computer/370 series included the new Personal Computer AT/370, 3278 (rather than 3277) terminal emulation as standard and a new release of the VM/PC system software.

Experts noted that the new AT/370 is a logical step up from the Personal Computer XT/370, with greater processing speed and memory capabilities. But several analysts described the target market for both machines as very small.

New control programs for the 3270 Personal Computer, which also made their debut Oct. 25, included application program interface services that reportedly will enhance communications between Personal Computer and host sessions. The services also will "automate, customize and simplify many functions that were previously available only through operator procedures," according to IBM.

Simplifying the user interface would help to overcome one major handicap for the 3270 Personal Computer, whose sales "are off to a slow start," Weiss said. His firm's surveys found two remaining marketing obstacles: pricing and the requirement for a 3274 controller with four ports.

When users compared the 3270 Personal Computer with a standard Personal Computer with 3270 emulation options, "in more cases than not they felt they were not getting that much more with the 3270 [Personal Computer]," Weiss said. The demand for multiple host sessions was the critical criterion justifying the additional cost of the 3270 Personal Computer, he said.

ADAPT from page 119

an organizational, not an individual, problem.

Automation's threat

In many ways the manager's complaint is similar to those heard on the production line when factory automation comes through the door.

Automation is threatening because it changes the work environment.

Very frequently the changes that are implied by office automation for managers and professionals raise the issue of perceived status.

Managers see themselves taking on functions that were formerly accomplished by secretaries. Secretaries can be used more effectively, throughput is improved and many more tasks can be accomplished in shorter periods of time, but those facts seem to be of no consequence.

In the future, managers and professionals who refuse to use automation aggressively will find themselves left behind by their counterparts.

Cityscape in alternative resources: solar, wind and geothermal technologies are applied to maximize energy efficiency. Solar panels form windbreaks which rotate parallel to desert surface; temperatures of air and water supplies are maintained by flow through buried conduits.

If You Can Imagine It...

CYBER Can Run It.

It's true. The uses of the CYBER 180 computers are limited only by the breadth of the human imagination.

So the question is not whether you could benefit from this kind of computer power. The question is, does a CYBER fit your budget?

To this question, Control Data has developed an astonishing new answer.

Introducing the Supermini 810.
The new 64-bit word Supermini 810 does everything you'd expect of a supermini system. But that is only the beginning.

In terms of all the usual criteria — performance, application portability, compatible growth potential, ease of installation and the increasingly sensitive matter of security — the Supermini 810 represents some very impressive technology.

But the most impressive aspect of this new supermini computer system may be its price.

The incredible $250,000 system.
Actually, a Supermini 810 could run less than $250,000.

And, we're not talking some barebones unit either. We're talking about a state-of-the-art supermini system, complete with operating software and peripherals, up and running. The more you learn about the system the better that price looks.

CYBER power begins where other systems reach their limits.
You can look at the Supermini 810 as the ultimate supermini computer system. It's exciting enough in those terms. But it is *only* the entry point to a compatible family of systems that boasts a 1-to-60 performance range. That is the largest compatible growth path in the industry.

So when you look beyond today and see the potential to accommodate growth, you can really appreciate the significance of this new system.

With the CYBER 180 performance range you can, if you wish, enter fully into supercomputing. You can expand your computing power as your future needs warrant. And you can do it in an orderly fashion, and at manageable costs, without massive operational disruptions.

You can start with a call or letter.
We hope what you've learned so far will stimulate you to explore the possibilities presented by the Supermini 810. You can do that by calling 1-800-253-4004 ext. 146. (In Minnesota, 1-612-921-4400 ext. 146). Or by writing Computer Systems Marketing, Control Data Corporation, P.O. Box 0 HQW09G, Minneapolis, MN 55440.

CONTROL DATA

Addressing society's major unmet needs as profitable business opportunities.

according to the vendor. A single keystroke is said to allow a user to toggle between microcomputer and mainframe sessions.

The graphics option costs $1,395, and the Coax Exchange sells for $1,195.

Intelligent Technologies International, 151 University Ave., Palo Alto, Calif. 94301.

EMULEX CORP.

PC/Memory Plus Clock; PC/Short Memory

Emulex Corp. has introduced its PC/Memory Plus Clock board and its PC/Short Memory board for the IBM Personal Computer line.

The PC/Memory Plus Clock is said to be a full-size, multifunction circuit board capable of supporting up to 576K bytes of socketed random-access memory in a single Personal Computer slot. It automatically stamps users' files with the time and date and features an on-board five-year battery, Emulex said.

The PC/Short Memory Board is available in five increments of 64K bytes each and fits into the short memory slot of the Personal Computer XT or Portable Personal Computer.

The PC/Memory Plus Clock is priced at $345 in its basic 64K-byte version. Prices range up to $1,145 for the 576K-byte version. The PC/Short Memory board is priced from $259 for the 64K-byte version to $759 for the 384K-byte board.

Emulex, P.O. 6725, 3545 Harbor Blvd., Costa Mesa, Calif. 92626.

2000 from page 119

three different documents or use the windows to display information from a variety of spreadsheet programs.

■ Calculator. Users can perform calculations within documents while editing, using Wordstar 2000's math option.

The 2000 software line also includes proportional spacing; printer support for more than 100 printer models; a typewriter mode for addressing envelopes and filling out forms directly from the computer keyboard; spelling correction, which corrects misspellings and typographical errors and provides phonetic correction; sorting; and automatic paragraph reformatting, the firm said.

Wordstar 2000 Plus contains all the features of Wordstar 2000 as well as telecommunications capabilities, a mailing list data base and an indexing system, Micropro said.

The 2000 line will be shipped in late November and will be available for the IBM Personal Computer, Personal Computer XT, Personal Computer AT and fully compatible systems under IBM's PC-DOS 2.0, 2.1 and 3.0. The programs require 256K bytes of random-access memory (320K bytes for PC-DOS 3.0 and the AT). The company recommends the use of a hard disk drive.

The Wordstar line includes a copy protection scheme that allows users to make three copies of the program. According to Micropro, the copy protection will be transparent to users with hard disk drives, while users with floppy-disk-based systems will be required to load in a program disk each time they use Wordstar 2000.

Wordstar 2000 costs $495 and Wordstar 2000 Plus is priced at $595. Upgrades are available for current users at a cost of $250 for Wordstar 2000 or $350 for Wordstar 2000 Plus.

Micropro President H. Glen Haney emphasized the fact that the company will continue to support and enhance the original Wordstar as part of a two-pronged attack on the word processing market. "We want to crowd out all the competition at the low end and block out the competition at the top," he said.

In general, analysts agreed that Micropro has addressed many of the shortcomings of the original Wordstar and added features that will be welcomed by users.

Robert Lefkowitz, a software analyst with Infocorp, a Cupertino, Calif.-based market research firm, said that in designing Wordstar 2000, Micropro "has been as successful as anyone can be at solving two problems that work against each other: providing full functionality as well as ease of use."

Bonnie Digrius, a software analyst with Cupertino, Calif.-based Creative Strategies International, Inc., said the new packages are priced too high.

Digrius also questioned Micropro's claim that the new software line will appeal to a wide variety of users — from the executive who has limited word processing needs to the professional whose needs are extensive.

For more information, Micropro International is at 33 San Pablo Ave., San Rafael, Calif. 94903.

GEM from page 119

tasking operation under future operating system offerings.

GEM will require 256K bytes of random-access memory, two floppy disk drives, a bit-mapped display, a mouse and MS-DOS 2.0 or later. Existing MS-DOS applications will run under GEM without any changes in performance, Digital Research said.

A GEM programmer's toolkit for the IBM Personal Computer will be sold to software developers in the first quarter of 1985, priced in the $500 range, Digital Research said.

The supplier suggested that Macintosh software developers will use GEM as an easy way to port packages from the MS-DOS environment.

DRI also introduced the first GEM software application, GEM Desktop, said to eliminate the need for MS-DOS commands. The screen shows a graphics representation of a desktop with icons and windows, and all commands can be achieved by pointing and selecting with a mouse, DRI said. Up to six desk accessories (such as a calculator) fit within Desktop. An OEM package, GEM Desktop is scheduled for first-quarter 1985 shipment.

The company also is slated to announce several GEM presentation graphics products. Among these, the GEM Draw and GEM Wordchart application software packages will be priced in the $300 range and will be shipped in the first quarter of 1985, Digital Research said.

Digital Research is located at 60 Garden Court, Monterey, Calif. 93942.

Introducing
Computerworld Argentina.

Computerworld Argentina is *Computerworld's* new sister publication serving the Argentine computer community.

Argentina presently has approximately 2500 general purpose computers. CPU installations are growing at 25% annually and the market for minicomputers and terminals is growing even faster. Argentina's growing industrial and educational needs insure continued EDP growth in the upcoming years.

Computerworld Argentina reports on this market with coverage of the latest local and international developments in hardware (micros, minis and mainframes), software and services, and office automation. A tabloid published twice-monthly, *Computerworld Argentina* is circulated to 5,000 professionals in the DP-related community.

CW International Marketing Services is your one-stop advertising service to countries all around the computer world. For more information on *Computerworld Argentina*, just fill out and return the coupon below.

COMPUTER INDUSTRY

Prime chief sees 'sharp focus' as key

By Peter Bartolik
CW Staff

NATICK, Mass. — Three years ago next month, Prime Computer, Inc. named as its president a former IBM vice-president, Joe M. Henson. This filled a five-month void created by the sudden departure of former President Kenneth G. Fisher, who had groomed the 32-bit superminicomputer vendor from practically start-up level to annual revenues in excess of $300 million.

The trade of a charismatic, hard-charging Fisher for someone mentored in the conservative style of Big Blue was expected to result in cultural changes at a relatively small company that had soared on annual sales increases of 75%.

Changes there were. Newly appointed President Henson wanted a more mature organization geared toward long-term growth and prosperity. Following the typical pattern of IBM personnel tapped to head other companies, he brought in a cadre of fellow IBM employees to bring the organization into line. He increased research and development spending, which, combined with shortfalls in revenue, produced a profit decline from $44.9 million in 1982 to $32.5 million in 1983. Topping things off, Fisher announced the formation of Encore Computer Corp. in mid-1983 and tapped three Prime vice-presidents and three mid-level managers, which compounded a vast exodus among management ranks.

The departure of people who had grown with the company, the imposition of a broad-based strategy on a relatively small, specialized company and the erroneous revenue forecasts for the first two quarters of last year all combined to generate an impression in some quarters that Prime had run out of steam after milking its initial 32-bit technology to the limit.

But over the past year, in an understated manner, Prime introduced a series of new machines, extending its line upward to claim a share of the price/performance peak in the supermini industry prior to the announcement of Digital Equipment Corp.'s VAX 8600, code-named Venus, filling out the middle of the line with new boxes and bringing out a generally well-received low-end machine and microprocessor-based workstations. Despite its claim to one of the youngest product lines in the industry, the company has until now not funded an aggressive marketing program, preferring instead to bring its profits back into line.

Gale Aguilar, vice-president of corporate business development and strategy, was brought in from IBM and, like Henson, served more than two decades with the No. 1 computer company. Aguilar said in a recent interview that Prime had to undergo change because other vendors had climbed into the 32-bit market, and Prime needed "to turn this event into a process.

"I don't know that that had anything to do with people," he added. "I'm not sure that [Henson], being here earlier, wouldn't have gone through it, or Fisher, staying longer, . . . wouldn't have gone through the

ANALYSIS

Foundering U.S. PCMs leaving field to IBM, Japanese

By Peter Bartolik
and David Olmos
CW Staff

Yet again, the point is being driven home with brutal finality — climbing into a bed warmed by IBM can be a fatal strategy. The almost sudden collapse of the domestic plug-compatible disk drive industry leaves the huge IBM mainframe community with, effectively, little alternative among vendors.

With Storage Technology Corp. (STC) filing for protection under Chapter 11 of the U.S. Federal Bankruptcy Act just one month after Control Data Corp. announced it was departing the plug-compatible market,-IBM mainframe users are left with the unpalatable alternative of shopping for memory peripherals from either IBM or Japanese competitors.

Yes, Memorex Corp., the Burroughs Corp. subsidiary, has proclaimed it is in the business to stay. But Memorex has experienced the same technological problems that forced CDC out, and the expected introduction of new IBM disk drives next year will add further pressure to Memorex's viability.

Carol Lerner, an analyst with International Data Corp. of Framingham, Mass., was brutally frank about the remaining domestic vendor. "Memorex is just about out of it," she said. "That leaves IBM and the Japanese."

Jonathan Fram, an analyst with Paine Webber, Inc., was not prepared to write the obituary on Memorex. But, he said, "[Memorex] will be a continual drag on [the profits of] Burroughs."

According to Fram, "The Japanese have a willingness to take the long-term view. They are buying up market share at the expense of margins." Hitachi Ltd. and Fujitsu Ltd. stretched to the limit the older ferrite core technology, according to Fram. While the Japanese companies were continuing to increase market share with the older machines, CDC, STC and Memorex all effectively killed sales of older equipment with what turned out to be premature announcements of thin-film head drives.

Now, according to Fram, "Hitachi and

See STC page 147

DG breaks through billion-dollar barrier

WESTBORO, Mass. — Data General Corp. topped the $1 billion annual revenue barrier for the first time in its history, the company said recently.

DG's revenues for fiscal 1984 were $1.1 billion, a 40% increase over $828 million the previous year. Operating income for the year was $102.6 million, or 8.8% of revenues, compared with $36.5 million, or 4.4% of revenues, a year earlier.

Profit for the fourth quarter ended Sept. 29 more than doubled to $29.5 million, or $1.12 a share, compared with $10.7 million, or 43 cents a share, for the corresponding period one year earlier.

The company's profit for the latest quarter was aided by a one-time tax benefit of $12.6 million, or 47 cents a share, resulting from a change in the tax law governing overseas trading.

"This year's performance is largely the result of the most ambitious product development effort in the company's history," said Edson D. De Castro, DG president.

Visicorp to merge with Paladin Software

By Kathleen Burton
CW West Coast Bureau

SAN JOSE, Calif. — Visicorp, the Silicon Valley firm that soared to success on sales of the popular Visicalc financial spreadsheet program, announced recently it will merge with Paladin Software Corp., a one-year-old Santa Clara, Calif., software firm.

The two privately held companies will consummate the agreement with the exchange of an undisclosed amount of stock, said Lydia Barnes, a product line manager at Paladin. Paladin, which was founded in October 1983 under the name Optisoft, is presently developing a business software product, Barnes said.

Visicorp's fortunes dipped last year when the company became involved in internal financial problems and a series of lawsuits with Software Arts, Inc. of Boston, which originally developed Visicalc. Sales of Visicorp's major software programs, Visicalc and Visi On, sagged during that time, and Visicorp eventually relinquished Visicalc copyright, trademark and license to Software Arts in an out-of-court settlement.

Over the past several months, Visicorp has been searching for new products and a new management team to replace several key executives who left the company, said Daniel Fylstra, Visicorp's chairman and chief executive officer. The Paladin merger and the separate sale of a Visicorp subsidiary, Communications Solutions, Inc. of San Jose, Calif., to Control Data Corp. of Minneapolis, will infuse Visicorp with a new management team, new business software products and much-needed cash, he said.

According to the agreement, Paladin's president, Roy Folk, formerly a product manager at Visicorp, will head the new company, which will continue to use the Paladin name. Fylstra will relinquish his duties, but will remain on the board of directors, and Richard Melmon, who became a Visicorp director last spring, will be named chairman of the new firm. Fylstra, who took over Visicorp's operations in July when then-president Terry Opdendyk resigned, would not reveal his plans.

Following the merger, the new company will continue using the name Visi for products that are already on the market, Fylstra said.

JOE M. HENSON

Joe M. Henson spent 28 years with IBM, where he rose to the position of vice-president, industry marketing, in the Data Processing Division. On Dec. 1, 1981, he was named president and chief executive officer of Prime Computer, Inc., which had been leaderless since former president Kenneth G. Fisher suddenly resigned earlier in the year. In an interview with** Computerworld **Senior Editor/Industry Peter Bartolik, Henson spoke of his and the company's transition since 1981 and changes in the industry.

"In IBM, you have a company that has a lot of history and a lot of time in developing its infrastructure, its planning capability, its coordination and integration capability. On the other hand, it is a much larger company, it is slower to make decisions, [it has] many many more levels of management. So there are pluses, and there are minuses. . . . As a matter of fact, I think I'd say the absence of cultural shock was surprising; it was one of the things I was prepared for — that after 28 years at IBM, [it would] be a great big cultural thing, but it wasn't."

"As you would expect under the circumstances, with the prior president having abruptly departed the company and then there being a period of six months when there was no president, there were a lot of transitional, emotional issues. The organization was certainly not stable. . . . So we went through a transitional period where it was necessary for some people to be replaced; some of the individuals who had joined that small start-up company in association with the prior president — as a matter of fact had been recruited from a long-time association with him — weren't interested in working in this company under a new set of management. Some of them made a lot of money and maybe weren't quite as eager to work now; they wanted to enjoy the rewards of their previous efforts. So we had to go through all of that. That was a difficult period, but I think we're through all that."

"So it's one thing to have a corporate strategy, a defined market and product direction you're pursuing, but we have to get the word out to all of the constituencies so that it's manifest and the implementation of it is clear. . . . We have not, until more recent times, invested the money to do that. Well, why haven't we? It's a logical question. Well, why didn't we spend the money? . . . By the time I get here, everybody has a 32-bit minicomputer. So what happens? The gross margins start eroding; we're in the worst economic recession in 40 years; we've got to ramp up the investment in R&D, so we take it from 7.5% to 10.1%; we've got to make that investment of tens of millions of dollars in customer service; we have to expand the sales force; and now, we want to invest money in advertising and sales promotion when we haven't invested in the past. Well, where's all of that going to come from? [How are you going to] maintain your profitability? . . . So where's it going to come from? What we've had to do is reset that economic model. We couldn't do it all at once without impacting the bottom line."

"Sure, I'm threatened by IBM and its size and its muscle. But the [fact remains that] we do have the enormity of the market going for us and the tremendous growth in the departmental level systems — the fastest growing segment of the marketplace, growing much, much faster than the large mainframe marketplace. We're fortunate, on the one hand, to be focused on the very segment of the market that is the fastest growing, that represents a tremendous opportunity for us; it represents a tremendous opportunity for a lot of other people, too, and they can see that."

Prime distinguished by lack of stand-alone micro product

One clear factor distinguishing Prime Computer, Inc. from its traditional competitors in the supermini-computer industry is the lack of a stand-alone microcomputer product, either developed internally or purchased from another company.

According to the company's president, Joe M. Henson, the company realized some factors that perhaps some of its competitors are just now coming to grips with. "I believe if you don't own the technology, and you don't own the sales and service outlets, you really don't control your own destiny," Henson said. "When I looked at the economies of scale, it was obvious to me that [the computer] business was going to be dominated by IBM and the other very, very large-volume players that are already there."

Henson also said, "I don't think a company the size of Prime is going to dominate the personal computer marketplace; that is folly. But we can certainly provide our customers with a capability to integrate workstations more tightly into a Prime network than personal computers acquired from others."

That is not to say the company didn't consider developing such a machine.

Gale Aguilar, vice-president of corporate business development and strategy, said, "We looked at bringing out a so-called [personal computer] some time ago and even put some effort into doing that." He explained that the company wanted to avoid the retail aspects of the micro arena, and concentrate on professional workstations.

"We still fully intend to have microprocessor-based workstations in our product line and, in fact, we do have one of the [Convergent Technologies, Inc.] versions in our office offering right now," Aguilar said.

The company also purchased the rights to the IBM-compatible DOT portable computer produced by Computer Devices, Inc., which has been operating under protection of Chapter 11 of the Federal Bankruptcy Act since last October.

John Maske, vice-president of manufacturing and service, said the company will introduce workstations under a variety of manufacturing scenarios. But, he added, "We're not out of manufacturing entirely; we are going to have something about a year and a half from now that might not be workstation size, but closely related to it, that we will develop and manufacture internally."

PRIME

from page 135

same thing. It is very hard to separate, in a company growing as fast as we've grown, where these events get triggered by changes in the company and the environment and where they get triggered by changes in people. Or maybe they go together; maybe when your environment changes, the better person to manage changes [with it]."

What is clear is that in the three years since Fisher departed the company, many have revised their perception of what kind of shape he left it in. Fisher was not available for comment, but analysts and current Prime executives now say that the company was overdue for internal change when he left.

Aguilar

"The issue at Prime was that too many people perceived the company incorrectly when Fisher left," according to Jay Stevens of Dean Witter Reynolds, Inc. "Under Fisher, [Prime] did not spend enough on R&D. The product line was mature."

Stephen K. Smith, of Paine Webber, Inc. observed, "One thing Henson has done in the first year or two [is] focus on a number of internal problems. . . . There were far too many levels of management; there were problems with equipment reliability. He's put them right, but it's taken a while."

Henson, while stressing that Prime had been extraordinarily successful, recently conceded, "I found a great number of problems that surprised me. And perhaps they shouldn't have, perhaps I should have more accurately anticipated those [problems]."

He cited among the problems the absence of a defined corporate strategy; a weakness in internal operational planning; an undertrained, undermanned and inadequate customer service program; and "at least two levels of organization too many" in the sales organization.

Perhaps most crucial was the level of spending on R&D. When Fisher left, according to company statistics, R&D spending was only 7.5% of revenues; Henson raised that to 8.5% in 1982 and 10.1% in 1983. The company is now committed to the 10% level for the long term.

According to Gerald Kokos, senior manager of investor relations and treasurer of Prime, the shortfall anticipated in revenues in the first and second quarters of 1983 was as much a surprise to the company as to Wall Street analysts. Kokos noted that 1982, a recessionary year for companies like DEC and Data General Corp., was a very strong year for Prime, particularly in the fourth quarter.

The company ramped up R&D spending and sales and support expenses based largely on 1982 results, Kokos added, so "we grew at a healthy 16% rate, but we had an expense base that was built up for 25% growth."

Henson added, "What we had to do was reset the economic model; we couldn't do it all at once without impacting the bottom line." He took pride in the fact that net operating margins were still relatively high during 1983 in comparison to competitors. Much of the 1983 problems resulted from new models introduced by competitors and greater price pressure from that competition. Henson said the company misjudged the pace of the economic recovery and wishes it could have more accurately prepared for the earnings dip. "But I wouldn't have changed the investment process; I think it was crucial," he declared.

Those investments began to pay off last year and this year, with the introduction of the high-end 9950, which, prior to announcement of DEC's latest high-end machine, Prime claimed was the top price/performance machine when evaluated in transactions processed in the multiuser, multifunction environment to which it caters. Since DEC's announcement, Prime spokesmen said the new VAX was not unexpected and does not deter Prime's own development plans. Dean Whitter's Stevens said, "I think next year Prime will bring out a comparable machine to the Venus introduced by DEC."

Prime also took comfort from the fact that DEC's latest VAX model uses emitter-coupled logic (ECL) semiconductors, as opposed to Shottky transistor-transistor logic gate arrays. Prime led the way in this area with an ECL-based 9950 and midrange 9750. The company also touts its Primos operating system that runs on all equipment from the high to low end.

One area the company has stayed out of is the microcomputer arena (see story page 136). Henson and the other officers said they made a conscious decision to stay away from the commodity micro market. But the company was also relatively late bringing out workstation products to work with its superminis. John Maske, vice-president of manufacturing and service, said the company recognizes it is late in that area, "but we don't think the parade has passed us by." Prime has been selling a Convergent Technologies, Inc. workstation under the Prime label and is committed to more.

Although the company in its first decade made its success based on pushing good machines out the door, the focus under Henson is now to identify key market areas where the company can establish itself as a total solutions system provider. A decision made prior to Henson's arrival was to focus on the office automation area, but the company stubbed its toe when software it purchased proved to have problems that effectively killed that strategy.

Now, the goal in the office automation arena is to provide a general-purpose system with word processing and electronic mail capabilities, along with the communications capabilities provided by Prime's Ringnet and Primenet networks. "Our view is that word processing and office automation are generic capabilities of any general purpose computer," Henson said.

Where OA has been discounted as an overall strategy, the company's goals in the area of computer-aided design and manufacturing (CAD/CAM) are stronger than ever. According to Paine Webber's Smith, "With CAD/CAM, [Prime's] done a good job, but it's a very competitive business, and it has to pay close attention."

The other part of Henson's "sharply focused strategy" is to target the distributed data processing market aggressively. Henson said the company protects users' investment in software by maintaining one operating system for the entire product line. But the company is also intent on abiding by industry standards and is working to make Primos coresident with AT&T's Unix, should that evolve into the standard that has been predicted.

Despite the problems of 1983, Prime expects a record earnings year for 1984. Henson said he believes Prime is well positioned for the future.

"We've been embracing new technologies more aggressively. We took a long look and prioritized our development activities to focus more toward high-gross-margin, high-end products than we did toward the low end."

Franklin to free assets in effort to settle with creditors

Legal battles with Apple placed New Jersey-based manufacturer in financial straits

PENNSAUKEN, N.J. — Franklin Computer Corp., the personal computer manufacturer that filed Chapter 11 bankruptcy proceedings in June [CW, July 2], recently said it will liquidate its assets to settle with creditors.

In a reorganization plan filed with U.S. Bankruptcy Court in Philadelphia, Franklin outlined its plans to liquidate its assets, a court spokeswoman said last week. For the past several years, Franklin has been troubled by legal battles with Apple Computer, Inc. involving software copyright infringements. In January, Franklin agreed to pay Apple $2.5 million and promised to cease marketing some of its products.

But the suit put heavy financial strains on the company. In bankruptcy papers filed last summer, Franklin listed assets of $83.9 million and liabilities of $22.8 million. Three of the company's five largest, unsecured creditors are computer companies, including Texas Instruments, Inc., Key Tronic Corp. and Apple. Franklin also owes $4.9 million to its largest secured creditor, National Westminster Bank USA.

This summer the company laid off 160 of 275 employees. Two months ago, the company shifted to a four-day work week.

Marvin Krasny, counsel for the bankrupt company, told *Computerworld* that Franklin will take between six months and a year to liquidate and give the proceeds to its creditors. After that time, he said, it is expected the company will be out of business.

Limited manufacturing will continue in order to convert some of the firm's existing parts into finished inventory, he noted.

Assets and inventory have been written down since the company filed for protection, and current assets are listed at about $15 million, Krasny said.

A question remains as to whether some of the company's intangible assets will be leased or sold.

The reason for the six- to 12-month liquidation period is because the company is "trying to get top dollar," for the assets, Krasny said. "We are not going to sell them off under a hammer at an auction," he said.

Morton David, Franklin chairman and chief executive officer, also announced that former Vice-President Michael Strange was appointed president of the company, succeeding Joel Shusterman, a Franklin founder who returned to the company after the May resignation of R. Barry Borden.

Sperry forms AI center, inks joint pacts

By Charles Babcock
CW New York Bureau

NEW YORK — Sperry Corp. has consolidated its artificial intelligence and expert systems activity into a Knowledge Systems Center in Minneapolis and has signed letters of intent with two other companies for joint AI efforts.

Both moves are needed for Sperry "to move artificial intelligence technology out of the laboratories and into commercially viable applications," Sperry's Executive Vice-President Joseph J. Kroger said at the company's advanced technology symposium recently held in New York.

New York-based Sperry plans to team up with Texas Instruments, Inc. of Dallas to produce specialized processors for Lisp, AT&T's Unix and new man-machine interfaces. It will also offer TI's Explorer and other artificial-intelligence-based products, Kroger said.

Explorer, announced earlier this year, is an AI development environment supplied with separate communicating processor boards designed to support the Unix operating system and symbolic processing.

Sperry also plans to distribute jointly the Knowledge Engineering Environment software system produced by Intellicorp of Menlo Park, Calif., and use the system itself in developing expert-systems-based products, Kroger added.

Varied operational problems

Sperry programs will address operational problems in manufacturing, financial services and energy industries as well as federal and local government applications, he said.

The $20 million Knowledge Systems Center will combine Sperry's four electronics-based business units: Information Systems Group in Blue Bell, Pa.; Defense Products Group in Eagan, Minn.; Systems Management Group in Great Neck, N.Y.; and Aerospace and Marine Group in Phoenix.

The center will be under the direction of Larry L. Walker, former director of interconnect and marketing strategies.

The new IBM PC AT/370

Introducing connections for

With the new IBM Personal Computer AT/370, you can work with hundreds of VM programs and with mainframe data right at your desk. And only IBM offers a personal computer with VM capabilities.

Now that's a Smart Desk with very powerful connections.

The PC AT/370 lets you interact with your host computer, or operate stand-alone with the power of 64-bit System/370 architecture. It also gives you the ability to address up to eight megabytes of virtual memory.

There is faster response time because you don't have to wait for the host. And there is greater data privacy because programmers need not have access to host data.

You also get 20 or 40 megabytes of storage plus the capability of running thousands of existing IBM PC programs. This makes the PC AT/370 not only a powerful connection but also a very versatile one.

One further point: If you already have a PC AT or XT, it can easily be upgraded to a PC AT/370 or XT/370 respectively. Ask your IBM marketing representative for the details.

And if you want to receive literature on how the PC AT/370 can turn your desk into a Smart Desk, call 1 800 IBM-2468, Ext. 90, or send in this coupon.

The Smart Desk from IBM

VAX 8600 predicted to fuel DEC's revenue rebound

By David Olsen
CW Staff

BOSTON — One day after the long-awaited announcement of Digital Equipment Corp's. high-end superminicomputer, the VAX 8600, DEC President Kenneth H. Olsen asserted that his company has put its problems behind it and is gathering momentum.

"A year ago, we had trouble explaining what we were going to do," Olsen told shareholders, analysts and other attendees at DEC's Nov. 1 annual meeting here. He was referring to last year's meeting during which the company announced a staggering 73% drop in first-quarter earnings to baffled shareholders.

"We have forgotten about that," Olsen said of the first quarter of 1983. "The basic problems we generated for that first quarter are not with us [any longer]."

In contrast to a year ago, Olsen could enjoy some good news. The VAX 8600 announcement, he said, received an "enthusiastic reception" from analysts and the press. He could also bask in the company's recent financial results, which showed first-quarter profits and revenue up sharply from a year earlier.

Olsen noted, however, that the Maynard, Mass., company's first-quarter profits were boosted by a nonrecurring tax benefit from a tax law change governing overseas trading. "We will not see this again next year," he said, but added that the company's performance "will always be measured against" the previous year's results, including the tax credit.

Commenting on whether the powerful 8600 is an effort to go after a piece of IBM's market, Olsen said the answer is "Obviously, no. IBM is eight times bigger than we are. It is mathematically impossible for us to take over IBM," Olsen said. The company's objective, he said, is to prevent IBM from making inroads into DEC's customer base. "IBM has no reason to worry about us. We have a lot of reason to worry about them."

However, Olsen's statements regarding IBM seemed at odds with remarks he made a day earlier at the 8600 unveiling. Asked then if the No. 2 computer maker was planning to compete directly with IBM's product line, Olsen replied, "What do you think we have been doing for the past two years?"

Discussing the company's strategy, Olsen said DEC is committed to the concept of clustering VAXs to a common data base as a way of achieving a single, high-performance system. "We believe that clustering gives all the benefits of multiprocessing and more," he said.

Retail market bomb

Olsen conceded that the company's personal computers "bombed in the retail market." He attributed that lack of success to retail customers not knowing for what purposes they wanted to use personal computers. He claimed DEC's personal computers have sold well to "our kind of customers."

Olsen asserted that DEC's personal computer line is not dead yet. "We're just starting," he said. "The personal computer is a key part of our strategy."

Olsen defended the company's marketing of its personal computers by downplaying the importance of advertising. "Marketing . . . always means, first of all, defining the product, defining customers' needs and then matching them," he said. If a product meets those criteria, he added, "with or without Charlie Chaplin or space things, it will sell."

"We didn't get to $5.6 billion [in annual revenue] without a little scheming about how we sell," Olsen said. "And if you can sell without looking too obvious, it's better."

Olsen was also asked when he expects the company's operating profit margins to return to their historic double-digit levels. In the fiscal year ended June 30, DEC's operating margin was 6%.

"Our historic attitude has been never to make promises," Olsen said. He said he hopes DEC's new products will help restore the company's past profit levels, but he noted that a "pending economic slowdown" in the U.S. does not bode well for a speedy change in the situation.

© IBM Corporation

DEC officer leaves position

MAYNARD, Mass. — Alfred M. Bertocchi, chief financial officer of Digital Equipment Corp. since 1971, has stepped down from that position, according to an announcement made by company President Kenneth Olsen Nov. 1.

Olsen said Bertocchi had asked to reduce his responsibilities at the company. However, Bertocchi will continue to work for DEC on a consulting basis.

While Bertocchi served in his position, DEC's annual revenues grew from $140 million to $5.6 billion. "[Bertocchi] is one who always had very good sound judgment and wisdom on financial matters," Olsen said.

AEA lauds Wang; cites arts, educational contributions

By David Gimes
CW Staff

BOSTON — An Wang, who 34 years ago founded a small electronics company that he proceeded to build into a world leader in office automation, was awarded the American Electronics Association's (AEA) 1984 Medal of Achievement last month.

Wang

Wang, chairman of the board and chief executive officer of Wang Laboratories, Inc. in Lowell, Mass., accepted the award at the AEA's annual meeting here.

"I accept this honor on behalf of my colleagues at Wang Laboratories who have helped me in my work. This award is, indeed, a tribute to their faith in progress through technology," Wang said in accepting the award.

The medal is the AEA's highest award, presented annually for significant contributions to the advancement of electronics. The medal recognizes overall accomplishment rather than specific inventions or contributions. Other considerations include service to the community, humanitarian organizations and educational institutions.

Last year's recipient of the medal was John G. Linvill of Stanford University, Stanford, Calif.

Dean O. Morton, AEA chairman and chief operating officer of Hewlett-Packard Co., said Wang was being recognized not only for his technical achievements, but also for "his contributions of both time and financial aid to educational institutions, the community and the arts. Dr. Wang has taken his responsibilities beyond the successful management of his company and into the community."

Wang stressed the need for the U.S. to foster a forward-looking, aggressive educational policy in order to maintain its technological supremacy. "As the leaders of an industry whose continued success depends upon education, we have a vital stake in ensuring that our educational institutions keep pace with high technology's ever-increasing need for highly educated individuals," he said.

At the same time, Wang noted, "We should remember that our fervor for the new technology must be tempered with an abiding respect for our humanistic values and traditions. Accordingly, we must remember the importance of our great cultural institutions and their profound contributions to the quality of life within our communities."

He urged the roomful of top computer industry executives to support cultural activities because "without our commitment, they cannot sustain the artistic and cultural endeavors which bring grace and dignity to our lives."

A graduate of Chiao Tung University in Shanghai and Harvard University in Cambridge, Mass., Wang began his computer manufacturing company in Boston's South End in 1951. In the early 1950s, he invented the magnetic core memory, which for more than two decades was a basic component of the computer.

Wang Laboratories introduced a desktop computer called Loci in 1964. A forerunner of the company's electronic desk calculator, it had a keyboard resembling that of an adding machine, but offered the user the unique feature of generating logarithms with a single keystroke.

In fiscal 1984, Wang Laboratories reported net income of $210 million on revenues of $2.1 billion.

Intel licenses Fujitsu to produce, market 16-bit microprocessors

SANTA CLARA, Calif., — Intel Corp. last week announced it will grant Fujitsu Ltd. a license to manufacture and market Intel's 80186 and 80286 16-bit microprocessors and the 8051 microcontroller.

According to Intel, the agreement includes the 80188, an 8-bit bus version of the 80186, and the 82284 clock generator and 82288 bus controller support devices for the 80286.

The agreement expands the 1981 technology exchange pact between the two companies, in which Fujitsu was granted a second source license for Intel's 8086 and 8088 microprocessors, the 8089 coprocessor and support devices. The current agreement reportedly provides for the transfer of mask-set information from Intel to Fujitsu. Fujitsu said it plans to have its sample available in mid-1985, with Intel's 8051 available as early as January.

Michael Gumport, an analyst with Paine Webber, Inc., said the Intel move is in keeping with Intel's plans to provide second sourcing in Europe, Japan and the U.S.

Matami Yasufuku, Fujitsu executive director, said the agreement enables Fujitsu to give full support to expansion from a 4-bit to an 8- or 16-bit microprocessor.

WE'RE OUT
THE FEDERA
OF BIG PA

Over the past eleven years, people have come to think of Federal Express as the best way to send important letters and small packages.

That's really too bad.

Because while almost everyone knows Federal Express is great for small things, almost no one knows we're also great for big things.

WE'RE OUT TO CHANGE ALL THAT.

Most people immediately assume that getting Federal Express service for a big package or shipment will cost big money.

But just take a look at the example on the left.

Sending a 150-pound package from New York to Los Angeles actually costs a lot less with Federal Express than with Emery or Burlington Northern.

This isn't some trick example. To most places, a package that weighs over 100 pounds costs less by Federal Express than with many major air freight companies. Even less than many major freight forwarders.

It also pays to use Federal for your bulk shipments. With our new Hundredweight pricing, instead of charging you by the weight of each individual package in your shipment, we'll charge you based on the total weight of the shipment.

So if you're sending, say, a 12-piece shipment weighing 300 pounds from New York to Los Angeles, it will only cost $465.00. The same shipment would cost $748.80 by Emery. Even Burlington Northern would get $488.25.

Signetics cuts defense firm shipments

By Kathleen Burton
CW West Coast Bureau

SUNNYVALE, Calif. — Semiconductor manufacturer Signetics Corp. stopped shipping electronic chips to 25 of its defense contractors early last month, after a voluntary internal audit in mid-September revealed possible testing irregularities in 1,200 types of chips destined for military users.

Signetics, one of the largest military chip suppliers, which sells about $70 million in chips annually to military contractors, said it voluntarily notified defense contractors of the potential irregularities and said the discrepancies may involve chips shipped since 1981.

Signetics spokesman Ronald Deutsch said the company did not test its semiconductors according to the electrical specifications originally drawn up by its defense contractors. He noted that in most cases, the contractors had verbally approved waivers in the electrical testing requirements for the chips, but had failed to confirm the changes in writing. Signetics' internal audit was prompted by an incident last September at Texas Instruments, Inc., when IBM discovered that TI had not fully tested its military chips, he said.

According to a semiconductor industry analyst who asked not to be identified, the incidents at TI and Signetics underscore a long-standing practice among Department of Defense (DOD) contractors to use internal testing requirements for chips rather than DOD-approved standards. He said contractors generally create their own testing requirements, called source control drawings, for chips that do not already have formal military testing standards because it sometimes takes as much as a year for DOD engineers to devise formal testing protocols for new chips.

A spokesman for IBM, a major Signetics customer and defense contractor, said it has stopped shipping military equipment using Signetics chips until the irregularities are more clearly identified.

Prime acquires Japan-based distributor

NATICK, Mass. — Prime Computer, Inc. last month announced it has acquired its exclusive Japanese distributor to sell and service Prime systems in Japan.

The company purchased Prime Computer Japan, Inc. from Marc Analysis Research Corp. of Palo Alto, Calif., in a cash transaction. A spokeswoman for the company [redacted]

Prime said the new wholly owned subsidiary, to be headquartered in Tokyo, will focus on marketing its computer-aided design and manufacturing systems and its Prime Information relational data base management programs, both of which have been modified for the Japanese language.

The company also announced the creation of its sixth overseas regional office, the North Pacific Zone Office, in Tokyo. The office will oversee Prime's Japanese subsidiary and its distributorships in Taiwan and South [redacted]

[redacted] aging director of the subsidiary and general manager of the regional office. Stratton formerly was national marketing manager for Prime Computer of Australia Ltd.

TO BECOME
AL EXPRESS
ACKAGES.

And, if you use our economical 1 to 2 day Standard Air℠ service, or qualify for a volume discount, you'll save even more.

WE'RE OUT TO DO FOR BIG PACKAGES WHAT WE'VE DONE FOR SMALL PACKAGES.

Don't let our low prices scare you away. You'll still be getting the same service that's made us the biggest name in small packages.

The same 10:30 AM* delivery. The same Saturday service. And the same door-to-door convenience.

You'll get our unique network that includes the most advanced tracking system in the business. So you'll never have to worry about your package getting lost.

Best of all, with our new 150-pound limit, as long as each package doesn't weigh more than 150 pounds, almost no shipment is too big to send Federal.

WE'RE OUT TO GET YOUR PACKAGE TO MORE PLACES THAN ANYONE ELSE.

Since we're the largest air express company in the United States, it's not surprising that we go to a lot of places.

More places overnight, in fact, than any other delivery company.

So next time you have to get something to Walla Walla or Spurger overnight, you won't have to waste a day trying to figure out which company can get it there.

And you won't pay extra charges to get your package or shipment to some place other companies consider off the beaten track.

WE'RE OUT OF SPACE.

For more information about why you should be using Federal Express for your big packages and shipments, call 1-800-238-5355.

Because if you think Federal Express is only good for small packages, you're making a very big mistake.

*Monday through Friday as designated in the Federal Express Service Guide. [illegible] ©1984 Federal Express Corporation.

Motorola/Four-Phase introduces The 6000 Series–a new milestone.

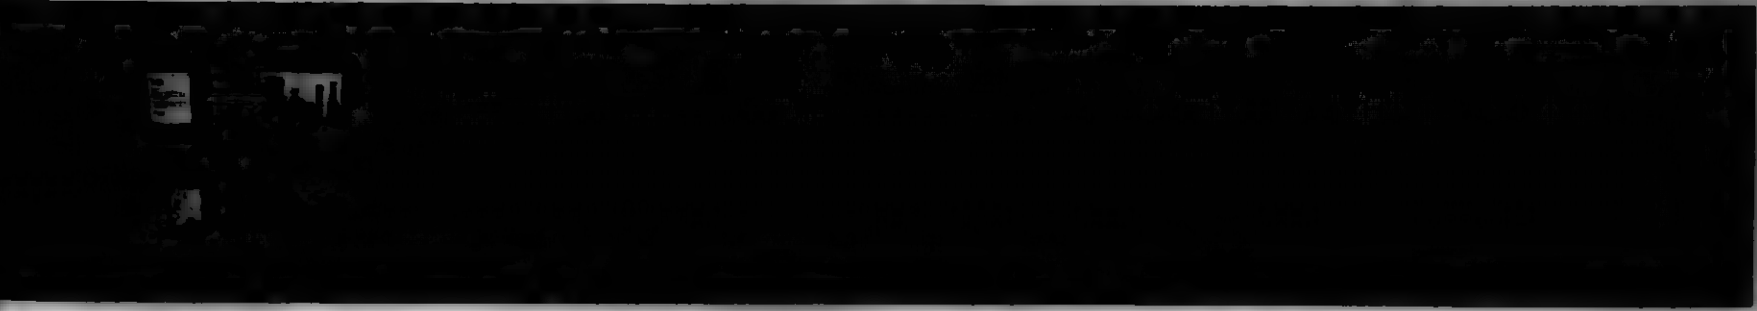
A milestone for new standards in office information systems from the company that started it all.

From the moment Four-Phase introduced the world's first all-LSI computer in 1970, we have consistently presented the industry with innovative hardware and software products to help make business more profitable and productive.

Today, as a member of the Motorola Information Systems Group, Four-Phase once again unveils another milestone in information processing—the new 6000 family of office information systems. Compact, powerful processing units and flexible, capable software have been fused together into a family of systems that deliver maximum results today, with substantial expansion capabilities for tomorrow.

Technology for the real world.

Motorola/Four-Phase systems are tough enough and smart enough to deal with the real world—where speed, power, and reliability in a multi-user environment are prime considerations. The new 6000 systems feature the high-performance 32-bit Motorola 68010 CPU and an operating system derived from UNIX* System V under license from AT&T. We created



integrated system software that combines these two industry standards into a powerful, multi-user, multi-tasking environment that can stand up to practically any application.

There are two systems in the 6000 family. The 6300 supports 1-8 users, making it perfect for the smaller user or a remote office. The 6600 is a high-performance system designed to support up to 128 users. Both systems offer complete and integrated solutions—whether they're working in an operations-oriented environment where efficiency and precision are needed, or a results-oriented environment where flexibility and quality are key.

Service and support to match our technology.

At Motorola/Four-Phase, our commitment to you goes beyond providing quality, high-performance hardware and software. Support is just as important. Our award-winning Customer Support Operation is staffed with over 1,400 customer support specialists in over 175 cities across the nation. One phone call to our Operations Center will ensure prompt response from the nearest available specialist. And you can call the Center 24 hours a day, 365 days a year.

If you're a DP/MIS manager or OEM, find out what the latest milestone in office systems can mean to you. Contact Motorola/Four-Phase today at 1-800-528-6050, ext. 1599. In Arizona, call 1-800-352-0458, ext. 1599. Or write us at 10700 North De Anza Blvd., M/S 52-3B1, Dept. S., Cupertino, CA 95014.

NICKELS AND DIMES

Computer Task Group, Inc. reported revenues for the third quarter ended Sept. 30 of $21.8 million, compared with $13.5 million in the comparable period one year ago. Profits were $538,000, or 26 cents per share, compared with $406,000, or 21 cents per share, in the same period one year earlier.

■

Cipher Data Products, Inc. reported profits for the first quarter ended Sept. 30 of $3.7 million, or 28 cents per share, compared with $2.2 million, or 17 cents per share, in the corresponding quarter last year. Revenues were $38.8 million, compared with $24.1 million in the same period a year ago.

■

Integrated Device Technology, Inc. announced that profits for the second quarter ended Sept. 30 rose to $1.7 million, or 12 cents per share, compared with a loss of $556,000, or 6 cents per share, in the comparable period one year ago. Revenues were $9.6 million, compared with $2.6 million in the same quarter a year ago.

■

GTE Corp. reported profits for the third quarter of $277 million, or $1.36 per share, compared with $236 million, or $1.22 per share, in the same period one year ago. Revenues were $3.6 billion, compared with $3.3 billion a year ago.

■

Applied Data Research, Inc. reported revenues for the three months ended Sept. 30 of $33.6 million, compared with $24.8 million in the same quarter one year earlier. Profits were $2.5 million, or 47 cents per share, compared with $3.1 million, or 58 cents per share, in the comparable period last year.

■

Nashua Corp. announced profits for the third quarter ended Sept. 28 of $3.9 million, or 82 cents per share, compared with $2.5 million, or 53 cents per share, for the same period a year ago. Revenues were $144.8 million, compared with $137 million, for the year-earlier period.

■

Printronix, Inc. reported profits for the second quarter of $2.8 million, or 61 cents per share, compared with $1.6 million, or 35 cents per share, in the same quarter last year. Revenues were $37.4 million, compared with $26.9 million for the comparable quarter one year earlier.

■

Computer & Communications Technology Corp. announced revenues for the third quarter ended Sept. 29 of $31.6 million, compared with $22.8 million last year. Profits were $3.2 million, or 41 cents per share, compared with $1.5 million, or 20 cents per share, in the same period last year.

■

Communications Satellite Corp. announced profits for the third quarter ended Sept. 30 of $12.8 million, or 71 cents per share, compared with $12.7 million, or 71 cents per share, reported for the same period one year earlier. Revenues were $109.9 million, a decrease of $4.4 million from the third quarter of 1983.

■

Mentor Graphics Corp. reported revenues of $24.2 million for the third quarter ended Sept. 30, compared with $7.9 million for the same period a year ago. Profits were $2.3 million, or 17 cents per share, compared with $419,000, or 5 cents per share, for the same quarter last year.

NO OTHER LETTER-QUALITY PRINTER CAN TOUCH OUR NEW SPINWRITER FOR SPEED AND EASE-OF-USE.

Introducing the Spinwriter 8850.
Our newest, and fastest, Spinwriter® printer operates at over 550 words-per-minute. And is extraordinarily easy to operate.

For one thing the Spinwriter 8850 takes care of basic settings such as pitch and forms length automatically. Of course you can also change either one at the touch of a button. It also has a unique control panel. With large, legible alphanumeric LED's to indicate the specific operating status. And make it simple for even an unfamiliar operator to use.

THE 8850 JOINS THE HIGHLY-RELIABLE SPINWRITER LINE

UNIQUE LED DISPLAY TELLS USER EVERYTHING FROM THE FACT THAT PAPER IS OUT

TO THE FACT THE COVER IS OPEN

And, of course, the 8850 has all the features, quality and reliability that make a Spinwriter a Spinwriter.

The first choice of IBM PC users.
The Spinwriter printer was the first totally plug compatible letter-quality printer available for the IBM® PC. It's still one of the few that works with all IBM PC software, as well as all other popular packages. You'll notice even its looks are compatible.

Spinwriter printers also give you capabilities you won't find on other printers. Like a selection of 80 different print styles.

And, nine easily installed forms handling options that can accelerate your printed output even more. Spinwriter printers also have an enviable record for reliability.

In fact, several years without a failure is not unusual. No wonder there are more Spinwriter printers hooked up to IBM PC's than any other letter-quality printer.

CHANGE FORMS LENGTH AT THE PRESS OF A BUTTON.

How to get up to speed.
For more information on the Spinwriter 8850 or our two companion models, just call NEC Information Systems at: 1-800-343-4419; in Massachusetts call (617)264-8635. Also available at: Entre, 1-800-HI ENTRE; Sears Business System Centers, 1-800-228-2200; and Computerland stores, (In California) 1-800-321-1101; (Outside California) 1-800-423-3008. Find out why more and more IBM PC users are saying, "NEC and me."

The Enterprise Files from International Data Corporation give you the detailed sales information you need to stay ahead in today's competitive computer market.

Now you can locate prospective clients, fine-tune your promotional campaigns, and track competing companies. And you'll do it all quickly, easily, and accurately.

When you subscribe to the Enterprise Files you'll get up-to-date facts on more than 13,000 companies and the 35,000 computer-related products & services they offer. Many leading organizations have already made the Enterprise Files their number one source of information. Here are four reasons why...

1) Comprehensive listings

The Enterprise Files are divided into two general categories, Vendor Files and Product Files.

Each vendor profile includes: company and division names, parent company, address and telephone number, type of company, number of employees, years in business, target industries, target applications, key corporate executives, geographic coverage, and product/service offerings.

Every product profile includes: price, model number, date of introduction, the number of installations, channels of distribution, and market status. Also, each product or service is researched individually, with up to 25 product-specific characteristics identified.

You'll get everything you need to compare product specs and contact vendors.

2) Custom packaging

No matter which companies and products interest your organization, you can get the information you need, the way you need it. Because the Enterprise Files are available in three ways. You can choose the complete file, any of 26 standard subfiles, or custom packaging. So you'll pay only for what you need.

3) Easy to use

Once you've determined what kind of information you need, you can choose between three convenient ways of receiving your information. Magnetic tape for permanent storage, pressure sensitive labels for direct mail promotions, and hard copy for a handy resource tool.

4) Accurate listings

The information in the Enterprise Files is gathered and updated daily by International Data Corporation. IDC has been the leading market research firm covering the information processing industry for 20 years. And IDC is the only firm solely dedicated to studying this market. So you can rely on the information in the listings.

Send for your FREE brochure today

Can you afford to be without this kind of detailed information about your industry? Put the Enterprise Files to work for you. Call Mike Hovagimian today to get your FREE copy of our brochure. It describes what the Enterprise Files are, what your custom packaging options are, and includes a rate sheet. Call right now. You can reach Mike at (617) 872-8200.

Or, if you prefer, fill out the coupon below and return it today.

INTERNATIONAL DATA CORPORATION

DIMES

from page 144

Perfect Data Corp. announced revenues for the quarter ended Sept. 30 were $1.7 million, compared with $1.2 million in the same period a year earlier.

■

Altos Computer Systems, Inc. reported profits for the first quarter ended Sept. 29 of $3.7 million, or 25 cents per share, compared with $1.1 million, or 8 cents per share for the same quarter a year ago. Revenues were $33.3 million, compared with $18.1 million in the corresponding quarter last year.

■

Micro D, Inc. announced that it will take a one-time $2.5 million charge against earnings in the fourth quarter ending Oct. 31, representing a write-down of inventory and accounts receivable.

■

The write-down will result in an estimated pretax loss in the fourth quarter of approximately $1.6 million. This represents an estimated after-tax loss of approximately $850,000, or 13 cents per share.

■

Computer Automation, Inc. reported a net loss of $589,000, or 29 cents per share, compared with a net loss of $2.8 million, or $1.40 per share, in the same quarter one year earlier. Revenues were $14.2 million, compared with $12.1 million in the same period last year.

■

Miniscribe Corp. reported a third-quarter net loss of $2,5 million, or 13 cents per share, compared with 1.4 million, or 5 cents per share, in the same period one year ago. Revenues were $26.1 million, compared with $21.7 million in the same quarter last year.

■

Corporate Data Sciences, Inc. announced a net loss for the quarter ended Aug. 31 of $251,203, or 5 cents per share, compared with $79,616, or 6 cents per share, in the same period one year earlier.

■

Zenith Electronics Corp. reported profits for the third quarter ended Sept. 29 of $21.9 million, or 99 cents per share. Profits include a domestic international sales corporation tax adjustment for $10.4 million, or 47 cents per share. Third-quarter revenues were $436 million, compared with $341 million for the same period last year.

■

U.S. Design Corp. reported revenues for the three months ended Sept. 30 of $1.3 million vs. $1 million in the same period one year ago. The company's net loss in the first quarter was $469,006, compared with a net loss of $473,000 incurred in the same quarter one year earlier.

■

Hogan Systems, Inc. reported revenues for the second fiscal quarter of $11.3 million, compared with $8.5 million for the same period one year ago. Profits were $1 million, or 7 cents per share, compared with $1.8 million, or 14 cents per share, in the comparable quarter one year earlier.

■

Integrated Software Systems Corp. announced revenues for the third quarter ended Sept. 30 of $8.8 million, an increase of 40% from last year's revenues of $6.3 million. Profits were $1.1 million, or 22 cents per share, compared with $955,000, or 18 cents per share, in the same quarter one year ago.

■

Iomega Corp. reported revenues for the third quarter ended Sept. 30 of $1.56 million, compared with $3.2 million in the same period one year ago. Profits were $1.7 million, or 13 cents per share, compared with a loss of $2.4 million, or 21 cents per share, in the corresponding period one year earlier.

■

Lee Data Corp. announced revenues for its second quarter ended Sept. 30 of $22.2 million, compared with $22.6 million in the same quarter one year ago. Profits were $1.6 million, or 12 cents per share, compared with $4.2 million, or 30 cents per share, in the second quarter of the previous year.

■

Dataproducts Corp. reported revenues of $114.1 million for the second quarter ended Sept. 29, compared with $91.4 million in the same period one year earlier. Profits were $5.4 million, or 26 cents per share, compared with $5.1 million, or 25 cents per share, for the same quarter one year ago.

■

Intergraph Corp. reported revenues for the third quarter ended Sept. 30 of $105.4 million, compared with $67.2 million in the same period one year earlier. Profits were $17.3 million, or 67 cents per share, compared with $7.7 million, or 30 cents per share, for the comparable period one year ago.

■

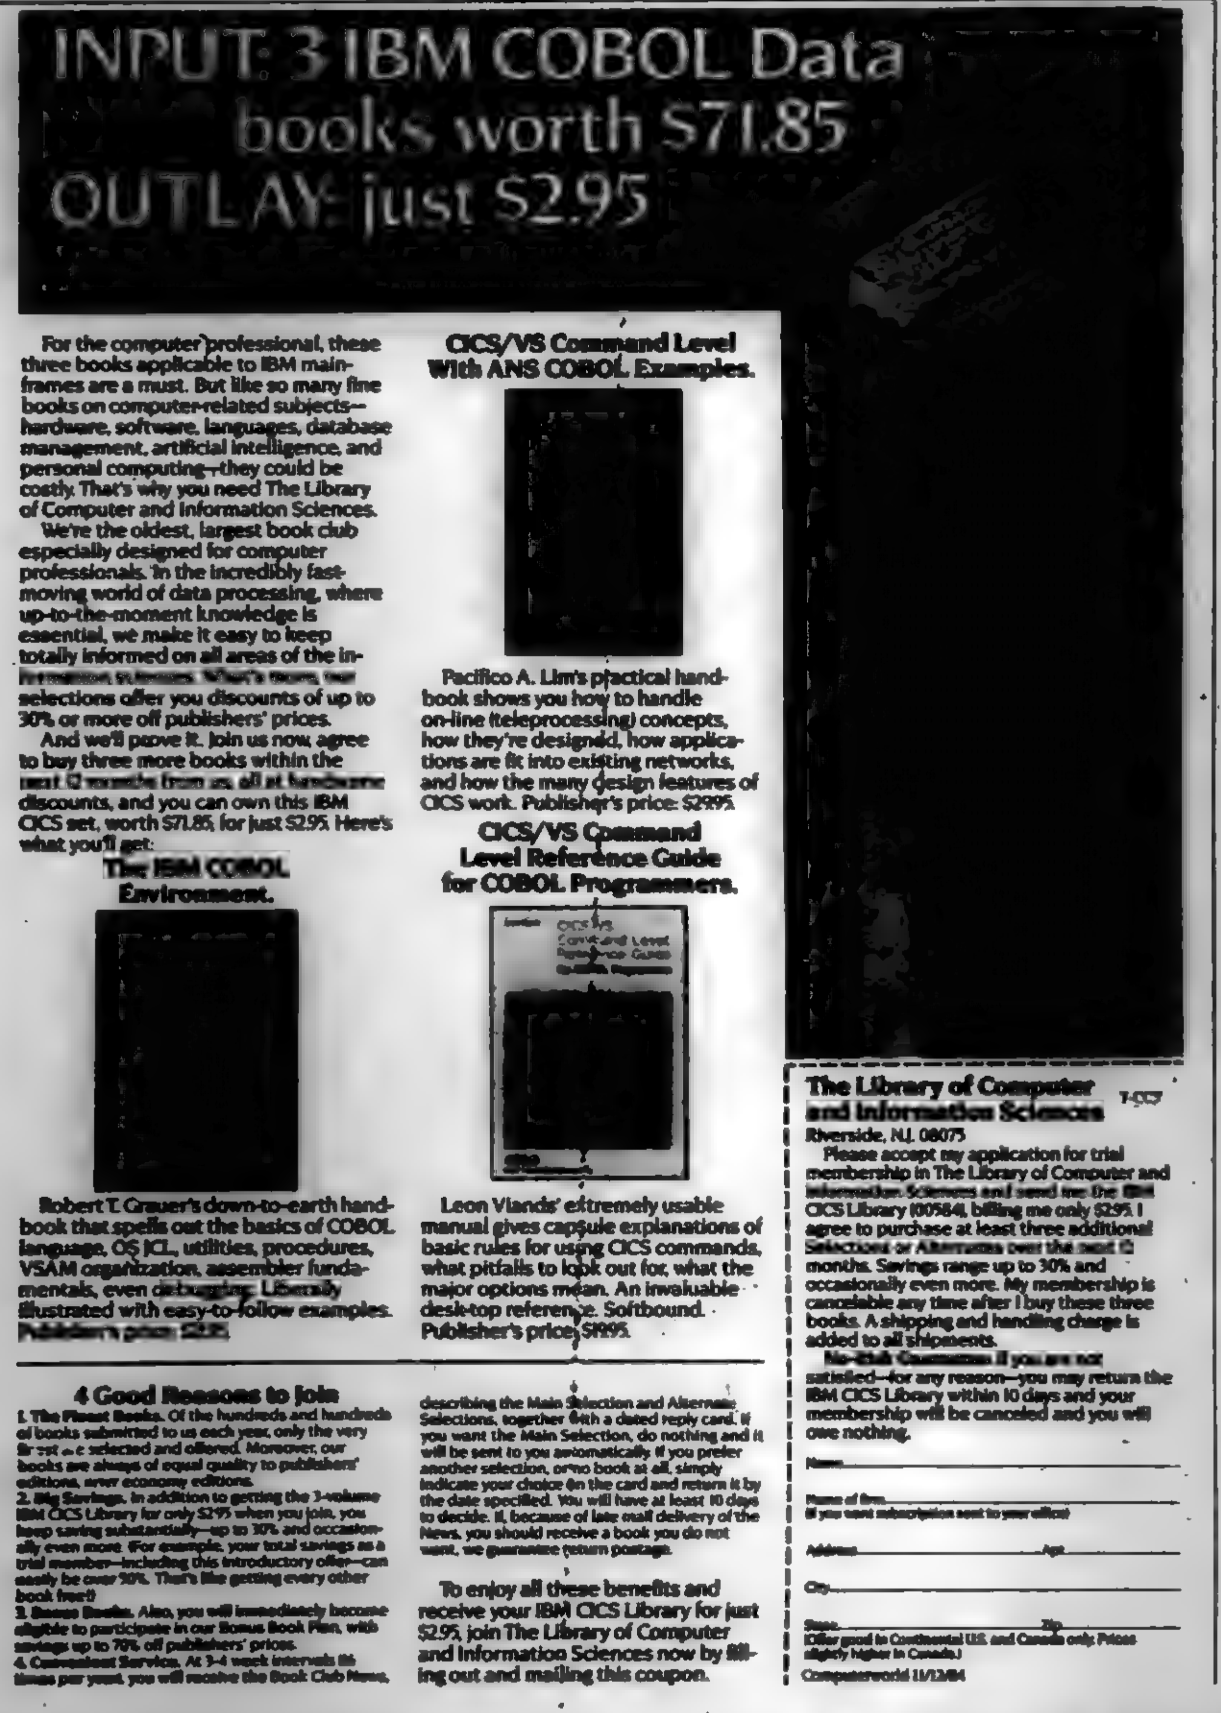
Mentor Graphics Corp. announced revenues for the third quarter ended Sept. 30 of $24.2 million, compared with $7.9 million in the same period a year ago. Profits were $2.3 million, or 17 cents per share, compared with $419,000, or 5 cents per share, for the same quarter one year earlier.

■

Evans & Sutherland Computer Corp. reported revenues for the third quarter of $17.6 million, compared with $16.7 million in the same quarter last year. Profits were $1.7 million, or 19 cents per share, compared with $2.9 million, or 33 cents per share, in the comparable period one year earlier.

■

Seagate Technology reported revenues of $50.6 million for its first fiscal quarter ended Sept. 30, compared with $50.6 million for the comparable year-ago quarter. Profits were $577,000, or 1 cent per share, com-



INPUT: 3 IBM COBOL Data books worth $71.85
OUTLAY: just $2.95

For the computer professional, these three books applicable to IBM mainframes are a must. But like so many fine books on computer-related subjects—hardware, software, languages, database management, artificial intelligence, and personal computing—they could be costly. That's why you need The Library of Computer and Information Sciences.

We're the oldest, largest book club especially designed for computer professionals. In the incredibly fast-moving world of data processing, where up-to-the-moment knowledge is essential, we make it easy to keep totally informed on all areas of the information sciences. What's more, our selections offer you discounts of up to 30% or more off publishers' prices.

And we'll prove it. Join us now, agree to buy three more books within the next 12 months from us, all at handsome discounts, and you can own this IBM CICS set, worth $71.85, for just $2.95. Here's what you'll get:

The IBM COBOL Environment.

Robert T. Grauer's down-to-earth handbook that spells out the basics of COBOL language, OS JCL, utilities, procedures, VSAM organization, assembler fundamentals, even debugging. Liberally illustrated with easy-to-follow examples. Publisher's price: $[illegible]

CICS/VS Command Level With ANS COBOL Examples.

Pacifico A. Lim's practical handbook shows you how to handle on-line (teleprocessing) concepts, how they're designed, how applications are fit into existing networks, and how the many design features of CICS work. Publisher's price: $29.95.

CICS/VS Command Level Reference Guide for COBOL Programmers.

Leon Viands' extremely usable manual gives capsule explanations of basic rules for using CICS commands, what pitfalls to look out for, what the major options mean. An invaluable desk-top reference. Softbound. Publisher's price: $19.95.

4 Good Reasons to Join

1. **The Finest Books.** Of the hundreds and hundreds of books submitted to us each year, only the very finest are selected and offered. Moreover, our books are always of equal quality to publishers' editions, never economy editions.
2. **Big Savings.** In addition to getting the 3-volume IBM CICS Library for only $2.95 when you join, you keep saving substantially—up to 30% and occasionally even more. (For example, your total savings as a trial member—including this introductory offer—can easily be over 50%. That's like getting every other book free!)
3. **Bonus Books.** Also, you will immediately become eligible to participate in our Bonus Book Plan, with savings up to 70% off publishers' prices.
4. **Convenient Service.** At 3-4 week intervals (16 times per year), you will receive the Book Club News, describing the Main Selection and Alternate Selections, together with a dated reply card. If you want the Main Selection, do nothing and it will be sent to you automatically. If you prefer another selection, or no book at all, simply indicate your choice on the card and return it by the date specified. You will have at least 10 days to decide. If, because of late mail delivery of the News, you should receive a book you do not want, we guarantee return postage.

To enjoy all these benefits and receive your IBM CICS Library for just $2.95, join The Library of Computer and Information Sciences now by filling out and mailing this coupon.

The Library of Computer and Information Sciences 7-CC7
Riverside, N.J. 08075

Please accept my application for trial membership in The Library of Computer and Information Sciences and send me the IBM CICS Library (00584), billing me only $2.95. I agree to purchase at least three additional Selections or Alternates over the next 12 months. Savings range up to 30% and occasionally even more. My membership is cancelable any time after I buy these three books. A shipping and handling charge is added to all shipments.

No-Risk Guarantee: If you are not satisfied—for any reason—you may return the IBM CICS Library within 10 days and your membership will be canceled and you will owe nothing.

pared with $4.4 million, or 10 cents per share, for the year-earlier period.

■

Computer Associates International, Inc. announced revenues for the second quarter ended Sept. 30 of $31 million, a 70% increase compared with $18.2 million for the year-earlier period. Profits were $2.2 million, or 21 cents per share, compared with $1.5 million, or 15 cents per share, for the same period a year ago.

■

AGS Computers, Inc. announced revenues for the third quarter ended Sept. 30 of $56.1 million, compared with $38.7 million in the comparable period a year earlier. Profits were $1.7 million, or 34 cents per share, compared with $1.5 million, or 34 cents per share, in the same quarter last year.

■

Ramtek Corp. reported revenues for the first quarter ended Sept. 30 were $10.7 million, compared with $9.4 million for the corresponding period last year. Profits were $92,000, or 3 cents per share, compared with a loss of $715,000, or 21 cents per share, in the same quarter one year ago.

■

Daisy Systems Corp. announced that revenues for the fourth quarter ended Sept. 30 were $21.8 million, compared with $7.3 million in the corresponding period one year earlier. Profits were $3.3 million, or 22 cents per share, compared with $1.7 million, or 11 cents per share, in the same period one year ago.

■

Quantum Corp. reported revenues for the second quarter ended Sept. 29 were $30 million, compared with $15.1 million for the same quarter a year earlier. Profits were $4.6 million, or 49 cents per share, compared with $2.4 million, or 26 cents per share, in the corresponding period a year ago.

■

Compugraphic Corp. reported revenues for the third quarter ended Sept. 29 of $101.3 million, compared with $81 million in the comparable quarter one year earlier. Profits were $6.5 million, or 79 cents per share, compared with $4.7 million, or 57 cents per share, in the previous year's quarter.

■

Informatics General Corp. announced revenues for the third quarter of $53.8 million, compared with $45.7 million in the same period one year earlier. Profits were $1 million, or 19 cents per share, compared with $2.3 million, or 42 cents per share, for the corresponding quarter a year ago.

■

Compaq Computer Corp. reported revenues for the third quarter ended Sept. 30 were $87.5 million, compared with $36 million in the same quarter one year earlier. Profits were $1.8 million, or 7 cents per share, compared with $882,000, or 3 cents per share, in the corresponding period one year ago.

■

Seeq Technology, Inc. announced profits for the fourth quarter ended Sept. 30 were $1.4 million, or 11 cents per share, compared with a net loss of $4.5 million, or $2.08 per share, in the like period last year. Revenues were $15.1 million, compared with $ 3.6 million in the same quarter one year earlier.

■

STC

from page 135

Fujitsu are really starting to come on stream," and are ready to jump in with the newer technology. The Japanese companies, he predicted, will each ship more disk drives next year than the entire domestic plug-compatible manufacturers were "hoping to ship this year."

Sharply limited focus

Most analysts believe STC might still salvage something, but that something will be a sharply reduced and limited focus, as opposed to the optimistic goals of simultaneously competing with high-end disk drives, developing optical storage and putting out a Cmos-based mainframe.

"I would not expect STC to fail," said James Porter, president of Disk/Trend, Inc., a Los Altos, Calif., market research firm. "I would expect it to have to shrink back somewhat to conserve cash and maybe to defer some of its newer programs."

Porter said STC is still delivering 3380 equipment drives and large quantities of tape drives, "so they have an excellent ongoing business."

He said STC's biggest in-house development program is the optical disk drive. Deliveries of that product reportedly are not scheduled until first quarter 1985. The other new program is STC's version of a tape drive to use IBM's 18-track tape drive program. If financing for these development programs is cut back as part of the reorganization, the company's long-term future may be grim indeed.

Most analysts seem to be waiting to see whether some other company — the Japanese and other U.S. computer companies are most often mentioned — will seek to acquire parts or the whole of STC. Fram, however, took a dim view of this alternative, wondering who would want to get into a business that looks so frail. Thomas Crotty of the Gartner Group, however, noted that STC has an established sales and support base, along with clean, modern manufacturing facilities.

The question the user community must face is whether any domestic company can survive IBM's massive power. STC, Memorex and CDC had yet to achieve full speed in manufacturing and distribution of IBM's 3380; yet IBM is widely believed to be preparing the announcement of two enhanced models. By the time any company could counter that, Big Blue would probably be ready with yet another step forward.

POSITION ANNOUNCEMENTS

We're Hiring Data Processing Professionals

Central and South West is a two plus billion dollar electric utility holding company offering competitive salaries, excellent benefits and stable working conditions. Our Information Services Department, as host center, provides services in a multi-company environment.

Our primary system software is MVS/SP1 with JES2. Additionally we use TSO/SPF, COBOL ROSCOE, and Command Level CICS. Our data base is IDMS. We were recently chosen to be one of Cullinet's beta sites for their new development software! We use Cullinet's 4th generation languages—ADS/O, OLM, CULPRIT, etc.

Each of our current openings needs people with proven analytical skills and user interface experience in addition to technical knowledge and abilities.

If we're the type of company you are seeking, and your experience is from a similar environment, please send your resume *and* salary requirements to the Employee Relations Department. Principals only.

Programmer/Analyst
(Business Applications)
Typical project assignments include construction project management, land management system, corporate shareholder system, etc.
Will provide technical expertise in system design, problem determination and system maintenance efforts. Should have JCL skills and online experience (CICS, VSAM) plus exposure to data base concepts.

Sr. Programmer/Analyst
(Engineering Applications)
Multi-project assignments offering multi-company exposure will include CAD/CAM, VM/CMS, transmission design, etc.
Will provide scientific/engineering expertise in system design and implementation efforts. Should have prior scientific/engineering application experience plus IDMS experience.

Programmer/Analyst
(Engineering Applications)
Initial assignment to the mining information management project will result in the development of a total, stand-alone system using state-of-the-art technology.
Will provide online and data base technical expertise in system design and problem determination efforts. Should have related technical skills developed from manufacturing related assignments. IDMS, ADS/O experience important.

Central and South West Corporation
P.O. Box 220164 • Dallas, Texas 75222

Central and South West Corporation is one of the nation's leading electric utility systems, having annual revenues of more than $2 billion. With corporate headquarters in Dallas, CSW serves more than four million people through its operating companies in Texas, Oklahoma, Arkansas and Louisiana.

Equal Opportunity Employer

SYSTEMS PROGRAMMERS

(Large Scale IBM)

Now is the time! We are the way! We have been retained by companies from Maine to California, from Boston to Miami, to find sharp, growth-oriented Systems Programmers who will accept a challenge if the reward is right. Over 150 qualified openings include:

DOS-OS Conversion	To $50K
DOS/VSE	To 40K
MVS/Internals	To 37K
MVS/XA	To 47K
IMS DB/DC	To 47K
CICS Perf Tuning	To 43K
PSB-PCB Gens	To 44K
Tandem (with TAL)	To 43K

(many more)

We guarantee 1) Professional Representation; 2) No charges of any kind; 3) Paid interview and relocation costs; 4) Confidentiality. Send resume or call collect (904) 398-KING for Steve or Bonnie.

JIM KING & ASSOCIATES
1840 Gulf Life Tower
Jacksonville, FL 32207

Large, fast growing company servicing over 200 banks in the Southeast's financial community has immediate openings for qualified applicants. First Financial Management Corporation offers excellent growth opportunities for experienced, career oriented professionals. For a challenging career in this dynamic organization applicant must meet the qualifications in one of the following areas:

Technical Support - Position requires a minimum of 3 years experience in Burroughs medium systems hardware and software support and a degree in computer science or business related field. Responsibilities include recommending system efficiencies and hardware planning.

Data Communications - Position requires a minimum of 3 years experience in communications planning, design and management with networks over 1500 stations. Degree in electrical engineering, computer science or related field required. Knowledge and experience with large Burroughs networks a plus.

For confidential consideration, send resume and salary requirements to:

First Financial Mgmt. Corp.

MANAGER, DATABASE ADMINISTRATION

Memorex, a Burroughs Company, has primary business interests in the design, development, manufacture and marketing of information storage and retrieval devices and data communications equipment. As such, we recognize the importance of providing our own data processing professionals with the tools they need to remain at the forefront of their technology. Our continuing efforts to maintain and improve the flow of vital business information has created a number of new career opportunities for data processing professionals with the following qualifications:

- Thorough knowledge of IDMS
- Knowledge and understanding of database control and performance monitoring systems
- Ability to provide technical direction to database analysts and applications development personnel
- At least seven years' experience as a database administrator, and a proven record as manager

When it comes to salary, benefits and advancement potential, you'll be sure to find more at Memorex. To apply for these excellent opportunities, please send your resume to Joyce Cordi, Memorex Corporation, MS 14-10, San Tomas at Central Expressway, Santa Clara, CA 95052. An equal opportunity employer. Principals only please.

When it matters, make it Memorex.

WYOMING

Higher Education Computer Network

The Wyoming Higher Education Computer Network (WHECN) is operated by the University of Wyoming to serve the administrative and instructional computing needs at the seven community colleges located throughout the State of Wyoming. Each college has substantial administrative and academic computers in addition to a connection to the CDC CYBER 835 and 760 computing facility at the University in Laramie. In support of this activity, the following position is available for immediate hire:

Coordinator
- Administrative User Services

This position will coordinate all administrative computing activities for the seven Wyoming Community Colleges. This includes systems programming (operating systems, utilities), software and hardware installation, applications and package support, as well as consulting services to administrators and staff. Graphics, communications and acquiring a totally integrated accounting package are some of the most active projects.

Each college has a Microdata Reality or Sequel computer system running the PICK operating system. Applications include payroll, accounts receivable, accounts payable, general ledger, registration and inventory. Some travel to each college will be necessary.

A bachelor's degree in Computer Science or a related field, or an equivalent combination of education and experience is required. At least two years of related experience in computer use and administrative applications is necessary. Knowledge of the PICK operating system is a definite plus.

This position will require some travel within the state. Starting salary will range from $21,336 to $26,712 depending on qualifications and experience.

This position offers a full University benefit package. Location is in Laramie, a pleasant city with a population of 25,000 in the Rocky Mountain area and home of the University, which serves 10,000 full-time students in all disciplines.

Qualified candidates should forward their resumes, current salary information, and three references with telephone numbers to Michael Walton, Manager, Wyoming Higher Education Computer Network, P.O. Box [illegible], University Station, Laramie, Wyoming 82071.

The University is an Equal Opportunity/ Affirmative Action Employer.

MANAGER COMPUTER OPERATIONS

THE PENNSYLVANIA STATE UNIVERSITY LIBRARY (LIAS)

COMPUTER OPERATIONS DIV.

The heart of Pennsylvania-Nittany Valley's center region and Penn State's library (LIAS) computer operations offers the best of all worlds, e.g. cultural events, a rural setting and a challenging work environment.

We are seeking a qualified individual who will be responsible for the scheduling, installations and maintenance of library computer resources. Duties include coordinating operations of multiple Honeywell CP-6 computers; overseeing operational activities at University Park Main Campus and the Commonwealth Campuses, correcting work-related program problems; assuring the integrity of schedules; monitoring and recommending program improvements in operational procedures, and assuring the security and organization of machine area.

Requires bachelor's degree or equivalent in technical area relevant to information systems development, plus 2 to 4 years of effective experience, preferably with large-scale computer systems involving data base, time sharing and transaction processing application. Verbal and written communication skills, analytical skills essential. Send letter of application, resume and salary requirements to:

WE'RE LOOKING FOR PEOPLE WHO AREN'T LOOKING.

Sales Opportunities

MIAMI/CORAL GABLES, CLEVELAND, NEW ORLEANS, PITTSBURGH & WASHINGTON, D.C.

OPPORTUNITIES ALSO IN CALIFORNIA, TEXAS, ARIZONA & MASSACHUSETTS LOCATIONS.

As a sales professional in the office automation industry, you want action, momentum, reputation and financial success. You're talking Businessland — one of the largest company-owned distribution channels in the business micro arena. Our Businessland Centers sell systems and solutions backed by the best products available — IBM®, Xerox®, Apple® Macintosh & Lisa 2, Corvus®, Burroughs®, Compaq®, 3Com® — displayed in custom designed, appealing showrooms. You'll be supported by the best in training on new systems, new software, new products — as will your customers.

With established Businessland Centers throughout the U.S. and an aggressive schedule to continually add new Centers, proven professionals can realize instant success and unparalleled earning potential.

Branch Managers

This is your next career move, as a proven sales management professional in the office automation industry where your demonstrated record of success has refined your sales, management and profitability talents. Now you're looking to manage your own multi-million dollar operation and it's here at Businessland in one of our sophisticated Centers. Using your dynamic leadership style, you'll select and develop your sales and service staff, be responsible for P&L and utilize your 5 years of sales management experience to set an aggressive tone for your — and Businessland's — further success. You'll be looking at a salary, bonus and incentive stock option plan that's among the best in the computer/office automation industry.

Computer Sales Professionals

Expand your sales skills — and earning potential as one of the professional team selling for Businessland. It's the smartest sales move you'll make. If you're a high energy, aggressive professional equipped with computer or electronic office equipment sales prowess, have a successful track record in selling to Fortune 1000 companies and the contacts you need to continue your success, you can be part of our rapidly expanding sales network selling systems solutions and office automation to the corporate business arena. You'll work on a "no-caps" pay plan designed to be the best in the industry, along with an employee stock purchase plan — your compensation will be as top-of-the-line as the products you sell. 3-5 years direct sales experience in hardware, software and services to major accounts and some knowledge of accounting applications are key requisites.

ACT NOW — CALL THIS WEEK!
It's the direct line to these key new opportunities.

Wang, the computer company leading in office automation with $2.1 billion in revenues and annual sales revenue growth of 42%, has excellent opportunities for talented professionals to share our success at Corporate headquarters in Lowell, Massachusetts.

PRINCIPAL SOFTWARE ENGINEER

In this challenging role, you will work in a small team environment at the forefront of office automation technology, and contribute to the architecture, design and implementation of next-generation record management systems. The successful candidate will be involved in the integration of multi-media office information processing and in the development of advanced document/image storage and retrieval capabilities. To qualify, you must possess a successful development track record and minimum of 3-5 years experience in database systems, office systems, distributed systems, and/or PC application. BS/MS in CS, or equivalent, essential.

VIDEOTEX DEVELOPMENT

As a key contributor to our Videotex project team, you will design and develop a host-based videotex system. To succeed, you should be a senior-level technical contributor with 3 or more years experience working with distributed applications. PL/1, COBOL or Assembler.

OFFICE AUTOMATION

Outstanding opportunities are now available for senior-level professionals to share the growth and state-of-the-art challenge of office automation systems technologies. Selected candidates will be part of the Wang OFFICE organization - a rapidly growing team dedicated to developing state-of-the-art office applications that combine imaging, graphics, voice and text for all Wang product lines. Specifically, you'll be involved in the design and development of network-based products dealing with electronic mail, office filing, file transfer services, time management and forms interface to relational DMBS. Candidates must have 3 or more years experience in the areas of networking, human factors, and/or database. Knowledge of "C" or PL/1 preferred.

Leading the way in benefits.

Wang offers one of the best benefit programs in the industry including profit sharing, stock bonus, long term stock option, stock purchase and incentive saving plans, company paid dental, medical and life insurance, tuition reimbursement, adoption assistance and our employee country club.

Contact us today.

Send resume including salary history to Susan LaPointe, M/S 1379, Wang Laboratories, Inc., One Industrial Avenue, Lowell, Massachusetts 01851.

We are an affirmative action employer.

WANG

We put people in front of computers.

Opportunity in Management Consulting

San Francisco

We are an international consulting firm seeking to expand our Management Consulting Services to meet growing client demands. You will work directly with clients, and must possess excellent written and oral communication skills. Prior consulting experience is desirable but not required for qualified candidate.

Telecommunications

Opportunity for senior (three to five years' experience) consultant.

The successful candidate should have a BSEE or BSCS and demonstrate knowledge and experience in several of the following:

- Network Operation Management
- Longhaul and Wide Area Data Networks
- SNA
- Micro to Mainframe Networking
- Microwave and Satellite Communications

Responsibilities will include planning, design specification and implementation of all elements of data communication systems for clients.

If you believe you qualify and are willing to make a commitment to our growth, reply in confidence with resume and salary history to: **Arthur Young & Company, Director, Management Consulting Group, One Post Street, San Francisco, California 94104. Attention: Department TC-2969.** An equal opportunity employer m/f.

PROJECT MANAGER/ SOFTWARE INTEGRATION SPECIALIST
$52,200 - $67,900

The Social Security Administration, located in suburban Baltimore, Maryland, is implementing major, on-line interactive systems to support its various retirement, disability and income assistance programs. These systems will be accessed through 17,000 terminals at our 1300 nationwide offices, and involve very large data bases operating in a CICS/SNA/VTAM/COBOL environment.

We are seeking a technical project manager to oversee and coordinate the development and implementation of the Software Engineering Program of our Systems Modernization Plan. The plan represents an unprecedented, highly complex systems engineering effort and calls for a complete replacement of our existing hardware and software with state-of-the-art integrated systems. To complete the upgrade without disturbing the current ADP operation is a monumental task.

This position requires responsible, professional experience at a senior level within the past five years:

- Managing or overseeing the design and implementation of large software systems that use a DBMS.
- Managing the acquisition of ADP equipment, software and services.
- Demonstrating project management experience over large systems projects involving complex integration requirements.

TO APPLY: Submit a resume or a Personal Qualification Statement SF-171 (available at all Federal Job Information Offices) to: Social Security Administration, Systems Recruiting A-CW, 6401 Security Boulevard, Room G-120 West High Rise Bldg., Baltimore, Maryland 21235, ATTN: Mr. Larry Valentine, (301) 594-3734.

Applications must be postmarked no later than Nov. 30, 1984.

U.S. Citizenship Required

An Equal Opportunity Employer

A Chance To Break Into The Business Mainstream And Prove Your Technical Talents.

Systems Development Professional

Pacific Telesis is presently assembling a team of high calibre managers to launch an innovative network service product into the marketplace. Systems development and data processing will be the backbone of our service and key to our business success.

You'll be at the heart of our product design team, developing from inception the entire system architecture. Your technical talents combined with an entrepreneurial spirit are the essential attributes for membership in this start up group. This is an ideal position for a degreed person with a demonstrated record of results in the MIS field. You should possess at least three years of experience in a supervisory capacity and have equal years of experience in one of the following service industries: telecommunications, banking, financial, insurance, transportation or distribution.

As part of the new breed at Pacific Telesis, you'll be among the doers and explorers of an exciting age and industry. And you can expect an outstanding compensation and benefits package with unlimited opportunities for career growth. For consideration, please forward your resume with salary history to: Director, Pacific Telesis, Management Employment, One Montgomery Street, Room 970, Crocker Center West Tower, Dept. MLS, San Francisco, CA 94104. We are an equal opportunity employer.

Computer Systems Marketing Representatives

Your Future is on the Line.

All It Takes Is One collect Call To Honeywell Monday-Friday, 9am - 5pm

Your future in computer systems marketing is waiting for you at Honeywell. Our Information Systems Division is launching an aggressive expansion program in our regional marketing operation. This recruitment effort is to support what we consider to be the most comprehensive line of computer products, applications and solutions. "Honeywell means total solution selling."

As a member of our multi-billion dollar computer company, you'll be selling not only a broad range of computer products that have achieved outstanding acceptance in the marketplace—you'll be marketing fully integrated systems solutions that address specific user needs.

At Honeywell, you will also work with the finest technical pre-sales marketing support teams around. And you'll be rewarded with one of the best compensation packages in the industry. A package that includes an attractive base salary, commissions and benefits.

Positions are available for seasoned professionals with 3-5 years' experience selling computer systems to end users, OEM's or value-added resellers. Specific experience in Office Automation Systems, Networking Systems or Manufacturing Systems is desirable. Markets include, but are not limited to, government, institutions, banking/insurance, retail/distribution and manufacturing.

Openings are available in the following cities throughout the U.S.

NORTHEAST: Boston, Hartford, Westport, Syracuse, Buffalo.

Phone collect, Deborah L. Williams (617) 593-7828, Honeywell Information Systems, Inc., 3 Newton Executive Park, 2223 Washington Street, Newton Lower Falls, MA 02162.

UNITED AIRLINES

COMPUTER SYSTEMS ENGINEER

As a leader in the airline industry, we require the best professionals available. We have an immediate opening at our northwest suburban Chicago Corporate Headquarters for a Computer Systems Engineer.

This challenging corporate position involves the development of our automation and information systems architecture integrating long range distributed processing objectives. At least 2 years of architecture planning experience in a large scale computer/communications systems environment and knowledge of physical and logical systems design essential. BS in Computer Science or Electronic Engineering required.

United offers competitive salaries and a benefits package that includes pass/reduced fare air travel. For consideration, send resume including salary history to: Professional Employment/EXOPX-CWT, United Airlines, P.O. Box 66100, Chicago, IL 60666. *Equal Opportunity Employer.*

Data Access Systems, Inc.

JOIN A LEADER

We lead the nation as a distributor in the sale, lease and service of microcomputers, terminals and peripherals from such quality manufactures as IBM, DEC, TI, Diablo, Wyse, Epson, Hayes and many more. With 17 sales and 22 service locations across the country, we offer the right people the opportunity to make a career with DASI. We deal with Fortune 1000 corporations, have an excellent product line, a multi-million dollar inventory and our own on-site maintenance.

Sales Reps: We are looking for people with a high energy level, at least 2 years experience in the sale of PC's, terminals and telecommunications. We supply you with all the necessary sales tools including good territories, an excellent base salary, high commissions, company car and full benefits package.

District Sales Managers: Work for us if you are a dynamic self-starter with a proven management track record in the sale of PC's, terminals and telecommunications. With openings nationwide, we offer you an excellent base salary, high commissions, overrides, company car and full benefits package.

Regional Managers: Here's an excellent career opportunity for two accomplished Sales Management professionals to take charge of multiple District Sales Offices. One in the East and the other in the Central Region. Bring a proven track record in generating top line results from a remote sales force through managing managers, and a solid knowledge of the PC, terminal and telecommunication marketplace, and one of these positions may be yours. Excellent base salary, company car and full benefits. Degree required. Some travel required.

Marketing Manager: We want a real achiever with a minimum of five years computer industry experience in the PC, terminal and telecommunications area. Field sales experience helpful. Report directly to the President in this high salary plus bonus position. Corporate office location in suburban Philadelphia. Degree required. MBA preferred.

If interested in any of the above positions, please send resume, in confidence to:

NATIONAL UNIVERSITY OF SINGAPORE

INSTITUTE OF SYSTEMS SCIENCE

We require Teaching and Development staff in the following areas:

- Information Resource Management
- Project Management
- Systems Development Methodologies
- Data Base Management Systems
- Data Communications
- Office Automation
- Microcomputer-based Information Systems
- Local Area Networks

THE JOB

You will be working in small teams to develop short intensive courses aimed at upgrading the skills of executives, users, IS managers and IS professionals from organisations in Singapore and South East Asia. You will also participate in teaching a Diploma in Systems Analysis. In addition you will have opportunities to engage in consultancy and applied research.

ISS provides a stimulating environment for state-of-the-art practitioners from a variety of backgrounds to interact and develop through close teamwork.

THE INSTITUTE

Established in 1981 by the Singapore government, ISS is focused on promoting the rapid development of leading edge computerisation both in the public and private sectors, and participating in the development of Singapore as a regional center for software development and services. Technical leadership is asserted through quality management education, advanced technical training, consulting services and applied research. ISS has excellent educational and computer facilities.

SINGAPORE

Singapore is well known as a commercial, financial, industrial and communications center in South East Asia. Vigorous economic growth persists, and it has the second highest per capita income in Asia after Japan. American and British expatriates have consistently rated Singapore as one of their top 3 overseas postings.

APPLICANTS

Applicants should have a strong practical background in at least one of the areas mentioned and be motivated towards a job involving a substantial portion of development and teaching of leading edge material.

Applicants for positions at a more junior level are likely to have 3 - 5 years of experience.

COMPENSATION

Salary (to US$60,000/year) is commensurate with experience. Benefits include an additional 20% Provident Fund contribution, heavily subsidised housing, medical and leave benefits, passage assistance and baggage allowance, settling-in allowance and children's education allowance.

Application forms and further information on conditions of service may be obtained from:

Insurance

GENERAL CASUALTY COMPANIES

Programmer/ Analysts

The General Casualty Companies, a progressive property/casualty company is seeking multiple computer professionals to expand its Data Processing staff.

Sr. Programmer/Analysts

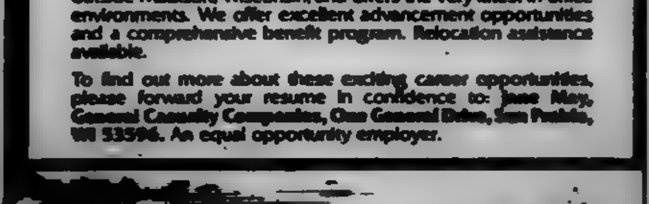
These individuals should have 3 to 10 years IBM COBOL experience, knowledge of OS/VSI or MVS operating systems and 2 to 5 years of property/casualty insurance background desired. Project Leader or C.I.C.S. experience a plus. ASSEMBLER experience would be helpful. Candidates should be experienced in performing assignments at a high level of system analysis/programming ranging from modification to existing programs, to the development of new complex systems.

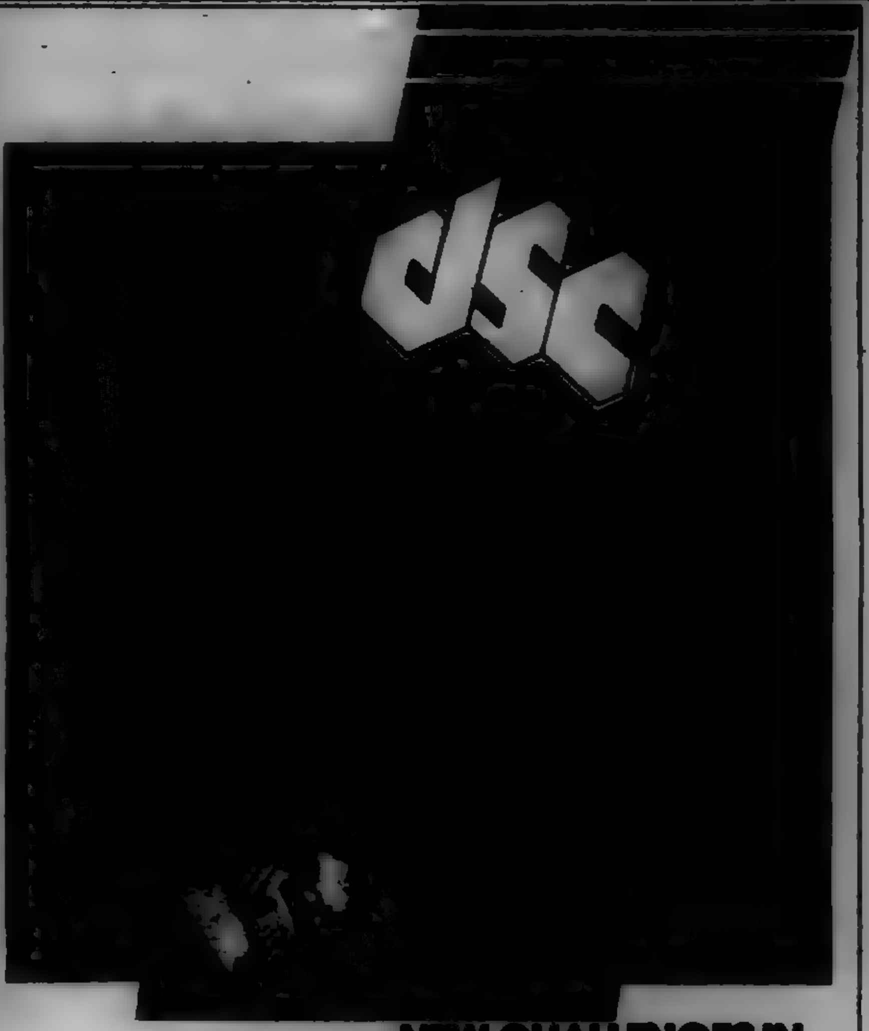
Programmer/Analysts

Candidates should be competent in most phases of application systems analysis/programming ranging from simple modifications to the development of systems. Two to 5 years IBM COBOL experience and knowledge of OS/VSI or MVS operating systems necessary and 2-3 years of insurance background helpful. Project Leader or C.I.C.S. experience a plus. Candidates with ASSEMBLER experience will also be considered.

These opportunities are in our beautiful home office located just outside Madison, Wisconsin, and offers the very latest in office environments. We offer excellent advancement opportunities and a comprehensive benefit program. Relocation assistance available.

To find out more about these exciting career opportunities, please forward your resume in confidence to: **Jane May, General Casualty Companies, One General Drive, Sun Prairie, WI 53596.** An equal opportunity employer.





NEW CHALLENGES IN TELECOMMUNICATIONS DESIGN AND DEVELOPMENT

The explosive growth of telecommunications, and the many technological advancements supporting this growth, are in a large measure the result of advances in digital switching technology. At Digital Switch Corporation, we are committed to taking on the challenges this age of communication has created by providing state-of-the-art switching systems adaptable to the most advanced techniques of information exchange.

If your background is in telephony design and development with experience in any of the following areas, we invite you to share this technological adventure with us.

CALL PROCESSING

Design and development of real time telephone attendant, trunk control and call processing software.

MAINTENANCE/DIAGNOSTICS

Design and development of configuration, control and diagnostics software for distributed processing systems.

OPERATING SYSTEM

Design and development of real-time operating systems software for distributed microprocessor based systems. Software includes: nucleus (process and memory management, inter-process communicators) debugger, processor start-up, file management and utilities, data link communication protocols, and man-machine interface.

SWITCH ADMINISTRATION

Design and development of distributed processing software for database management, system performance monitoring (traffic measurements), call data recording (AMA), system overload management, and telephone network management.

HARDWARE DESIGN

Design experience should include microprocessor communication interfaces, peripheral controllers and memory systems. Minimum of three years experience designing T1 interfaces, lines or trunks for digital control offices. PABX's or subscriber carrier equipment. Familiarity with Z80, Z8000 or other microprocessors, as well as dynamic Ram components is a must.

SYSTEMS ENGINEER

Will be involved in analyzing product system requirements, resolving hardware/software system architecture trade-offs, generating system level specifications for new products and providing enhancement specifications for existing products. Will help to prepare proposals and presentations and be involved in customer interface. Must be aware of the state-of-the-art feature requirements as they apply to telecommunications, with strong background in hardware and software development and systems level design.

SYSTEM INTEGRATION AND SUPPORT

Hardware and software test and integration on system level. Interface with customer and field operations.

All positions require a BS/MS CS, EE, Math or related discipline. Experience with Assembly language and/or "C" highly desirable.

We can offer excellent technical resources, salary and benefits, and the chance to apply new thinking to complex engineering problems.

For immediate consideration, please send resume to: Staffing Manager, Digital Switch Corporation, Dept. 1800 CW1112 , P.O. Box 830911, Richardson, TX 75083-0911.

UNIVERSITY OF OTAGO
Dunedin - New Zealand
NETWORK AND COMMUNICATIONS SPECIALIST
Computing Centre

The University of Otago invites applications for the position of Network and Communications Specialist in the Computing Centre. This is a newly created position reflecting the importance that the University attaches to the development of computer networking on campus.

The successful candidate will have a university degree in Computer Science or a related discipline and preferably have a postgraduate degree. Considerable experience in networking and communications is mandatory and those with recent and diverse experience in implementation of network systems will be given preference.

The Network and Communications Specialist will help in the formulation of policy regarding the development of the campus network of computers and also be responsible for the implementation of our network development strategy.

Dunedin is a small city near the south of the South Island of New Zealand. It is built around a picturesque harbour surrounded by hills. New Zealand has a low population density and offers great potential for the outdoor life with clean air and clear water. Sizeable portions of the country are set aside as National Parks.

The position carries the grading of Assistant Registrar and the initial salary will be on the scale within the range NZ$[illegible] 335 - NZ$[illegible] 750 per annum. Appointment at a higher level than this may be considered for a suitably qualified applicant. There is currently a cost of living adjustment of NZ$417 per annum.

Further particulars, including method of application, can be obtained from the Secretary-General, Association of Commonwealth Universities (Appointments), 36 Gordon Square, London WC1H 0PF, or from the undersigned, PO Box 56, Dunedin. Applications quoting [illegible] close in London and Dunedin on 15 December 1984.

SAUDI CONSOLIDATED ELECTRICITY COMPANY IN THE WESTERN REGION

M.I.S. OPPORTUNITIES

Saudi Consolidated Electric Company in the Western Region(EWR)is one of Saudi Arabia's major electric utility companies. Its service area includes the city of Jeddah on the Red Sea where its Headquarters are located. EWR intends to consolidate and integrate its information systems under a five-year master plan. It seeks competent professionals to fill the following key positions in its MIS Department at Headquarters:

DIRECTOR OF MIS - Plan, direct and control all MIS functions; be responsible for execution of the MIS master-plan. Requires comprehensive MIS experience, with five years in management positions.

MANAGER OF SYSTEMS DEVELOPMENT - Manage development and implementation of planned application systems; exercise centralized control over developmental activities. Requires extensive experience in systems development, with four years in a supervisory capacity.

MANAGER OF DATA RESOURCES - Manage the company's migration from a conventional data processing to a data-base environment. Requires practical experience in developing and successfully implementing shared data-bases, with four years in a supervisory capacity.

MANAGER OF SUPPORT SERVICES - Manage a support group to plan and administer MIS training programs, and MIS standards and procedures. Requires broad MIS experience, with four years in a supervisory capacity; skills in either training or standards and procedures.

MIS TRAINING CO-ORDINATOR -Plan, co-ordinate and deliver training programs for users and MIS personnel. Requires broad MIS experience, with two years in MIS training.

STANDARDS AND PROCEDURES CO-ORDINATOR - Establish and administer standard procedures and practices in all areas of MIS; monitor compliance with them. Requires broad MIS experience, with two years in a similar function.

SYSTEMS ANALYSTS - Design, develop, document and implement assigned application systems. Requires knowledge of business functional areas and systems analysis techniques; two years relevant experience.

PROGRAMMERS - Design, code and test programs to specifications. Requires knowledge of program design techniques; programming skills in COBOL (and preferably other languages); two years relevant experience.

All positions require a University or College degree in Computer Science, Business Administration, Engineering or other relevant discipline.

EWR offers attractive salaries and fringe benefits to the suitable candidates according to their qualifications and experience. The benefits include three months' basic salaries annually as housing allowance,30 days leave on completion of 11 months service; Economy class air ticket for self, wife and two children as per rules of the Company; free medical treatment; working hours - 8 hours a day and 6 days a week.

Please reply in confidence, with your resume, salary history, contact address and telephone number to:

Computerware Services
A Division of Computerware, Inc.
12801 Nicholson Road, #200
Dept. 10
Dallas, TX 75234
(214) 620-2601

Look to Dallas for a dynamic place to live.

At E-Systems you will have opportunities that most engineers just dream about — opportunities to work on long-term projects that will put you on the leading edge of technology in command and control, reconnaissance, and other highly advanced electronics systems.

Plus, with a career at E-Systems in Dallas, you will have the opportunity to enjoy everything that makes Dallas one of the most enjoyable and livable areas in the United States.

There is another plus. E-Systems offers salaries and benefits that compare with the best anywhere.

If joining E-Systems in Dallas means a move, we will help you with our personalized relocation program. Dual career assistance is an integral part of our program.

Right now, E-Systems is interested in talking to the following Software Professionals:

TANDEM SYSTEMS SPECIALIST: Responsible for participating in the definition of system architecture in response to requirements which stress the Tandem System capabilities. The candidate will have Tandem Guardian Operating System expertise and can translate the guardian capabilities to a system architecture. The system requirements include a large number of external interfaces/protocols with high data rates, fail soft and low system response times.

BUSINESS PROGRAMMER ANALYST: Responsible for development and maintenance of on-line systems in an IBM OS/MVS IDMS CICS environment. Must have a college degree in Business, MIS or related field, and three to five years experience developing/maintaining on-line systems, supporting Accounting, Manufacturing or Purchasing/Inventory control.

DATA BASE ADMINISTRATOR: Responsible for the installation of IDMS in an IBM OS/MVS environment, for the design and maintenance of the data base and related data dictionary, and for the development and enforcement of standards and procedures for its usage. Requires a college degree and three to five years data base Design/Administration experience.

STAFF ENGINEER: Responsible for coordination/integration of systems-level technical activities, including establishing operations concepts, allocating requirements to production and reviewing/approving production specifications. Extensive (12 years) systems-level software experience required.

SR. ENGINEERING SPECIALIST: Responsible for the generation of system-level testing documentation, including system verification, transition and installation. Requires extensive (10 years) system-level hardware and software integration experience, including microprocessing/minicomputer experience and mainframe distributed control networks.

ENGINEERING SPECIALISTS: Responsible for the generation of the system, verification plan and coordination of intersegment demonstrations. Some are also responsible for the coordination of hardware interface design. Positions require experience (8 years) in large system integration and/or hardware design with system level software control knowledge.

SR. SYSTEMS ENGINEER: Responsible for the format and content of interface specifications, including operations-hardware, hardware-software and operations-software interfaces. Systems operations concepts and documentation experience required.

FIRMWARE DESIGNERS: Responsible for writing significant firmware packages using the 68000 microprocessor with real time operating systems, utilizing the latest in firmware development tools. Three or more years experience in ASSEMBLY language applications and real time controllers a definite plus.

If you are looking for new career challenges, then E-Systems Garland Division could be what you are looking for. We will offer you the opportunity to develop new ideas in a warm, friendly atmosphere where people really care about you. We invite qualified individuals to contact. **Tom Shepherd, Staffing Manager, E-Systems, Inc., Garland Division, P.O. Box 660023, Dept. 41LX, Dallas, Texas 75266-0023.**

PSFS

COMPUTER PERFORMANCE ANALYSTS

Salary to Lower $40's

PSFS, the largest bank headquartered in Phila., is seeking experienced Computer Performance Analysts in the Technical Services Group of its General Operations Division.

Responsibilities include measuring, analyzing and reporting on computer performance and formulation and presentation of related recommendations. At least 5 years of experience in computer capacity planning and performance measurement is required.

Opportunities for growth are excellent within PSFS' dynamic, state of the art professional environment. The bank's large scale IBM hardware includes IBM 3081 & 370/168 MP systems running in a large communications network with IMS, CICS & TSO under MVS.

These positions are complemented by excellent salary review, profit sharing, and medical, dental and life insurance plans.

Qualified applicants should submit a resume including salary history to: Mrs. Sandra Close, PSFS, 12 S. 12th St., Phila., PA 19107.

Equal Opportunity Employer M/F

OFFICE AUTOMATION MANAGER

In its rapid rise to the top of the Office Interior Systems Industry, Haworth, Inc. has always staked its success on those individuals who have dared to lead. If you're a take-charge professional with the ability to make things happen, Haworth has an outstanding career for you as Manager of its expanding Office Automation Function.

Primary responsibilities are planning and implementing office technology throughout Haworth to improve productivity.

The Manager will be responsible for analyzing corporate office automation needs, user consulting, researching, designing, selecting and installing the state-of-the-art systems as well as training users in their operation. This individual will have a staff of 6-8 internal consultants who will assist in this process. The major emphasis of this responsibility will be in the areas of customer service and user training.

The ideal candidate for this position will possess a Master's Degree or equivalent experience with a strong background in the selection and installation of office automation technologies, mainframe applications, office system planning and supervision. Additionally, candidates must have excellent interpersonal communication skills in a participative management environment.

This is your opportunity to lead Haworth in the exciting field of Office Automation. In addition to the satisfaction you'll find at work, we offer a complete fringe benefits package, generous relocation assistance, and best of all, a chance to act on your initiative. That's what being a leader is all about.

To apply, please send your resume, detailing salary history, in complete confidence to:

Henry Oberski wanted a challenge...
We found it for him.

Henry Oberski had been in the data processing field for a number of years before he first came to us. His education was most impressive. His EDP experience was extensive, to say the least. The problem was that, over the years, Henry had provided solutions to dozens of various challenges. He was, as a result, becoming bored with his work.

Henry was quite specific about what he wanted to do and that, indeed, became a real challenge to us. We had nothing immediately available to meet his requirements. So, we made a tremendous number of client contacts and, in time, we found a challenge that was the peak in Henry's professional life. Now he's happy and we're happy for him.

So, you see, NCA is not limited to routine placement services. Career advancement... we do it all... and no one does it better. Come in. Call. Or mail your resume to the NCA firm nearest to you. Confidentiality is assured. Company clients assume our fees.

EDUCATION

Your Strategic Career Choice

Does your career need a strategic boost? If so, you should consider Dartmouth's professional program in the design and management of information systems.

Our two-year Master's program is designed to equip tomorrow's information systems managers to play a leading role in the design and development of effective business solutions to business problems. We offer a blend of technological, management, and communication skills, and a record of career advancement.

Students in Dartmouth's CIS Program spend one term as interns in a variety of sponsoring organizations. On campus, they study the broad fundamentals of information systems, networks and distributed processing, current analysis and design methodologies, database management systems, communication and management skills crucial to effective planning and implementation, and the social, ethical, and organizational issues related to information systems. Case studies and guest lectures by practicing managers of information systems and professionals-in-residence are regularly featured.

If you have previous experience in the computing field but want to be equipped to assume more responsibility and leadership, why don't you consider joining us next year? For more information, write:

General Request for Proposal No. 984 due 3:30 p.m., Tuesday, December 11, 1984, for the acquisition of IBM 3270 compatible CRT's, printers, and controllers. This is a general RFP to be used to select terminals for the State of Mississippi through 1985.

General Request for Proposal No. 985 due 3:30 p.m., Tuesday, December 11, 1984 for the acquisition of microcomputers, peripherals and software. This is a general RFP to be used for acquiring micros for teaching, data acquisition and a variety of other purposes for the State of Mississippi during 1985.

General Request for Proposal No. 986 due 3:30 p.m., Tuesday, December 11, 1984, for the acquisition of small, microcomputer-based CAD systems, graphics terminals, plotters and related peripherals. This is a general RFP to be used to select graphics equipment for the State of Mississippi through 1985.

General Request for Proposal No. 987 due 3:30 p.m., Tuesday, December 11, 1984, for the acquisition of ASR and KSR hardcopy terminals. This is a general RFP to be used to select terminals for the State of Mississippi during 1985.

General Request for Proposal No. 988 due 3:30 p.m., Tuesday, December 11, 1984, for the acquisition of receive-only printers to attach to TTY compatible CRT's. This is a general RFP to be used to select printers for the State of Mississippi during 1985.

General Request for Proposal No. 989 due 3:30 p.m., Tuesday, December 11, 1984, for the acquisition of TTY compatible CRT's. This is a general RFP to be used to select CRT's for the State of Mississippi during 1985.

General Request for Proposal No. 990 due 3:30 p.m., Tuesday, December 11, 1984, for the acquisition of acoustic couplers. This is a general RFP to be used to select couplers for the State of Mississippi during 1985.

General Request for Proposal No. 991 due 3:30 p.m., Tuesday, December 11, 1984, for the acquisition of low to medium speed synchronous and asynchronous modems ranging in speed up to 3600 baud. This is a general RFP to be used to select modems for the State of Mississippi through 1985.

General Request for Proposal No. 992 due 3:30 p.m., Tuesday, December 11, 1984, for the acquisition of medium, high, and wideband modems ranging in speed from 4800 through 56K baud. This is a general RFP to be used to select modems for the State of Mississippi during 1985.

General Request for Proposal No. 993 due 3:30 p.m., Tuesday, December 11, 1984, for the acquisition of short haul modems, line drivers and modem eliminators. This is a general RFP to be used to select special purpose modems for the State of Mississippi during 1985.

Request for Proposal No. [illegible] due 3:30 p.m., Wednesday, November 28, 1984, for the acquisition of a minicomputer to be used for data acquisition and general data processing for the Physical Acoustic Research Laboratory at the UNIVERSITY OF MISSISSIPPI.

Detailed specifications may be obtained from the CDPA office. The CDPA reserves the right to reject any and all bids and proposals and to waive informalities.

34, 36, 38, WHO WILL YOU APPRECIATE?

Dataserv.
We're your one-stop shopping center for IBM systems and peripherals.

Before choosing an equipment vendor you'll want to consider…

- *Availability—Can they deliver on time?*
- *Selection—Do they have inventory or access to the* **specific** *model with the features you need?*
- *Expertise—Are they experienced at putting together the right package?*
- *Financial Flexibility—Can they offer multiple buy/sell/lease options with flexible terms at competitive rates?*
- *After Sale Support—Will they be there when you need them?*

Dataserv has been in business for 15 years and we've participated in thousands of transactions totalling almost 1 billion dollars.

We're a leading source for S/34, S/36, S/38, Series 1, and DPD Systems. Before making your next computer decision, ask us for a QUIKQUOTE.™

Call TOLL-FREE 800-328-6729.

SECURITY YOU CAN BANK ON... ONLY FROM RANDOLPH.

As an important part of the First National Bank of Boston, one of the nation's oldest and leading financial institutions, Randolph has a built-in financial stability that continues to be unique in the third-party computer leasing industry.

In 1972 The Bank of Boston purchased Randolph's S/360 assets through a subsidiary, Firstbank Financial Corporation, to become the first bank in the United States to enter the business of leasing and financing computers.

SAVE MONEY WITHOUT LOSING SLEEP. This kind of financial security gives assurance that Randolph will continue to provide high-quality lease-financing for all of IBM's computers and related equipment . . . to live up to the terms and conditions of its agreements . . . provide upgrades . . . and fulfill all of its commitments . . . and at the same time save you 30% to 70% of your hardware dollars.

THERE ARE OTHER KINDS OF SECURITY. At Randolph, our people have an average of 18 years in the DP industry . . . from 360's to 3084's. They know all about alternative financing to be sure, but they also know their way around a DP department and the hardware in it. This kind of professionalism is important where you get into situations that involve upgrades and reconfigurations.

CALL OR WRITE FOR OUR RATES. You'll find our rates low and terms flexible. Call now. Joseph B. Kelly, Jr., Executive Vice President, 800-243-5307.

COMPUTERWORLD

COMPUTERWORLD's paid circulation climbed to over 125,000 this spring. Folio 400 (Folio Magazine's study of trade publication performance) placed us first in total revenue. As the industry grows, so will COMPUTERWORLD. It will continue to offer the high quality news coverage and editorial content that has attracted its readers. What does that mean to you, our advertisers? Good news...in the form of wide exposure.

The Classified section of the newspaper is laid out in an attractive format and is easy to read. It offers classifications to solve a variety of problems: **Position Announcements, Positions Wanted, Buy • Sell • Swap, Software for Sale, Software Wanted, Time & Services, Real Estate, Publications, Bids & Proposals, Auctions, Seminars & Conferences and The Bulletin Board.**

Our **BULLETIN BOARD** section is ideal for the smaller companies who want a low-cost way to sell pieces of equipment (hardware or software). The **BULLETIN BOARD** is laid out as a quick reference for potential buyers who know what they are after.

So, as a nationwide publication, we give you the exposure you want. As a weekly publication, we give you the immediacy your advertisements need.

- November 26 will be a special issue of **COMPUTERWORLD**. It will focus on Data Communications Terminals.

COMPUTERWORLD publishes every Monday with an ad deadline of 10 days prior to each issue date. You may send in copy to be pubset or camera-ready material (velox or negative) via the mail. We provide telecopier service and will also take ads over the phone.

Information concerning classified advertising rates, color costs, ad sizes, mechanical specifications along with more detailed information on the special issues is contained in the 1984 Rate Card #19 and Media Kit.

Our mailing address is **COMPUTERWORLD, Classified Advertising, 375 Cochituate Road, Box 880, Framingham, MA 01701.** Or call for more information at **1-800-343-6474** or, in Massachusetts, **(617) 879-0700**

CLASSIFIED ADVERTISING ORDER FORM

Issue Date: Ad closing is every Friday, 10 days prior to issue date.

Sections: Please be sure to specify the section you want: Time and Services, Software for Sale, Position Announcements and Buy Sell Swap. (Available upon request: Positions Wanted, Software Wanted, Real Estate, Education, Business Opportunities, Bids and Proposals, Auctions, Publications, Seminars and Conferences).

Copy: We'll typeset your ad at no extra charge. Please attach clean typewritten copy. Figure about 25 words to a column inch, not including headlines. Any special artwork should be enclosed with your ad also. Logos must be submitted on white bond paper for best reproduction.

Cost: Our rates are $128.10 per column inch. (A column is 1 13/16" wide.) Minimum size is two column inches (1 13/16" wide by 2" deep) and costs $256.20 per insertion. Extra space is available in half-inch increments and costs $64.05. Box numbers are $15.00 extra, per insertion.

Billing: If you're a first-time advertiser, (or if you have not established an account with us) WE MUST HAVE YOUR PAYMENT IN ADVANCE. A purchase order number is also acceptable. Any questions concerning establishing an account should be directed to our Credit Department.

Ad size desired: _____ columns wide by ____ inches deep.

BIDS & PROPOSALS

Request for Statement of Interest
CITY AND BOROUGH OF JUNEAU
RSI No. 85-119
PROPOSALS for
SOFTWARE PACKAGES

The City/Borough of Juneau, Alaska will issue a Request for Proposal for integrated municipal accounting software packages designed to run on the Wang VS80 CPU.

Only those packages that accommodate the generally accepted fund accounting principles will be considered.

Vendors who wish to receive a copy of the Request for Proposal should submit their name and address by November 16, 1984 to:

City/Borough of Juneau
General Services Division
155 South Seward Street
Juneau, Alaska 99801

The City and Borough is an affirmative action purchaser and encourages small, minority and female-owned businesses to submit their bids.

ORDER FORM
COMPUTERWORLD BULLETIN BOARD

Issue Date: Ads can be accepted up until the Monday preceding the issue desired. Computerworld comes out every Monday.

Classifications: Most ads will be classified according to the brand of equipment that is being bought or sold. These classifications include Burroughs, Data General, Digital/DEC, Hewlett Packard, Honeywell, IBM, NCR, Sperry Univac, Salvage, Terminals, Misc. Systems and Miscellaneous.

Copy: Copy sent in via the mail or telecopier (telecopier extensions are 410 and 461) should be clearly typewritten. Ads may be given over the phone to our team of ad takers. The standard size is 1 column by 1 inch deep. These units may be combined to form larger sized ads. Describe the equipment very briefly, give the price and the name of the person to contact. All ads will be set up using a standard format. No borders or logos are allowed.

Cost: The price for each standard unit is $130.00 (One unit minimum and no fractional units allowed.) There are no agency commissions and no quantity discounts.

Billing: Once you've written your ad, send (or call) it in with your name and address for billing purposes and we'll run it. (If your company has never advertised with us before, we request a check with your order.)

IF YOU WANT THE BEST APPLICATIONS DEVELOPMENT TOOL, TALK TO THE PEOPLE WHO DEVELOP THE BEST APPLICATIONS.

Of all the applications development tools ever designed, only one has the proven success of our new Millennium SDT.

Because Millennium SDT was designed by McCormack & Dodge, a company with over a decade of proven success developing applications. Business applications used in over thirty countries. By the world's biggest and most demanding corporate clients.

M & D design teams have developed everything from accounts payable to payroll/personnel software. Recently, they've won industry acclaim for developing the only family of systems on the market with a genuinely borderless environment. The Millennium series.

What made the Millennium series possible was our discovery of Millennium SDT, a remarkable tool based on a remarkable truth: eighty percent of the functions in all applications are, in fact, generic. Which means that 80% are reusable.

This discovery allowed us to vastly simplify and accelerate our entire systems development process. Tasks that once took months suddenly took days. And we were able to bring a breakthrough product line to the marketplace well ahead of our competition.

If Millennium SDT revolutionized our systems development process, think of what it can do for yours. You'll make more efficient use of your data processing resources than you ever thought possible.

And just to give you an idea of how fast our applications development tool works, we've included your first application in this ad. All you do is find the dotted lines, fill in the requested information, mail the completed form, and wait for the postman to bring a packet of important information. And, if you're in a real hurry, call 1-800-343-0325.

Soon your backlog will begin to disappear. You'll be a Millennium ahead.

START WITH THIS APPLICATION.

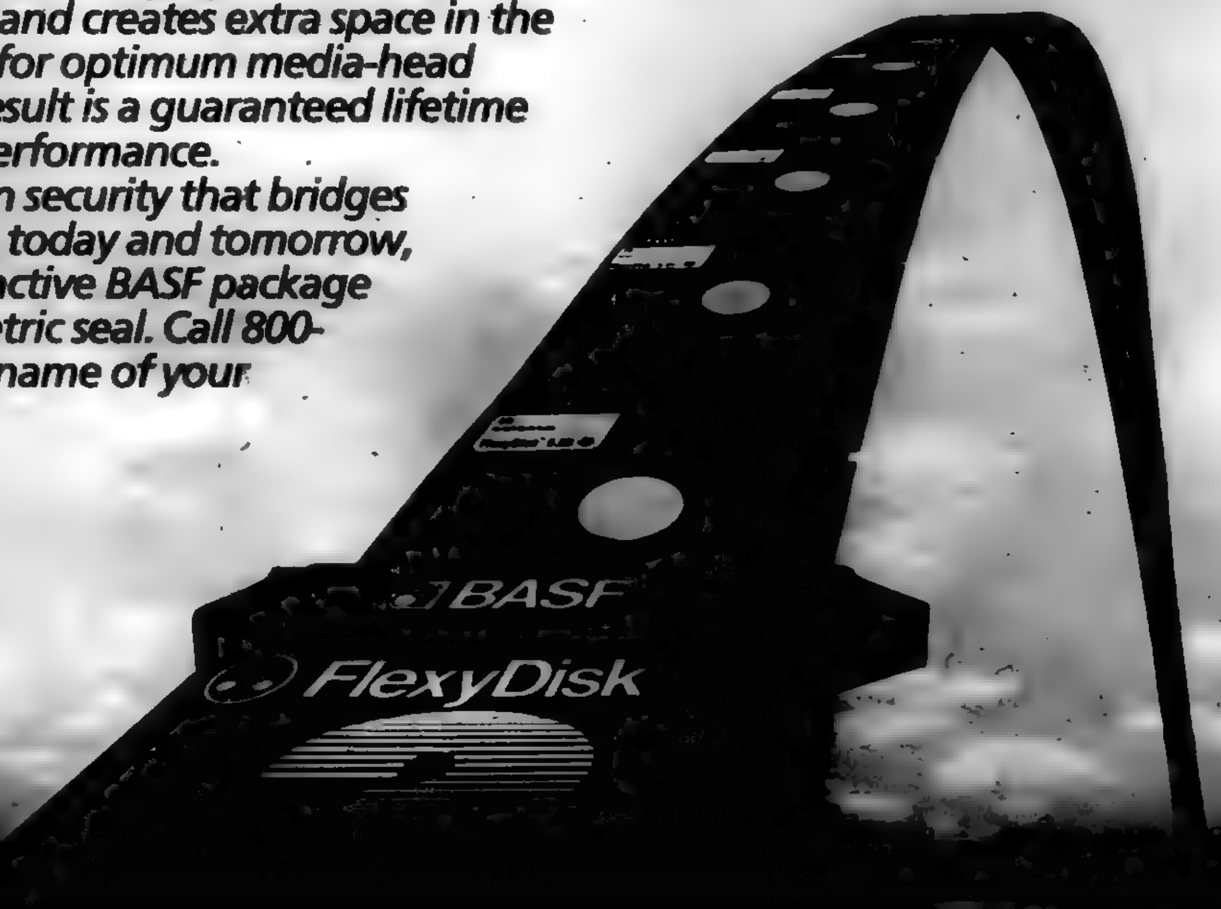
BASF QUALIMETRIC™ FLEXYDISKS® A GUARANTEED LIFETIME OF OUTSTANDING PERFORMANCE.

BASF Qualimetric FlexyDisks feature a unique lifetime warranty, firm assurance that the vital information you enter on BASF FlexyDisks today will be secure and unchanged tomorrow. Key to this extraordinary warranted performance is the BASF Qualimetric standard...a totally new set of criteria against which all other magnetic media will be judged.*

You can count on BASF FlexyDisks because the Qualimetric standard reflects a continuing BASF commitment to perfection in magnetic media. One example is the unique two-piece liner in our FlexyDisk jacket. This BASF feature traps damaging debris away from the disk's surface and creates extra space in the head access area for optimum media-head alignment. The result is a guaranteed lifetime of outstanding performance.

For information security that bridges the gap between today and tomorrow, look for the distinctive BASF package with the Qualimetric seal. Call 800-343-4600 for the name of your nearest supplier.



*Contact BASF for warranty details.

Types I and II account for more than half

INTRODUCING THE STANDARD BY WHICH EVERY OTHER PC WILL BE MEASURED:

THE DATA GENERAL/One™ PORTABLE.

Fits in a briefcase.

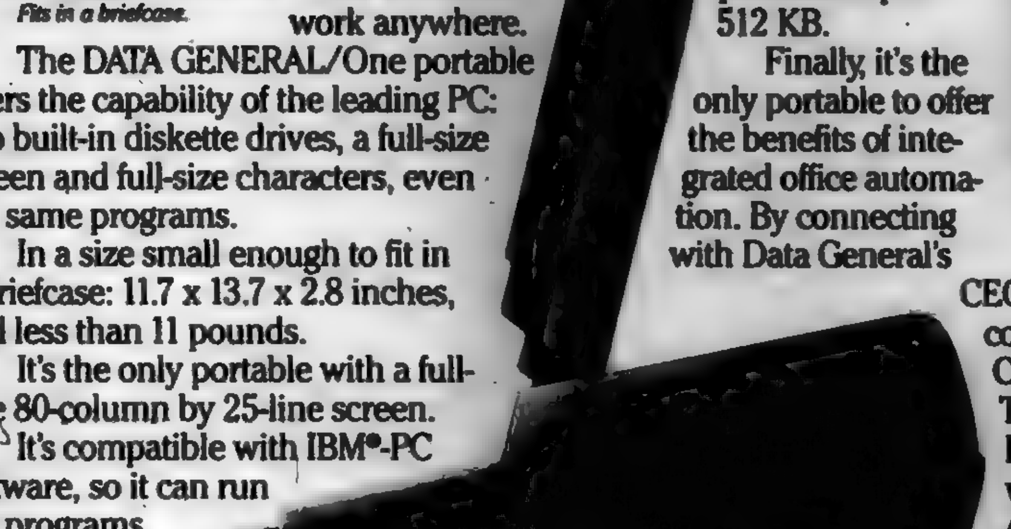
Free your people from the confinement of their deskbound computers, with the first full-function business system that lets them work anywhere.

The DATA GENERAL/One portable offers the capability of the leading PC: two built-in diskette drives, a full-size screen and full-size characters, even the same programs.

In a size small enough to fit in a briefcase: 11.7 x 13.7 x 2.8 inches, and less than 11 pounds.

It's the only portable with a full-size 80-column by 25-line screen.

It's compatible with IBM®-PC software, so it can run the programs available to PC users. Software like 1-2-3™ and Symphony™ from Lotus,™ Wordstar,® dBase II,® Multiplan,® even engineering packages like Golden Common LISP,™ and Bellesoft ES/P™-Ada.®



It has two built-in diskette drives and runs thousands of IBM-PC programs.

It's the only portable with two built-in 720 KB diskette drives, giving it twice the storage capacity of the leading PC. And memory is expandable up to 512 KB.

Finally, it's the only portable to offer the benefits of integrated office automation. By connecting with Data General's CEO® system, users can convert MS™-DOS files to CEO files and vice versa.

Connects with Data General's CEO office automation system.

The DATA GENERAL/One. It gives your people what the leading PC does. And something the leading PC doesn't.

Their freedom.

Find out more about the DATA GENERAL/One portable by contacting your Data General salesperson or nearest authorized dealer.

Call 1-800-DATAGEN.

Data General
a Generation ahead.

How to avoid this Lotus position.

Everybody knows that Lotus 1-2-3™ is the best selling business software ever developed. And for good reason. Still, learning to use the full power of 1-2-3—not to mention getting up and running on any particular application—is often a tedious, time-consuming proposition.

That's why we created OptionWare. OptionWare provides templates which require no working knowledge of Lotus 1-2-3. Just load Lotus 1-2-3 and an OptionWare template and use five keystrokes to put the power of 1-2-3 to work on your specific job.

OptionWare is a library of over 50 specific business applications covering: Financial, Sales & Marketing, Organizational, Managerial, and many more categories. And, because they all operate exactly the same way—using the same five keys—once you've mastered one, you've mastered them all.

Demo Disk Dollar Giveaway

We believe a demonstration of OptionWare is well worth your time. To prove it, we're giving away $500 in cash to anyone with one of our winning demo disks. Watch for the OptionWare representative handing out disks at COMDEX. Bring yours to Booth #310 in the Main Hall to see if you've won. With 1-2-3 add-on sales and $500 in cash, you can't lose with OptionWare.

THE EXECUTIVE DECISION MAKER

By Louis Boyle

A new breed of user is emerging in the microcomputer world: the senior executive who finds the micro a strategic tool that gives him powerful leverage in manipulating information. Not only are micros used on behalf of these executives, but more and more top managers are putting micros to work themselves.

Especially at the senior levels, managers often search for information while drowning in data. A good microcomputer-based decision support system, whether simple or sophisticated, helps them sort the wheat from the chaff.

The most common decision support software is spreadsheet packages. More often than not, data is re-entered into the micro from its original source as opposed to being downloaded — although the more sophisticated uses involve completely automated extraction from a mainframe data base, some reformatting and summarizing, then downloading to the micro. In either case, only rarely does the executive become involved in making the data accessible; he has neither the time nor inclination.

The Microcomputer Consulting Group at Arthur Andersen & Co. recently commissioned a survey to discover how executives felt about personal computing. The survey covered 151 large organizations (annual sales averaging $133 million) and 157 small ones (sales from $1 million to $10 million). It zeroed in on executives who played a broad policy role within their organizations.

Although the geographical coverage of the survey was limited to the Southwest, further research across the rest of the U.S. and Canada confirms the general trends reported.

The overall results are unequivocal: The micro has gained widespread acceptance by decision makers in all the major business sectors: manufacturing, wholesale trade, retail, insurance, health and social services, transportation, government, construction, finance, utilities and communications.

Micros are very conspicuous, used in 57% of companies overall and 73% of the large companies. Significantly, roughly one in three executives has a micro on his desk; 23% have one at home as well.

An overwhelming 93% stated their micro's performance is meeting or exceeding expectations.

Again, the major application (in 59% of the large companies surveyed) is decision support: providing an information and analysis infrastructure that supports much more informed decisions. This area covers budgeting, finances, what-if analyses of all types and general accounting (especially in smaller organizations).

The other main uses are word processing (45%) and operations control (inventory, distribution, production, labor, 27%).

The primary area of concern was to get a system that responded specifically to the user's anticipated needs; additional concerns relate to education to ensure proper acceptance and usage of the micros. Compatibility with existing systems (hardware connectability, ability to move data between the micro and the mainframe, interfacing to internal and external data bases) is also a significant issue.

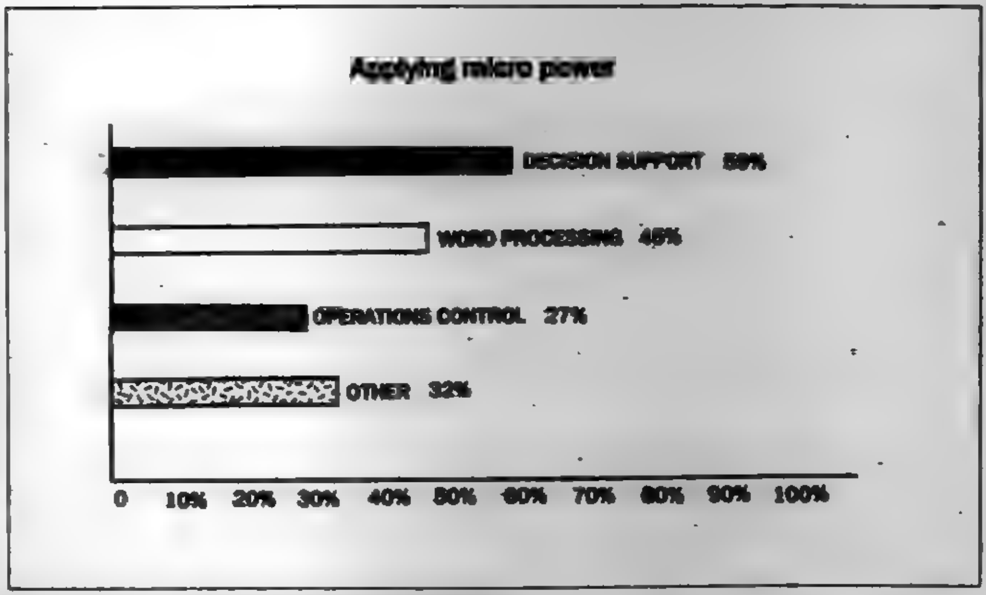
The decision-making process depends more and more upon an integrated view of the business and how it affects, and is affected by, the outside world.

In action

At Arthur Andersen, the majority of the staff uses micros every day. There is one micro for approximately every 10 professionals. Plans call for one on every desk. One of the senior executives using a microcomputer is Vic Millar, who holds worldwide responsibility for planning, defining and integrating Arthur Andersen's three practice area divisions: accounting and audit, management information consulting and tax.

Millar uses the micro to reference individual office and division operating statistics. This system is basically a menu-driven key factor reporting system that presents data in both tabular and graphics format. The system replaces a voluminous series of cumbersome report books and provides a much wider scope of information and deeper levels of detail.

The bottom-level detail data is generated by transaction systems running on the firm's mainframe computers. Information Builders, Inc.'s Focus package is used to extract and summarize the data; then it is downloaded to an IBM Personal Computer with an attached 20M-byte hard disk drive, where Information Builders' PC-Focus is used to build the operational data base.



Percentage of companies using each application.

The micro data base is then transferred to a similar Personal Computer (without the link of hard-copy output devices) in Millar's office.

The data available to him is a series of key operating factors at the division within an office level, as well as consolidations of this data at the office, area, country and region level and across division levels. Actual and budget information on partner profitability, chargeable hours per employee and so on is kept on a monthly, year-to-date, prior year and summary-annual data basis.

Millar uses this data to gain a better understanding of the quantitative side of the practice in his contacts with the offices around the world. He is thus much better equipped to discuss trends and performance (both absolute and relative to peers) at all management levels.

Homework

The chief financial officer of a large transportation company, who has very heavy demands on his time during the day, is becoming accustomed to using a micro by working on one at home.

A basic course, covering Microsoft Corp.'s MS-DOS and Lotus Development Corp.'s 1-2-3, gave him the background he needed to start understanding the ins and outs of the machine. He spent long hours on nights and weekends gaining a basic understanding of the machine's capabilities. He produced graphics, bar charts and spreadsheet analyses for personal budget, financial and tax planning applications, then went on to word processing and simple business applications, such as key operating statistics, sales analysis and so on.

Within a few months, he could set up more sophisticated business applications, using data on his corporation's mainframes that would be downloaded to the micro.

- At the U.S. Navy Headquarters Command Pacific Air Fleet, Zenith Data Systems Corp. micros connected via a Sytek, Inc. broadband local-area network serve as electronic mail terminals among the officers of the command. The entire network is secured for confidential message traffic.
- Daniel Sasson is the Montreal branch manager of Crowntek, one of the largest computer service bureaus in Canada, which recently moved into a line of micro services to provide integrated solutions to its clients. Sasson uses a portable Grid Systems Corp. micro for marketing analyses and follow-up, for tracking prospective customers and for writing internal memos. He is now using the micro's data base, spreadsheet, graphics, word processing and mainframe communications capabilities, as well as a number of application interfaces (data base to word processing, data base to spreadsheet tables and graphics, mainframe downloading to the data base).

Sasson has set up some applications himself: his branch operating budget, status reports (including graphs) to his management, revenue status/tracking by client and salesman, forecasting via historical trend analysis, weekly sales reports by salesman and monthly performance studies of mainframe usage.

Louis Boyle is the director of management information services at Future Electronics, a manufacturing firm in Montreal. He was recently a senior manager in the Montreal office of Arthur Andersen & Co.

PC PLUS

DOS Made Easy

Typing Made Easy

A Screen is worth 1,000 Words.

It can show, tell, teach.

Already, our computer-based training courses have become the corporate standard in many of the largest companies. In fact, the courses are widely acknowledged as the finest interactive, self-teaching, software courses for the IBM PC product line and compatibles. QED has created a new standard in CBT.

■ PC PLUS makes you comfortable with the keyboard and cursor control; it also teaches computing fundamentals, hardware, software, data storage, and applications.

■ DOS Made Easy teaches the commands essential to all versions of DOS for the IBM PC and PCXT, including those needed to use the fixed disk.

■ Typing Made Easy teaches touch-typing. When the largest secretarial school in the country selects this product to teach typing to their students, you know it's the best. PS . . . We have a Dvorak version.

Courses run on any 128 KB IBM PC, XT, compatible, or PCjr (cartridge BASIC, except for Typing Made Easy, with 80-column display for all). Typing Made Easy runs on the PC AT.

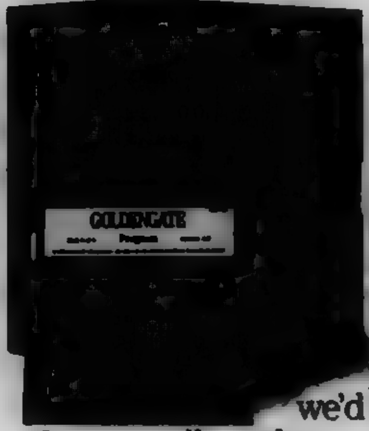
The pc software to use if you have IDMS/R.



At last count, there were more than 50 integrated personal computer software packages.

But for companies with IDMS/R, we'd like to suggest that only one really makes sense.

GOLDENGATE™, Cullinet's pc software package, integrates seven components: database, spreadsheet, graphics, document processing, 3270 terminal emulation, asynchronous communication, and information manager. While the software is exceptional on a standalone basis, it offers an added benefit to pc users in an IDMS/R environment—true micro-to-mainframe integration.

Through the Information Database (IDB), the Cullinet software product that serves as a foundation for corporate information management, a GOLDENGATE user can have direct "transparent" access to all data stored in the IDMS/R database. Indeed, with GOLDENGATE, accessing corporate data is indistinguishable from accessing data on a diskette.

The Complete Software Solution

To find out more about GOLDENGATE, IDB and other components of our complete approach to information management, attend a Cullinet Seminar. To make arrangements, phone, toll-free, 1-800-551-4555.

The pc software to use if you don't have IDMS/R.

How does GOLDENGATE™ stack up against the more than 50 competitive integrated pc software packages on the market today?

With all due respect to those other packages, we'd like to suggest that it stacks up best.

GOLDENGATE's superior functionality results from its unique architecture. Each function in the program is designed to provide an optimum working environment. And each is linked to the others through core software.

The result is a functionally rich integrated pc package for business professionals. GOLDENGATE integrates spreadsheet, database, word processing, graphics and telecommunications capabilities. For use with databases other than IDMS/R, GOLDENGATE has a unique capability in combination with a standalone version of the Information Database (IDB) from Cullinet, a remarkable ability to effect effortless micro-to-mainframe integration. Integration so direct and transparent it allows the user immediate access to corporate data as needed.

GOLDENGATE, the integrated software that works better, because each of its components work better.

To find out more, we encourage you to attend a Cullinet Seminar. To make arrangements, phone, toll-free, 1-800-551-4555.

Cullinet

We understand business better than any software company in business.

THE EXECUTIVE PALETTE

By Alan Paller

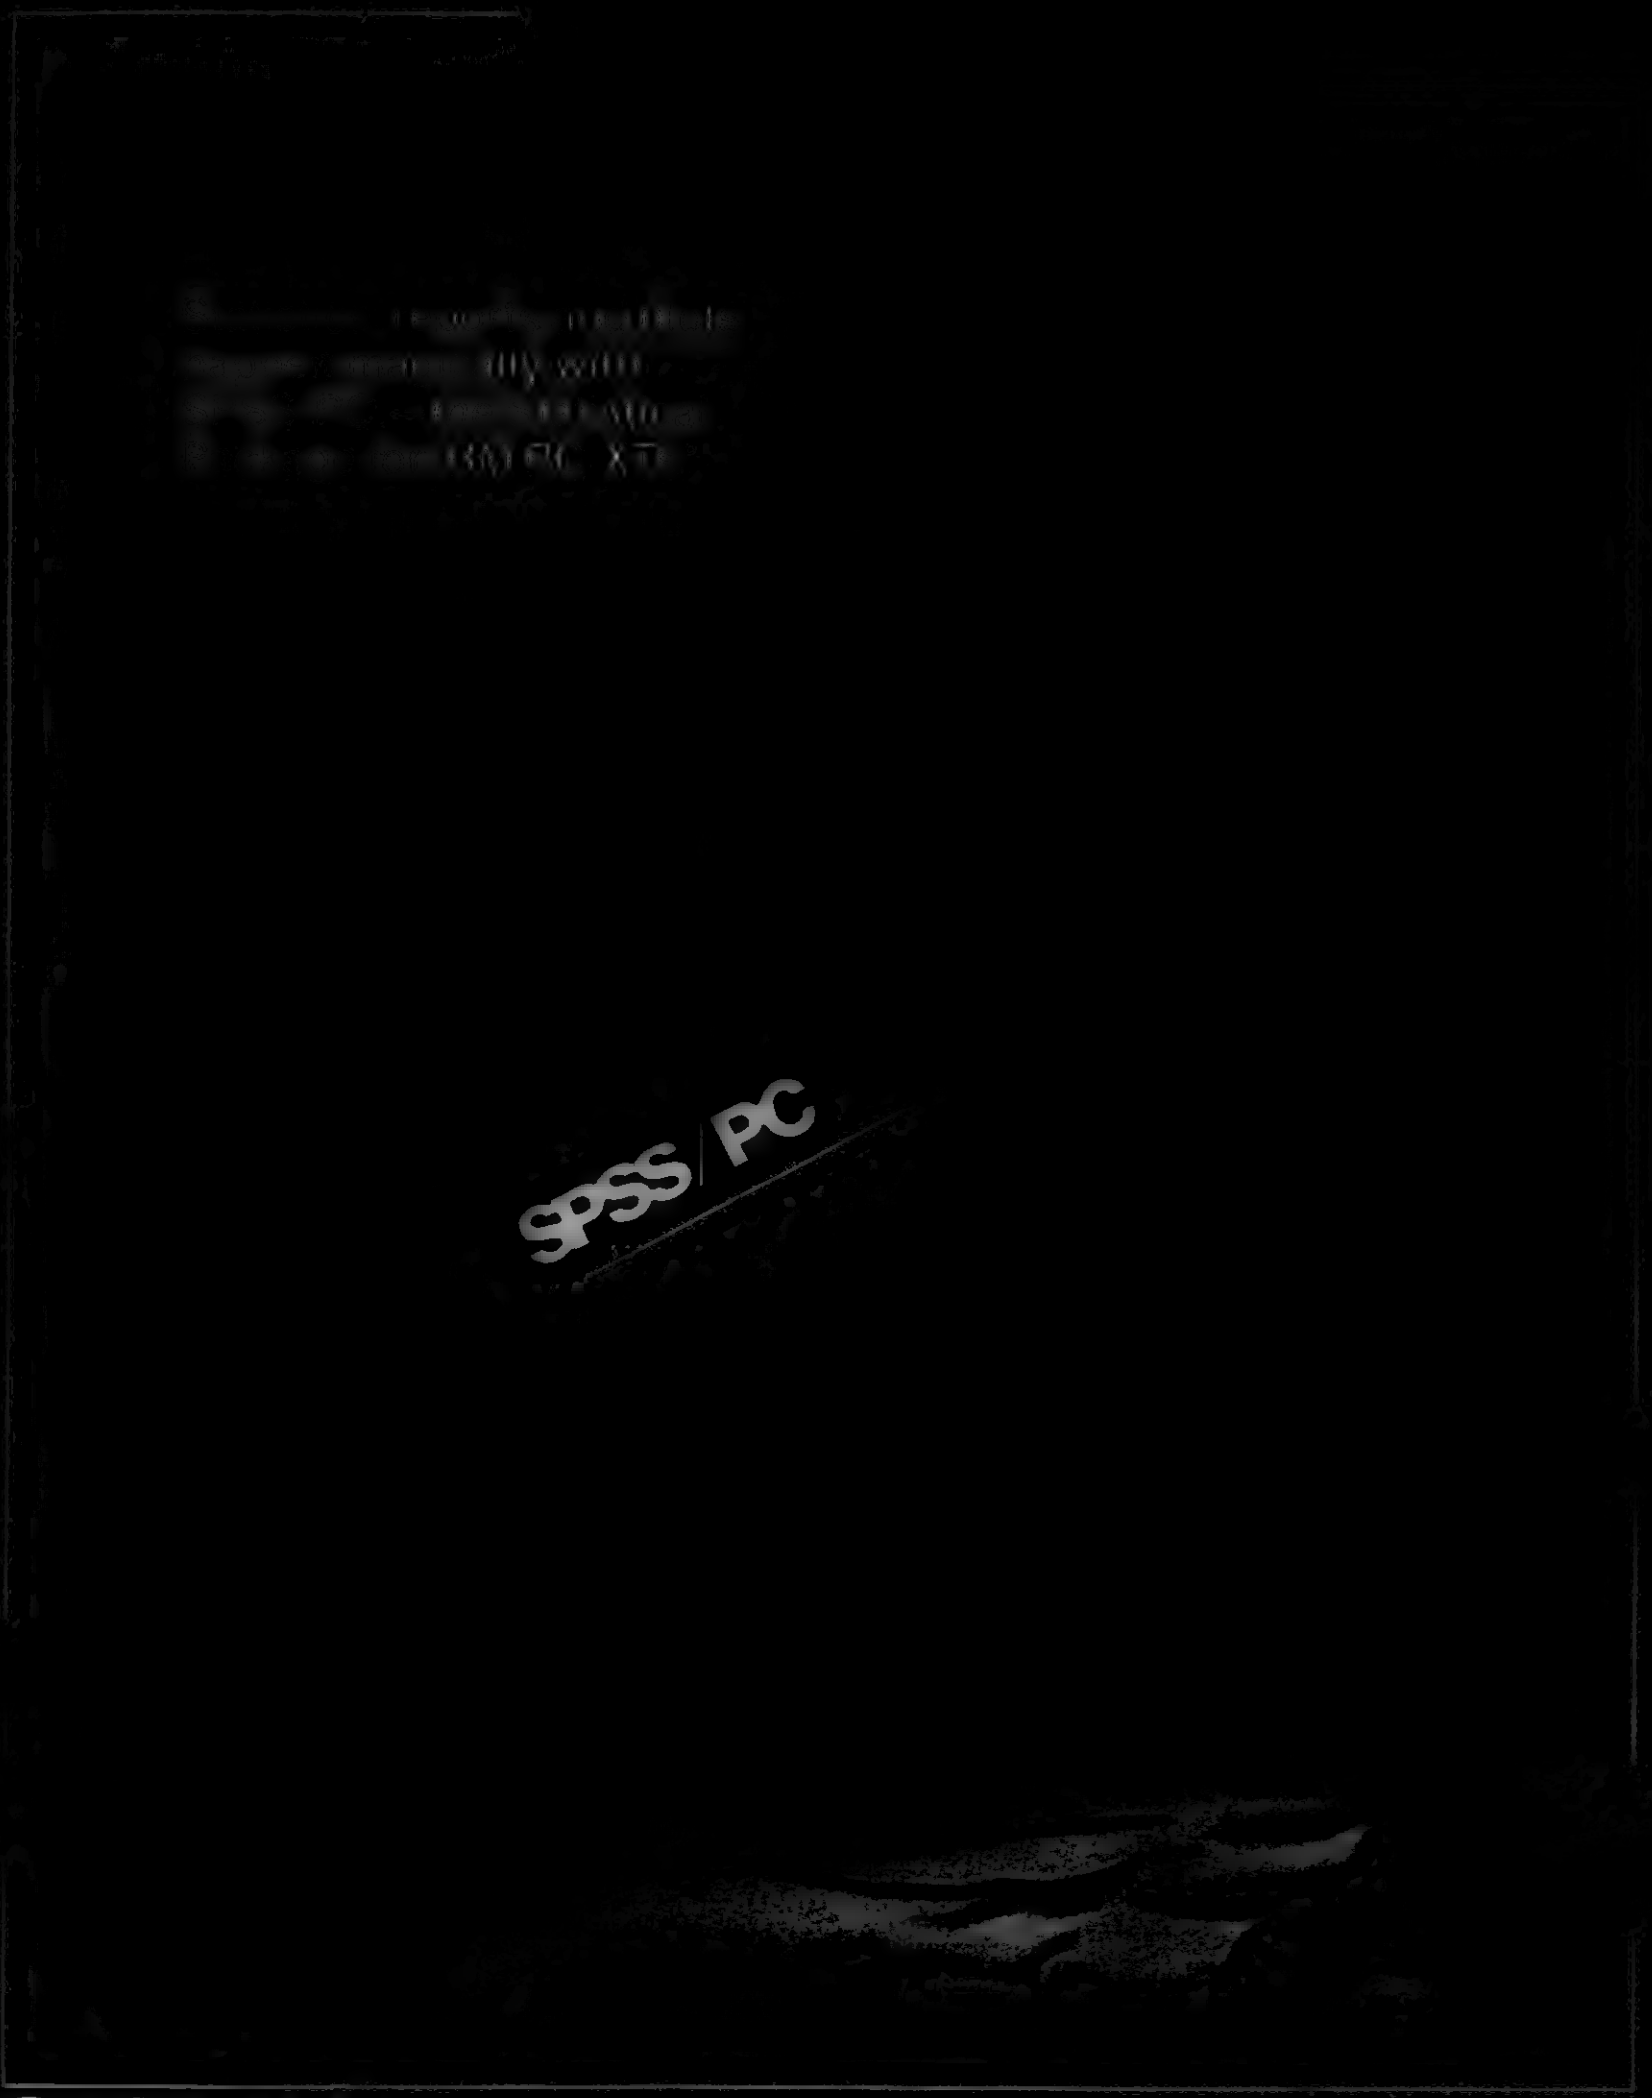
Is business graphics just the executive's Atari? For some middle- and senior-level executives, yes: Graphics happened to come with the computer package and occasionally generates a pretty chart.

But with the spread of micros and computer literacy, business graphics is moving rapidly out of the toy store and into the executive suite.

The use of computer graphics to manipulate business data into more readily understandable forms for decision making and to produce high-quality presentations is only now gaining the widespread acceptance it deserves. It is clearly one of the most dynamic sectors of the computer graphics industry.

When computer graphics appeared on the scene in the late '60s, it was used primarily to analyze data and convert it into charts for easier communication. Because the resolution was low and the graphics were of poor quality, primary applications were internal. Company analysts cared little whether the charts they studied were pretty, as long as they helped them understand the data they needed to study. Similarly, management didn't look for brilliant color in charts. Managers looked for indicators of developing problems, missed opportunities or clearer, more useful information formats.

Then in the late '70s, the new generation of hardware could produce graphics of superior quality in a broad selection of colors. At the same time, advances were made in graphics software. All these breakthroughs sparked a revolution and brought about a dramatic increase in the



[illegible] reporting methods
[illegible] ally with
[illegible]
[illegible] IBM PC/XT

SPSS inc. PRODUCTIVITY RAISED TO THE HIGHEST POWER

acceptance of business graphics. Suddenly, computer graphics began appearing in slide presentations for both internal and external audiences. Producers responding to this interest stepped up their research and development efforts and new product introductions, all aimed at providing new, improved and less expensive hardware and software.

Presentation graphics for board meetings, sales promotions, management briefings, reports to stockholders and a variety of other uses accounts for about 45% of the business graphics market. But as effective as this use of business graphics may be, the real payoff for corporations is the ability to access large amounts of data for decision making.

The desktop graphics terminal or personal computer is the key to the success of management graphics.

Presenting this data in a visual format makes it easier to understand and actually helps executives "see" the meaning of the data and respond with better decisions. This use of computer graphics, known as management graphics, is growing even faster than presentation graphics.

Use of computer graphics in business saves both time and money. At Pepsico, Inc., for example, senior finance officers formerly spent five days each month poring over huge printouts. When the company began using computer graphics for financial analysis, that data was presented in 650 slides per reporting period, and management time spent on analysis dropped to one day per month. In addition, the graphics presentation of data enables managers to identify more easily areas of potential cost savings.

The desktop graphics terminal or personal computer is the key to the success of management graphics. Increasing numbers of managers are discovering that a personal computer can be as useful an executive tool as a telephone or a calculator. Personal computers are turning up in large corporations on the desks of senior managers, plant managers, financial controllers, sales managers, quality control managers, customer service directors — the people who make decisions that affect growth and productivity.

Developments in computer graphics hardware and software in the last 18 months have enabled corporations to take a giant step forward in the use of business graphics in decision making. The introduction of the IBM 3270 Personal Computer in 1983 and of the 3270 Personal Computer/G in

Painting a picture of company sales.

PLANNING GRAPHICS?

So dynamic is the growth of business applications of computer graphics that the National Computer Graphics Association (NCGA) will sponsor two conferences in 1985 emphasizing business graphics — one in Los Angeles June 25-27, and one in Boston Aug. 13-15. Educational sessions will cover the many facets of business graphics, including management and presentation graphics. Introductory sessions will help companies that are moving into the use of computer graphics. The exhibits planned for each event will enable participants to get hands-on experience with the best equipment available.

The NCGA is located at 8401 Arlington Blvd., Fairfax, Va. 22031.

Your micros need never stand alone again.

With FTP from OBS.

OBS FTP is a two-part program that transfers binary and text files between IBM mainframes and a variety of micros. By installing FTP at both host and micro, a 16 bit Cyclic Redundancy Check (CRC) is used to guarantee file integrity at any line speed or line quality.

Easy to use
One menu does it all
Simplicity to please any user is delivered with the diskette. An easily customized LOGON script is provided for PC users. FTP follows this script to automatically dial and log on to the host system. All the user does is type PCFTP in response to the DOS prompt. Following autodial and autologon, the following menu appears:

The user types in three fields of information and presses F1. The file is then transmitted.

Either before or after transmission, users can ask for help, display directories, toggle between the host system editor and the FTP menu, display and alter file attribute settings selected by FTP, list a PC file, or exit to DOS.

Function key driven
Press a key, ship a file. Or get help. Or display directories. Or select any FTP function with a single stroke. Classic simplicity.

Fast.
Transmission speeds can be from 110 to 9600 baud, limited only by the hardware. 1K byte packets are used rather than individual records or lines. Blanks are compressed to further speed the process.

Flexibility at no extra cost.
FTP automatically decides on text or binary transfer and the attributes to use for the transmitted file. Decisions are based on the file names typed by the user. Pressing F6 displays the following screen

(A similar screen is used for CMS filetypes):

To override FTP's decision, just move the cursor to the desired file type.

It really does work!
If you allow users to dial your host, FTP will work for you. We'll even send you a diskette to prove it (You'll dial the OBS mainframe). Drop us a line or send us a business card. Or give us a call if you're in a hurry.

OBS Software
115 Sansome Street
San Francisco, CA 94104
(415) 391-9555

the spring of 1984 heralded the age of business graphics as a management tool. The systems can deliver information directly to the executive's screen, quickly and in a graphics format that makes the data easy to understand.

The concurrent development of higher quality, lower cost output devices has increased the potential even more. Laser printers that hit the market this past summer can produce high-quality charts and graphics. Film recorders can convert data into presentation-quality slides. The cost of this hardware has plummeted from $40,000 to $10,000 and may be $5,000 by year end. In many cases, these devices can be connected to the mainframe so that every terminal within the corporation has access to high-quality slides and crisp black-and-white prints.

> Chevrolet's graphics system saves a full week in the research and development cycle. Charts are ready for review one day after tests are run.

Easy accessibility to high-quality, low-cost graphics is changing the way companies do business. For example, when Monsanto Co. attached a film recorder to its corporate mainframe, managers quickly learned the value of computer graphics in information sharing. In the first two weeks, requests for graphics in 35mm format went from none to 25. In the second two weeks, they increased to 75, and at the end of three months, slide requests averaged 750 per week. All this happened before the company made any formal announcement of the equipment's availability to staff.

Use of computer graphics can dramatically reduce the time elapsed between gathering data and receiving analysis of that data. At Chevrolet Motor Division of General Motors Corp., for example, track tests of new car models are run every Tuesday. The tests generate thousands of pieces of data.

Before Chevrolet had a graphics system to chart this data, graphics technicians converted the data to charts by hand. The test results were ready for review on Wednesday of the following week. Since the graphics system has been installed, the charts are ready for review the day after the tests are run — saving a full week in the research and development cycle.

Better decisions

Computer graphics systems not only save time in arriving at decisions, but they can also help executives make better decisions. Dow Chemical Co. buys petroleum on the spot market. The decision whether to accept an offer is highly complex and requires consensus of three corporate officials in Houston, New Orleans and Midland, Mich. With computer graphics, Dow can send the analytical data in chart format to screens at all three sites so that the decision makers can view it simultaneously. In the 60 minutes they have to make their final decision, they can quickly study the data and arrive at a consensus by phone. Tens of millions of dollars depend on their making good decisions. The graphics system allows instant access to the best data available upon which to base those decisions.

But the revolution in the use of business graphics as a management tool is just beginning. Because the IBM 3270 and the 3270-PC/G are terminals as well as personal computers, they can give an executive direct access to data on the corporate mainframe. While systems of the past enabled executives to keep track of corporate activity in specific areas, the new hardware and software offer the potential to create much larger visual data bases.

Some of today's business graphics software provides on-line visual access to that data. Rather than having to rely on analysts to create visual systems, executives can call up the data they need to make a decision, project growth, analyze the market and evaluate sales — all at the touch of a button.

Growth in development of business graphics systems should top 40% per year through this decade, with mainframe and microcomputer software the fastest growing segments. Better software and lower cost hardware will put computer graphics within the reach of greater numbers of executives, even those in relatively small businesses.

Business graphics is a dynamic market. Advances by manufacturers of hardware and software warrant attention. But the real action is taking place in the executive suite, where business graphics is helping executives make better decisions to the profit of their companies. Their innovative applications are a driving force in the development of this vital industry.

Alan Paller is president of AUI Data Graphics, a subsidiary of Integrated Systems Corp. in Arlington, Va. A board member of the National Computer Graphics Association, he will chair its conference on business graphics next year.

Micro Software on Minicomputers?

Yes. 415-841-9594

We can put your VAX, PDP-11, HP-3000, Eclipse or Nova to work running more software at more terminals than anyone.

We do it with The Bridge,™ a hardware/software add-on board that does remarkable things. The Bridge makes any system terminal (even dumb terminals) work like a virtual microcomputer.

You get to run the hottest micro software while keeping all the advantages of your minicomputer (speed, database, storage, etc.).

The Bridge expands your system in an orderly way, without overloading the host. It's a lot better than buying a bunch of microcomputers and trying to tie them together.

(It's also a lot cheaper.)

Virtual Microsystems is a crack outfit of hardware designers, software writers, systems consultants, and helpful support people located in Berkeley, California. We even have a salesman.

Ask for Dan.

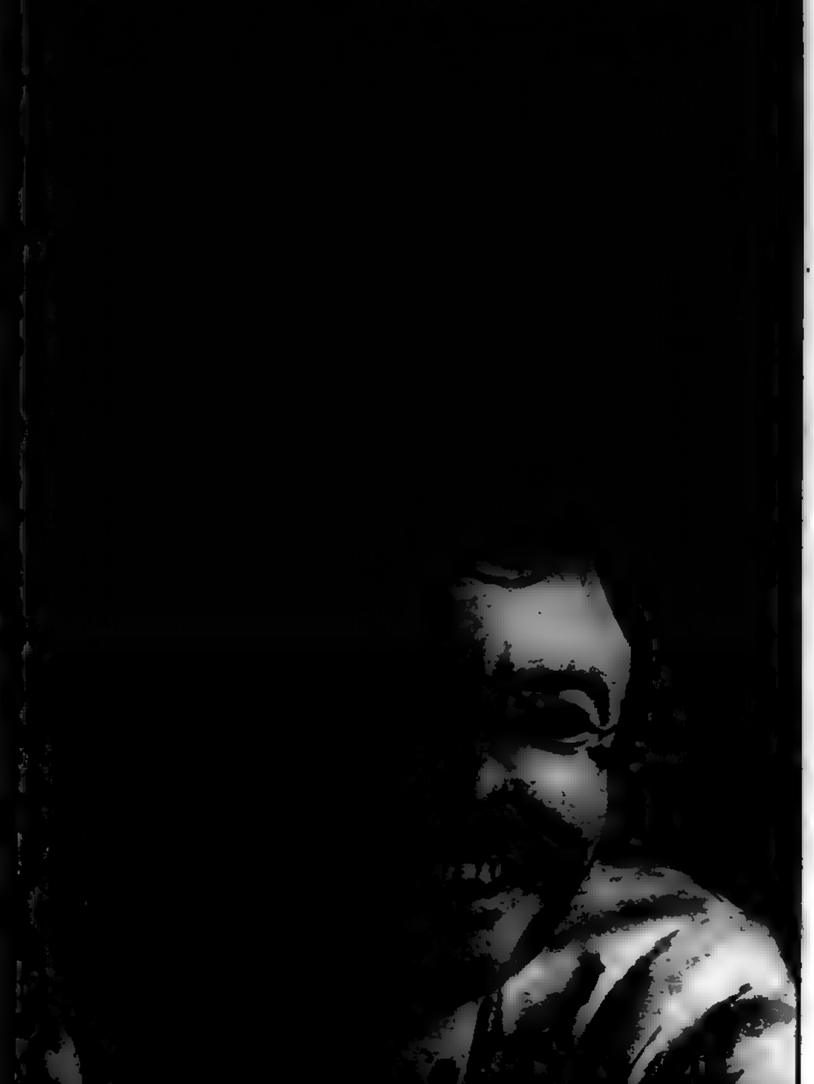
Promoting programmers as record companies promote their performers is an interesting idea. How do you equate the two?



MICHAEL MEYER

[illegible]dele Goldberg has worked for the past 11 years at the Xerox Palo Alto Research Center, where she helped develop Smalltalk.

What are some of the issues that drive your work as a researcher?

Goldberg: The world is always changing and will continue to change. In order to keep up with and understand these changes, we must have tools that can help us get the information we need. Having access to information is the key to individual power; no matter how complicated the world.

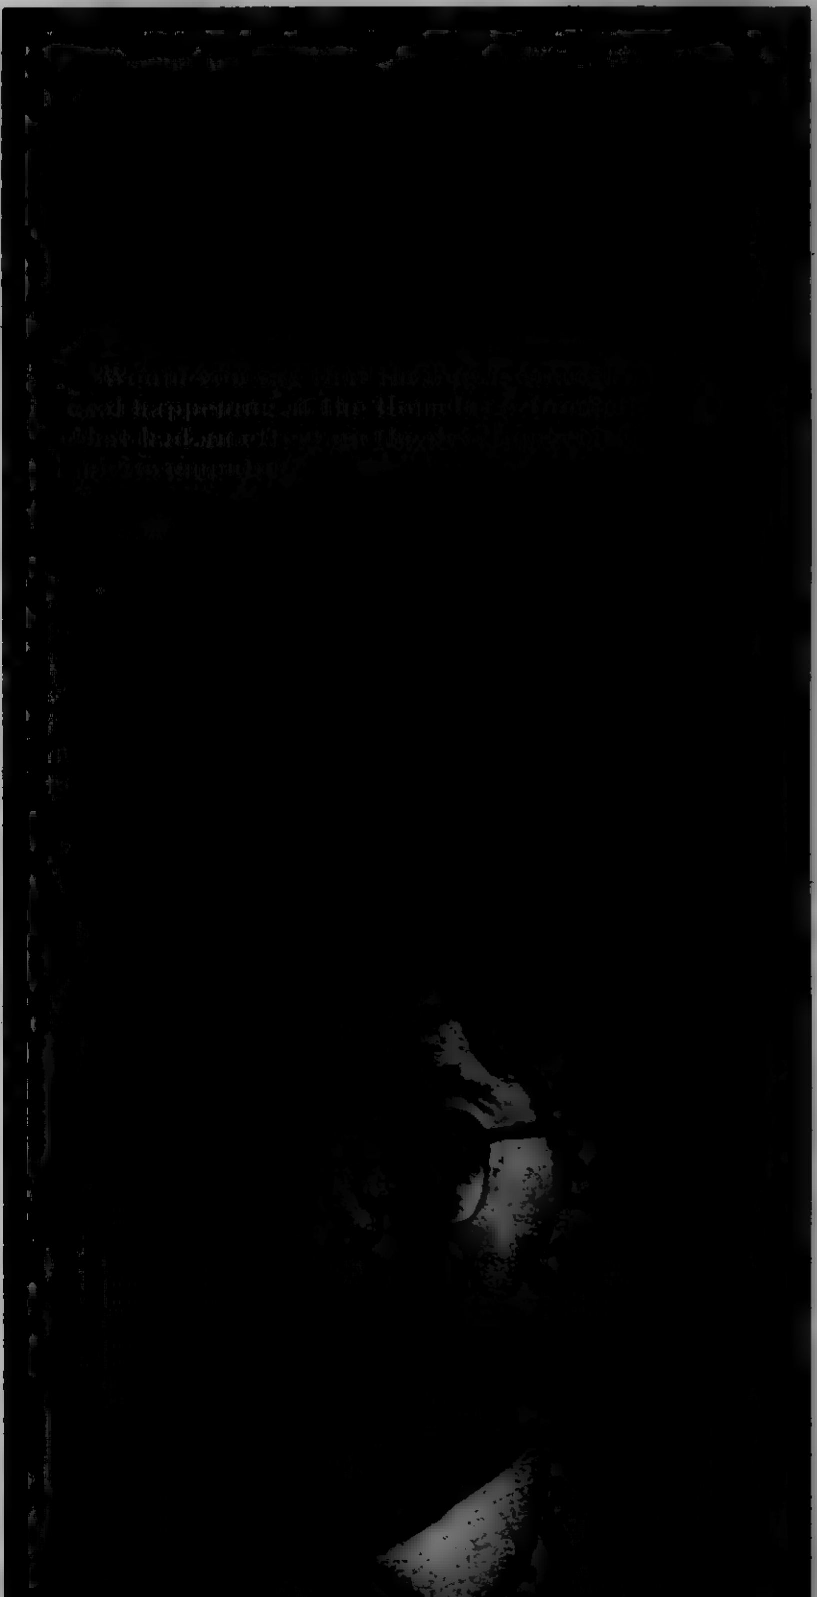
(Continued on Page 18)

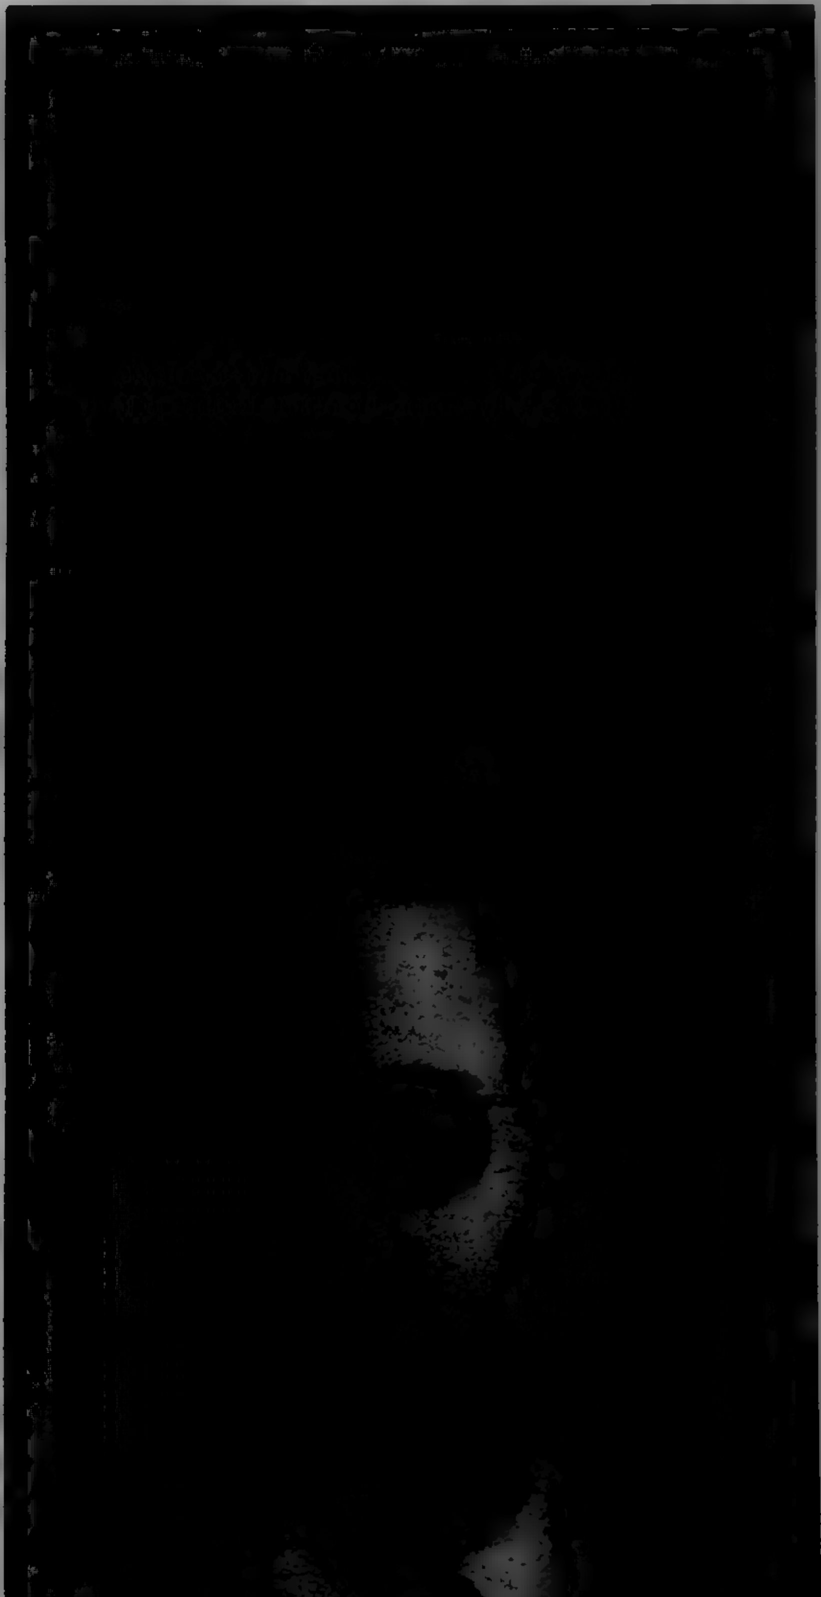
40

They helped launch the industry — four people under 40 years old who profoundly affected how microcomputers are used and marketed.

Priscilla Burgess, a Stanford, Calif., writer, interviewed the four about the rapid growth of the industry, their particular contributions to it and the direction of microcomputer technology.

Each one represents a different facet of the industry: Trip Hawkins was responsible for marketing Apple Computer, Inc.'s Apple II and, in doing so, defined how micros are sold and serviced. Adele Goldberg was part of the team that created Smalltalk, which inspired Apple's Macintosh and influenced the use of icons and windows today. Steve Leininger developed Tandy Corp.'s TRS-80 Model I, one of the first micros on the market. Dan Bricklin created Visi Calc, giving business people a reason to use micros — and incidentally, launched the market for "Visi Clones."





HAWKINS

(Continued from Page 14)

them themselves. We try to give programmers the credit for their products that they deserve.

The philosophy I base this on is that the computer is a new medium of communication, much like film, television, audio or book publishing. It happens to be a pretty impressive medium, and it's a creative medium. The best work is done by people with real creative talent who are able to exploit the power of the computer. These creative people feel the same way about their work as artists in other media do.

So you are not developing software yourself, but finding people who already have products that you think are marketable?

Hawkins: Actually, we have a very flexible approach to where the next great product will come from. Sometimes we come up with an idea and produce it, and other times we will market software that has already been developed.

One of the things we have learned is that software is not really a publishing business. In the book industry, there is very little value added in the creative process. When the writer has finished writing, the publishing company simply makes sure there are no typographical errors, prints up thousands of copies and it's done.

When you are dealing with software, it is much more difficult getting to where you want to go. You may have a terrific idea, but producing the software requires a lot of knowledge about design, computers and the user interface.

How did you happen to be at Apple at such a crucial time?

Hawkins: While I was getting my MBA at Stanford, I did market research on the computer industry in Silicon Valley. When my last study was published, I had correctly forecast that Radio Shack would be the industry leader in 1978. The people at Apple were upset and called me to complain. In the course of the conversation, I mentioned I was looking for a job. Apple was a very high-quality operation with very bright people, and I felt that they were the kind of people I wanted to work with.

Where was Apple in terms of its development?

Hawkins: It was just before they started to sell disk drives, which changed it from being limited to a hobby business to a business with a lot of other possibilities.

What do you feel your contribution to Apple's marketing effort was?

Hawkins: The first thing I was assigned to do was to find out what people were doing with Apples. After a lot of research, we came to the opinion that we could sell the Apple II to the business world if we developed a more powerful machine. So, in 1978, Steve Jobs and I wrote the first proposal for Lisa, as an inexpensive, office desktop product.

Most people thought that small businesses would buy them for accounting applications, but I argued that there were a lot more desktops out there than there were small businesses. And accounting is a complex application that is not that well understood by the businessmen themselves.

What kind of use did you envision?

Hawkins: Word processing was the primary element. I identified the second application as a formatter calculator for financial planning and tables. I was essentially describing [Software Arts, Inc.'s] Visi Calc.

In our original proposal for the Lisa, we wanted it to come out at a retail price of $2,000. Of course, by the time the engineers got through with it, it cost a lot more than that. But now with the Macintosh, the price is closer to what we wanted it to be.

For the next year, I drew up the business plan to get the Apple II into the business market. That involved developing a plan of attack and signing up software products for the Apple II. That is when I started my career as a software talent scout. We got a retail store inventory package, an accounting system, Apple Writer, and I provided support and the operating system for the first version of Visi Calc. In the summer of 1979, we launched the first field training program to promote the software.

What are some of your other contributions?

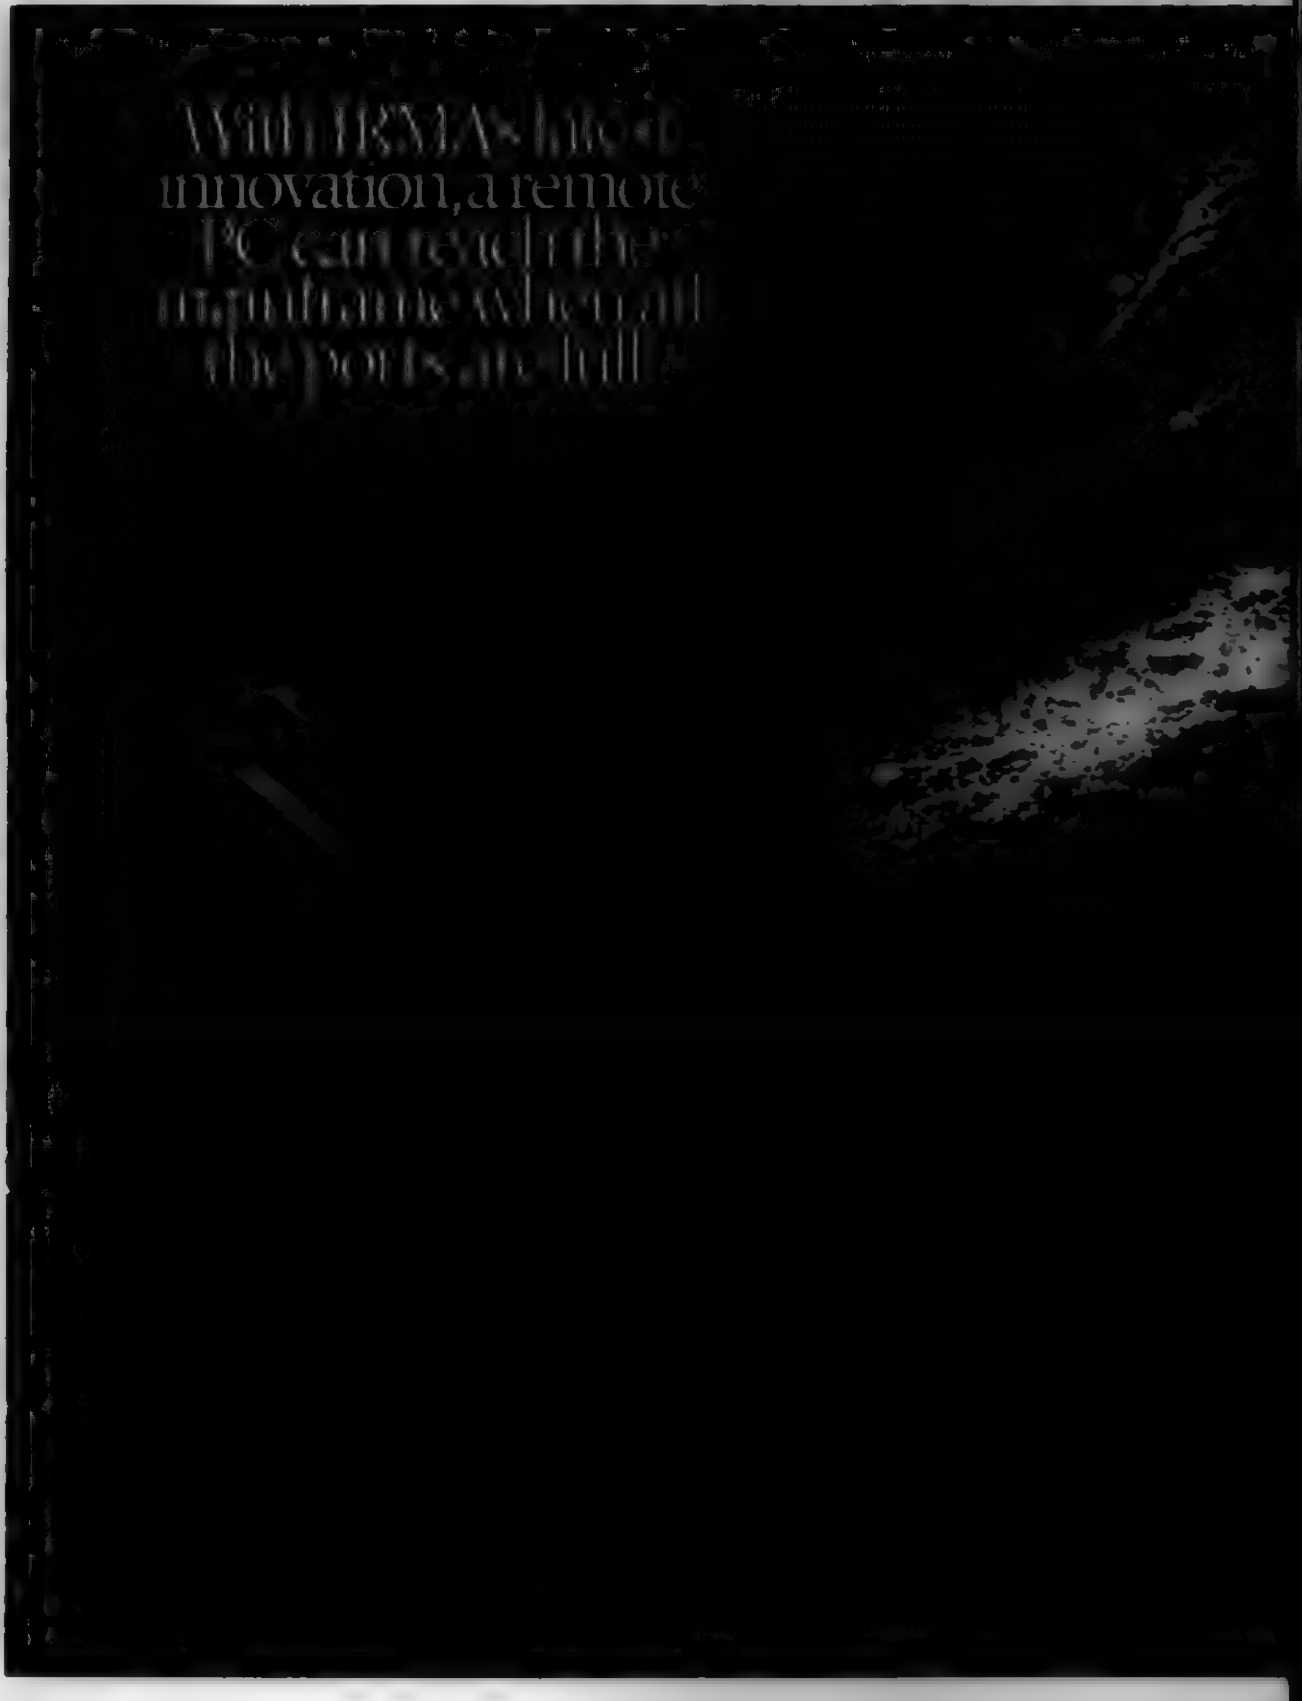
Hawkins: The idea of a walk-in retail computer service, so that people could bring their computers in to be fixed rather than sending a repairman out to the customer's location. This approach was imitated by the entire industry.

Another thing we pioneered was the idea of having an 800 telephone number for toll-free support for software products. That was my idea, and it worked really well. Seminar selling was another idea that brought down the cost of selling the computers to people in the business world.

Then I became the product manager for Lisa. At that point, it was a disaster. It looked nothing like what it is today.

Was that the result of your initial proposal?

Hawkins: No. While I was off working on the Apple II, engineering went off and completely redesigned it. I identified some of the problems and some better directions at the time when Steve had visited Xerox [Palo Alto Research Center] and seen Smalltalk. He took six of us back up, after which we incorporated a lot of the ideas into the Lisa.



With IRMA's latest innovation, a remote PC can reach the mainframe when all the ports are full.

Unfortunately, the Lisa ended up coming out very late and was very expensive.

Hawkins: But they sold about $100 million in the first year, so everything is relative. From an engineering standpoint, it was two years late, because it was started well before the IBM Personal Computer, and Lisa was scheduled to come out before it. By the time the Personal Computer came out, it was much too late to change anything. If I had still been there, I would never have let them go out the door with the price they did. The high price, the IBM Personal Computer and the fact that Lotus [Development Corp.'s] 1-2-3 was just around the corner really hurt the Lisa.

For which computers is your company designing software?

Hawkins: Our strength is really in the home machines like the Commodore [Business Machines, Inc.] 64, the Apple II family, the Atari family, the Macintosh and the IBM Personal Computer. We are going to become the No. 1 supplier for the new Commodore machine — Commodore has acquired a company called Amiga. We are very excited about that machine. It's exactly the kind of computer I started Electronic Arts to make software for.

What are your general impressions of the market today? What do you think about the turmoil?

Hawkins: On the business side, the market has gone through a very simple stepping-stone process. It started with the Apple II and Visi Calc. Then the IBM Personal Computer and Lotus 1-2-3 came out and provided better tools. The Personal Computer has taken over the dominant role in the corporate market.

The retailers have always had a hot item to sell over the past four or five years and haven't really stretched out in new areas. They haven't learned to sell to new markets effectively, so this year that market has slowed down a bit. There haven't been as many people out to buy spreadsheets, and a lot of retailers have been losing money.

On the consumer side, video games took off without anyone understanding why. It was a fad. The machines had no growth path; and the games were not that interesting. At the same time that was happening, the really inexpensive computers came out promoted by ads that tried to make parents feel guilty. Pretty soon they realized that the computers didn't do anything. So now you have disillusioned retailers who have been burned on video game inventories and then on cheap computers.

There has been a shake-up in the software business as well. There had been a very carefree attitude on the part of the manufacturers, so much of the software was filled with problems. The consumer is demanding a better quality product, and a lot of the companies that produced shoddy goods are going away.

I think that this year the home computer industry is going to be no bigger than it was last year. At Christmas, there will probably be $60 million spent by the home computer companies to talk about good products.

A lot of consumers are going to discover what home computing really can be for the first time.

The computer is the medium of doing, which sets it apart from other media such as TV.

What do you think home computing can be besides word processing?

Hawkins: There are two categories. The first is looking at the computer as an appliance. An appliance is something like a dishwasher; you push a few buttons and you get a result. And if the price of the result is low enough and it saves you time and money, you buy it.

The computer has a revolutionary aspect in that every time I put a new disk in, I can turn it into another appliance.

A program to balance your checkbook or look up recipes really doesn't save you time and money, but other products do. Word processing is a good example.

How do you see the industry developing?

Hawkins: Telecommunications is going to be very important. I think there is going to be a real interest in using the computer as a way to link up with other people.

The computer is a new medium, and it is the medium of doing, which sets it apart from other media like TV. The aspect of interaction is important because it is compelling and involving, and it can offer dynamic feedback instantaneously. For example, the best selling product on the market right now is [Sublogic's] Flight Simulator. It is really exciting to fly an airplane, and to be able to do that on your home computer is fantastic.

Do you feel that the philosophy of your company has had an impact on the industry?

Hawkins: I think it has had an impact, but the impact hasn't been fully felt because there are still a lot of people who have not seen our products.

As long as I can show our products and they say, "I had no idea you could do this with a computer," I know that I'm still a missionary.

It's a sinking feeling indeed.

On the one hand, you have a remote PC which makes a lot of business sense to connect to your big IBM mainframe.

On the other, your 3270 controller doesn't have a single empty port. Which means buying a new controller for one PC. Which doesn't make any kind of business sense at all.

Take courage.

Your ship has just come in.

Introducing new IRMAcom from the people at DCA.

IRMAcom allows any IBM® PC or compatible personal computer to communicate with the mainframe by emulating the function of a 3270 controller.

That's hardware that makes hard business sense. Just like the software you can get with it.

IRMAcom/3270™ and 3270B™ gives your IBM PC the ability to communicate with the mainframe in an SNA/SDLC or BSC network environment.

IRMAcom/RJE™ software allows PC to-mainframe communication in a BSC environment by emulating 2780/3780 Remote Job Entry Workstations.

With the IRMAcom/3770™ software package, IRMAcom will emulate a 3770 Remote Job Entry Workstation in an SNA/SDLC environment.

In all there are four software packages that can be used with IRMAcom. Which gives you the flexibility to choose the right software for the precise job the remote PC is performing.

IRMAcom. From DCA, the makers of the IRMA family of IBM-emulation products.

It makes perfect business sense. And, they're available for immediate shipping.

For more information about IRMAcom or any of the IRMA family of IBM-emulation products, send in the coupon below. Or call 1-800-241-IRMA. Telex 261375 DCAATL.

Mail to DCA, 303 Technology Park, Norcross, GA 30092. And we'll tell you more about IRMAcom and all IRMA products.

GOLDBERG

(Continued from Page 14)

becomes, you can feel you are in charge because you are capable of finding out what is going on.

However, if you create something for yourself that helps you understand your world and it is shared in the business or government marketplace, it will be used in different ways. So you have to make sure that you present it in a way that encourages people to use it the way you hoped they would.

You have to believe that when you come up with something that really helps people, they will use it in a positive way. If you don't believe that, then you can't do research.

In the early days of the microcomputer, people seemed to delight in the thing itself. Now these same people tend to be looking at how micros fit into society.

Goldberg: The focus of personal computing as an individual working with the technology had good qualities to it, but it misled us down a pathway of worrying about the device. Alan Kay said once that as long as the computer dominates your attention, then you don't have something that supports interpersonal communication.

It's people who are interesting: what they know, their comments and opinions.

We do have telephones.

Goldberg: That's right, except that suppose there's one person who knows something you want to know and there are 1,000 other people besides you who want to know that, too. How reasonable is it to occupy that person's time with 1,000 phone calls when the question is always the same?

We are very interested in the nature of the shared information space — I won't call it a data base, because data is the wrong word — that allows a dialogue to be stored and then accessed and used by others. The purpose of a microcomputer is not so individuals can be alone, but so that individuals can have a broader world in which to interact with other people.

It sounds great, but that is not what is happening now.

Goldberg: No, we're not doing it right now, and there is a reason for it. It has to do with what the marketplace can sell. What is being sold? Office tools that will make individuals in offices more productive. Because we are using an electronic device, we think that people should be able to do more faster. There is the illusion that the machine is doing most of the work, while the human is simply monitoring it.

This whole question of productivity is really misguided, because we don't know what we are measuring. We don't understand human expectations and human constraints.

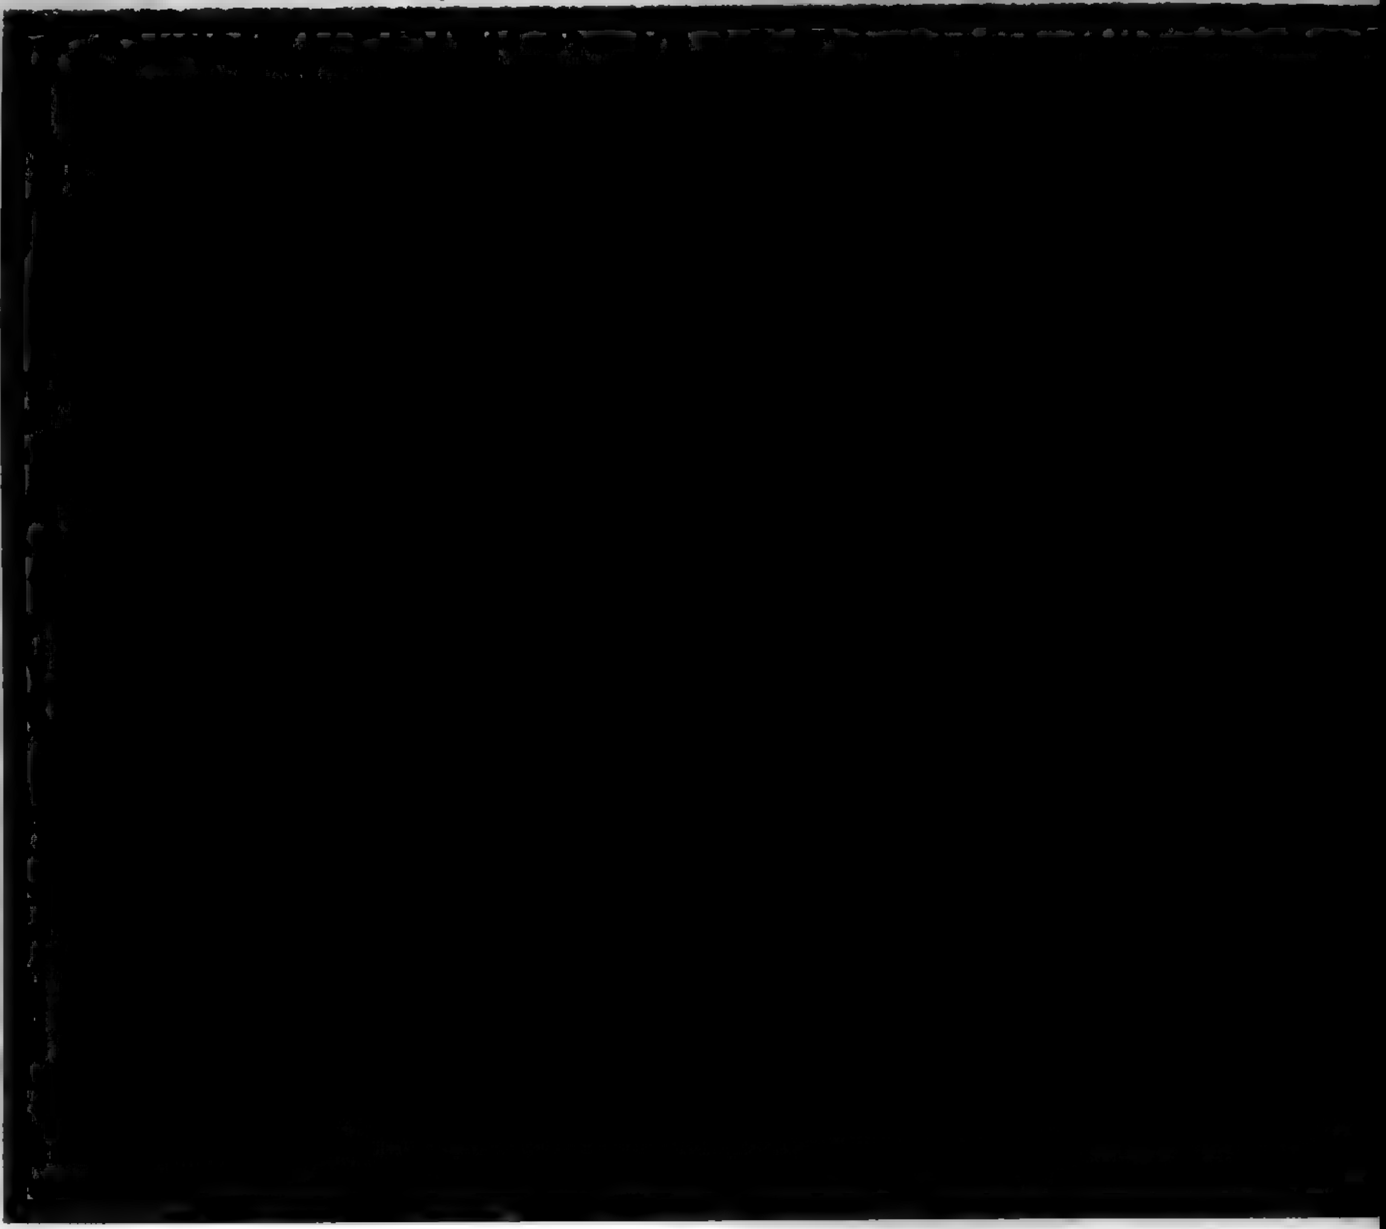
How do you feel about the success of the Macintosh?

Goldberg: A lot of people have asked if I feel badly that Xerox wasn't the one to produce the Macintosh. The answer is yes, of course. All of the elements of the Macintosh were derived directly from research done here. But of course, Xerox did produce the Star for a different marketplace. It does disappoint me that we were not in the market I would like to be in, but I knew that when I joined the company. The point is, Steve Jobs was smart enough to recognize a good idea when we showed it to him — and that's nice, that's a compliment.

But wasn't the point of sharing Smalltalk with the industry to get other manufacturers to use it?

Goldberg: Oh, absolutely. Well, let's see. There are different levels of sharing. When the Star was announced, everyone got to see the level of user interface we had developed, and that was not an issue. The only way we were going to get people working on the hardware was to get the software out there as a different direction for people to think about — not as an end, but as an evolution. In order to encourage an evolution, it takes lots of people competing, sharing and interacting with one another to solve these problems. Our goal was to share the software to get people to help think about the hardware.

What do you think about the way the Macintosh works?



Introducing 3270 PC capability for

When IBM designed the 3270 PC, they thought of everything. Except what to do with all the PCs your company already owns.

We were a little more thoughtful.

Take our CXI 3270 PC Connection. It's an add-in board and software that turns the IBM* PCs and compatibles you have into the 3270 PCs you need. Both local and remote. Using either a coaxial or modem connection.

Now your users can access and "window" up to five different host applications at the same time. There's also a window for running a PC DOS program. Which can be easily programmed to talk with any host session—or all five at once. And if that weren't enough, we even included two electronic notepads.

But here's the best part.

Your existing PC-attached printers can

IBM is a registered trademark of International Business Machines Corp.

Goldberg: You have to spend too much time shuffling those diskettes around. I got beyond the pretty icons right away, since it was all essentially an adaptation of something I had been using for years.

There are microcomputers for different kinds of people having different needs. We don't think that everyone can wear the same dress any more than they can all use the same computer. So one of the things that I think the industry has to move toward is hardware and software "pluggability."

All systems need to be open systems, with modules that can be plugged together in a rational way so that we can have a variety of devices but still have the same functionality.

Your ideas could very well be carried out by IBM alone. There are at least 55 companies making Personal Computer look-alikes, and it could end up being the standard. Yet a lot of people don't think it's such a wonderful machine.

Goldberg: First we have to realize that there will be lots of variations in hardware and software and in the interface among them, either for a long time or forever.

The marketplace and the need to make money drive people to pick certain circles of standards. In the computer industry, there is the philosophy of the open system and the closed system. With the Macintosh, Apple turned its back on open systems, which was one of the things that interested people in Apple and especially the Apple II. You could plug almost anything into it and take it apart.

And what did Apple do with the Macintosh? It went 180 degrees the other way to a completely closed system. And if you wanted to develop applications on it, you would have to use nonstandard languages on Apple's own development system. Within less than a year, Apple had to change its tune on that one. People don't like that. They want to have choices.

The IBM Personal Computer is interesting because IBM simply put out a core system, which was not fascinating, but had a couple of things different enough about it to be attractive. First was the IBM logo — the company that businessmen believe in for service and longevity. The second thing IBM did well was that by coming into the marketplace late, it provided an open system. IBM was not going to do everything, and it invited everyone to join the bandwagon.

We are going to see IBM come out with a Unix system and its own window package, because it is not quite sure what is right, either. So there will be some variety in what the company produces. IBM has always been willing to try something new, but it is a little bit more cautious and conservative.

Afterward, it may shut everybody out, which will make a lot of people and companies mad. One of the things that has always been exciting about the American marketplace is the variety of companies that give you choices. Users may go to IBM because they prefer that choice, but they like the idea of having the choice.

What do you think the next step will be?

Goldberg: The next step is thinking of information in the sense of a library. You have a library in your home, your office, your community, your city and your state. There are levels of libraries and, depending upon how important it is for you to get information, you are willing to pay the cost of following the pathway to get it.

In the same way that we have levels of libraries, we will have levels of networks. One of the hardest problems to think about and understand is that the workstation, the node on the network, is the doorway into getting, using and exchanging information.

When I talk about interpersonal use, I don't think of access but of information exchange. The computer is a door, and through that door one travels on a pathway heading for somewhere else. On the way, one can visit other places — other way stations that offer electronic services that help you in some important way.

There are lots of things that just plain cannot reside in your microcomputer. So not only do you want to travel the pathways to get at stored, static information, like encyclopedias of the world, but also you want to get at the various kinds of information that give you power over your own life.

all the PCs you can't afford to replace.

work as host-addressable IBM 3287 equivalents. You can run all the PC software you've already invested in. And even international keyboard mapping and file transfer are standard.

Of course, not everyone on your network needs full 3270 PC capability. That's why we offer the CXI 3278/79 Plus connection. It lets your PC users view one host session, one PC program and two notepads—concurrently.

Our entire line of CONNECTWARE™ products is available on a 30-day free trial basis.

So for more information, call 800/221-6402. In California, call 415/424-0700. Or write CXI, Inc., 3606 West Bayshore Road, Palo Alto, CA 94303. Telex 821945.

And get the 3270 PC capability you need on the PCs you already have.

LEININGER

(Continued from Page 15)

A lot of us worked in semiconductor houses, and we were aware that one way to reduce costs was to put everything on one board. It was inevitable that someone was going to do it. It wasn't so much a cold, calculating kind of thing as in today's business. It was more like, "Boy, this sure seems like fun." It was a very exciting group of people.

There were three computers that came out about the same time: the Radio Shack Model 1, the Apple II and the Commodore Pet 2001. They came out within two months of each other, and those three machines really set the world on fire. They were all relatively affordable; they all had Basic and ROM [read-only memory]; they all had video electronics built in; and they all used a cassette recorder for data storage. They were all developed independently, but they were surprisingly the same.

We were all at the right place at the right time. Anyone who tells you that wasn't a factor is blowing some smoke. You don't see as many 24-year-olds doing what we did back then. We didn't know any better. We didn't know that you couldn't do it.

After the Model 1, what did you produce?

Leininger: We turned out the Model 2, which was Radio Shack's first real business machine. The Model 3 evolved into the Model 4, which is still being sold. We have a very small engineering staff at Radio Shack, so most of our color computer came from Motorola and the Model 100 from a Japanese company. Since then, my input has been on a grander scale — horizon shots and things like that.

How does the Macintosh compare with your computers?

Leininger: The Macintosh is a great machine — with no software yet. The software issue is getting better, especially now that Apple has the Fat Mac. It was announced with very little fanfare. I found it in a crack in a no-big-deal article somewhere, which is kind of amazing to me. Of course, maybe Apple doesn't want to stir up everyone who's got the 128K ones.

The one thing Apple should get a lot of credit for is the fact that it is going out and plowing its own ground. It's like growing asparagus. It takes three to five years before you can harvest any of it. Apple has been working on the Macintosh since back in the Lisa days.

Apple's done the first brave step in burying the operating system. I applaud the company for that. You are hacking around when you're playing with an operating system.

Now if you really want to give credit, you need to give credit to people like Alan Kay and some of the other people out at Xerox Palo Alto Research Center for actually doing the icon-and-mouse-based interface.

How does it compare with what you are doing?

Leininger: We don't do things to that great a depth. We have a very small staff, and if you consider the number of products we have in the stores that we have designed in-house, it's an astounding number.

So you're not doing much research and development. Do you feel you are dependent upon existing technology?

Leininger: You have to consider that everything in the Apple is existing technology, too, except for perhaps the software. We sometimes buy software technology rather than develop it. Since we are a very high-profit-margin company, we tend to have cash available to purchase things, such as the Model 100.

Do you rework it or take it as is?

Leininger: We put our colors on it, and we had major input into the software. One thing you need to learn in this business is to build on good parts that others have and fix their bad points. In the case of the Macintosh, what Apple is doing is taking the Lisa and making the thing portable.

What do you think of what IBM has been doing with the Personal Computer?

Leininger: To say it's a crummy machine wouldn't give me too much credibility.

Until not so long ago, the mainframe was the hub of the information universe.

Big. Powerful. Intelligent. It was a master of all it surveyed.

But then something happened. Something very alien to the mainframe's way of thinking.

The personal computer was created. And the war of the information worlds was on.

Introducing the Exchange Series from Intelligent Technologies.

From the very beginning, we recognized the benefits of getting micros and mainframes together.

And backed by Logica, a world leader in communications and information systems, we developed a whole series of products that do just that.

Cost-effective and fully-supported, our Exchange Series™ lets IBM® PCs, XTs, PC-compatibles and mainframes work together in harmony.

And lets you solve virtually any micro-to-mainframe requirement you have. In virtually any environment you run.

And it all fits into the system you already own.

Exchange Series products consist of software on diskettes and printed circuit boards. They communicate over voice-grade or leased lines, as well as via coax cable.

So now, PC users company-wide can share, transfer and file the latest on-line corporate information in SNA, async or bisync environments on PCs running under PC-DOS. Or Concurrent™ PC-DOS, which allows windowing and multi-tasking.

In short, they can work a lot faster and a lot smarter than ever before.

What's more, the Exchange Series is easy to upgrade. Additional software lets you add other protocols as you need them. To help keep micros and mainframes—and the people who use them—aligned for years to come.

SNA Exchange™ SNA/SDLC communications; 3274 cluster controller, 3278/9 terminal with multi-sessioning, 3287 printer and 3777-1 RJE workstation emulation. Provides toggling between DOS and 3270 functions, plus the ability to process

We bring wo
without a

[illegible] Associates, Inc., Scottsdale, AZ, Englewood, CO, Albuquerque, NM, Austin, TX, Houston, TX, Richardson, TX, Murray, UT; [illegible] Technology Distributors Inc., Markham, Ontario; [illegible] Sales Associates, Inc., Vernon, CT, Wakefield, MA; [illegible] Electronics, Anaheim, CA, San Jose, CA, Lodi, CA, San Diego, CA; National Product Marketing, Inc., Atlanta, GA; [illegible] Computer Products, Inc., East Syracuse, NY, Rochester, NY, Vestal, NY; [illegible] Drake Electronics, Inc., Portland, OR, Bellevue, WA; SRA, Inc., Arlington Heights, IL, Carmel, IN, Prospect, KY, Maple Grove, MN, Brookfield, WI; Intelligent Technologies Corporate Offices (415) 328-2411, (212) 370-9244.

IBM has a funny place in the market, but it's getting to the point where that market is becoming saturated. People get in trouble when they don't assume that IBM looks at other products and implements good ideas. It does it in a very slow and cumbersome way.

There's no question that an IBM is a computer. There's probably not a whole lot of question that an Apple is a computer. But given a choice between an Apple and an IBM, if you weren't very knowledgeable about the industry, you know IBM makes computers — Apple you're not really sure about.

I think the Macintosh is a great machine, and I think the IBM compatibles business is very, very, very dangerous. If you look at mainframe compatibles, like Memorex [Corp.] or Storage Technology [Corp.], IBM always takes them for a fast sleigh ride. It's like Mr. Toad's wild ride at Disneyland — except that the corners are sharp enough to make you fall out.

What will happen with the microcomputer in the business world?

Leininger: Microcomputers in the business world won't be much different for some time. I'll have to give it 10 years before it finally matures into a full product. It is pretty good now for the specific uses we talked about, but it's going to be like the telephone. You don't get all excited about your telephone anymore, but if you consider the technology behind it, it is pretty impressive. The local-area network stuff is fine, but the beauty of the telephone is that you can call from California and you can talk to me in Texas. It is an incredible tool. And, really, the phone isn't the tool; it is the network that is the tool.

Are microcomputers as useful as they could be?

Leininger: If you do any kind of word processing, it pays for itself. That's mostly what I use it for. If you do any kind of spreadsheets, it pays for itself. Other than that, there are lots of people who don't need computers. One of the big myths is that computers replace all the paperwork, when what they really do is generate more paper. People haven't reached the point where they would rather have it on a CRT than a piece of paper.

Where do you think the business is going to end up?

Leininger: I think we will end up with a few standardized types of microcomputers. And it will become more of a software business. I think IBM is going to do a very good job of maintaining its dominance in that part of the marketplace. Apple's got a very good chance of staying. Radio Shack, due to the fact that we have 9,000 stores out there, has got some critical mass that's hard to overcome.

When we first started this business, it didn't really matter what the computers were used for because people just wanted to have computers. We know what some of the applications are now, and those are pretty well taken care of, like word processing and spreadsheets.

For the industry to grow, I think people need to start taking a look at what people actually do at work and at what would make it easier. Computers might not necessarily be the right answer. They sometimes get in the way.

What would you like to see happen with the software for your computers?

Leininger: I guess one way would be to have a computer with Macintosh kinds of functions built in. That's a tall order, but if you take a look at some of the clever stuff that's come out recently like [Living Videotext, Inc.'s] Thinktank, which is an outline process, you'll see that there are some new classes of software coming out. I would like to see our Model 100 with all the software built in.

What is going to happen to the price of microcomputers and the software — do you think it's going to plummet?

Leininger: I think the price of the hardware has plummeted as far as it can for the short term — it's pretty deathly low. I don't think we have begun to see what is going to happen to the price of software. My guts tell me that $49 and $99 are the right prices for business software. Home software ought to be like records — $9.99 max. These are just my own feelings and don't necessarily reflect the view of the corporation.

records received from or destined for the mainframe.

File Exchange™ A file transfer software package that supports bi-directional transfer of data over coax or modem connections between PCs and mainframes running CICS, TSO and CMS applications.

Coax Exchange™ Lets a PC emulate a 3278/9 display terminal via coaxial connection.

Bisync Exchange™ *3270* Allows bisynchronous PC-to-mainframe communications; 3274 cluster controller, 3278/9 terminal and 3287 printer emulation.

Bisync Exchange™ *3780* Allows a PC to emulate a 3780 or 2780 Remote Job Entry workstation. Also provides PC-to-PC 4800-baud communication, with data transparency.

Async Exchange™ An add-on software package for asynchronous communication including DEC™ VT100/52 emulation between PCs and DEC as well as other asynchronous mainframes.

ClusterNet™ *3270 and ClusterNet*™ *3278* Allows a master PC to emulate a 3274 cluster controller, and up to 3 additional PCs to emulate 3278/9 terminals via a multidrop twisted-pair cable.

PC Exchange™ Asynchronous communication between IBM PCs, and between PCs and asynchronous mainframes; DEC VT100/52 emulation; fully integrated telephone management system including electronic mail.

PC Exchange™ *with SNA* Combines the functions of SNA Exchange and PC Exchange in one complete package.

The intelligent solution is just a phone call away.

If you want to avoid a head-on collision with your information system, call us, toll-free 800-523-8396 outside CA, 800-223-1744 inside CA. Or contact one of our reps listed below.

Either way, we'll show you how the Exchange Series can help launch you into a whole new realm of communications possibilities.

For an extremely down-to-earth price.

BRICKLIN

(Continued from Page 15)

uses a computer as a tool to make that job easier.

How do you feel about what has happened with Visi Calc? That you produced something that was innovative and attractive and then saw the multitudes crowding into the field?

Bricklin: That always happens. On the other hand, I'm the only one who is going to be first. Everybody, like the people at Lotus [Development Corp.], admits that we were the ones who blazed the trail.

What do you think of the other spreadsheets? Are they as good as yours?

Bricklin: Each has its advantages and disadvantages. Some of them did not understand the philosophy about creating a useful tool. Those that are most like Visi Calc are the most successful. The one that was closest to Visi Calc was Lotus [1-2-3]. Lotus tried real hard to be like it and to add things that we hadn't added yet. These were things people were asking for but which didn't break the conceptual framework set up by Visi Calc. That's one reason Lotus was successful. Multiplan didn't catch on as well because [Microsoft Corp.] did things a little differently.

Visi Calc was designed to be keystroke-efficient. In other words, it's got to be very natural to use because it may take you some time to learn it — all these things take time to learn — but it really pays off in terms of how easy it is. You are going up against paper and pencil.

I remember when [Sorcim Corp.'s] Supercalc was first being shown. It didn't have some of the very important basic features of Visi Calc, which the company didn't think were needed. It had not been tested, but when it hit the market, [Sorcim] had to quickly throw these features in. We all find it humorous thinking back about it.

What do you think will be the fate of all the companies that are producing similar products?

Bricklin: They all hope they are going to be the one that makes it. The same thing happens in every industry. Every industry has its dominant players, and the dominant player changes from time to time. First Radio Shack, Commodore and Apple were the dominant players. Then the industry started splitting into business machines and home machines, and IBM came into the picture. The perturbations and swings are really wide now as the industry develops. It's harder to change some things because they are starting to get embedded.

Silicon Valley is certainly going through some ups and downs right now.

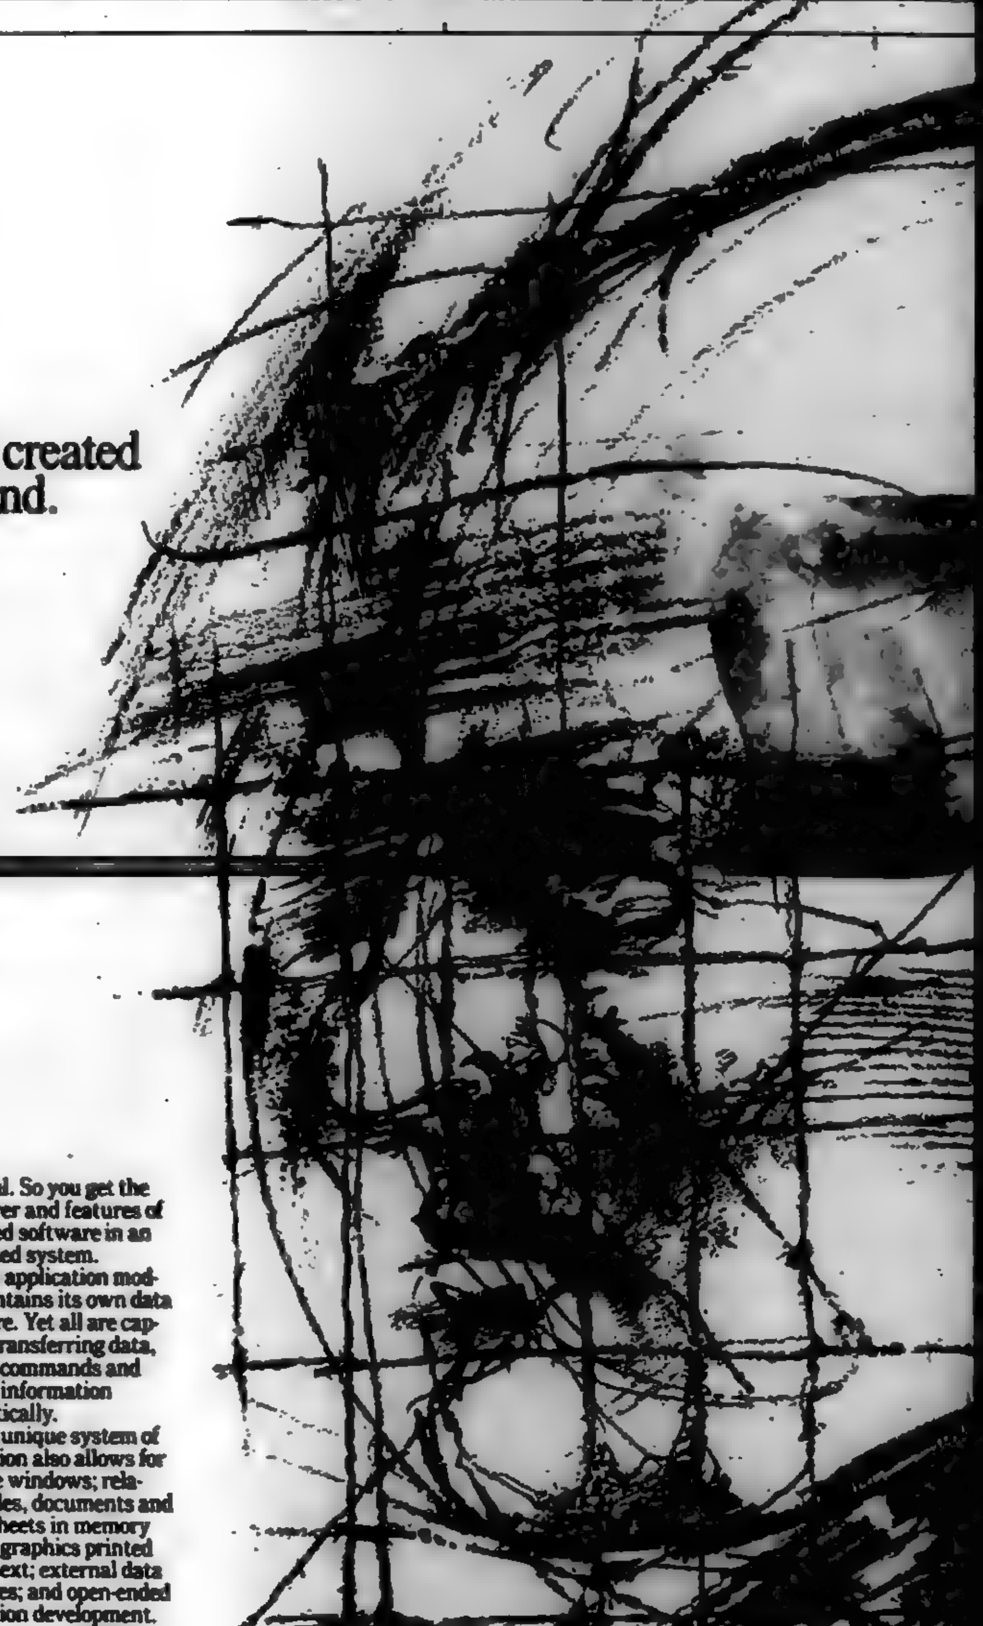
Bricklin: The semiconductor industry went through that, too. People are always trying different ways of doing things, and some work and some don't. They are taking great risks, and when you take great risks, sometimes you fail. This is especially true when the goal is to be No. 1, and there can only be one No. 1. By definition, you're going to see some falling by the wayside. There isn't enough market for everybody.

Visi Calc has always been a solid performer in the Apple market. There is nothing like TK! Solver, and we just started shipping it for the Macintosh. The Macintosh is a great opportunity for software developers, although it takes a long time to develop software for it. Therefore, most software that is available so far has not been very good. A good Macintosh program is harder than doing a good program for another machine because the Macintosh really shows flaws in the program.

Many people see the keyboard and the screen as a barrier to using computers. They don't want to see a computer, they want to see an appropriate tool.

Bricklin: You have to give people an appealing metaphor. A lot of people, unless they are writers, don't want to think in terms of the typewriter metaphor. They will think in the screen's metaphor if it presents what they are used to seeing on some other graphics medium. That is why spreadsheets were so well accepted: The screen looked like a spreadsheet.

People were really turned on by the Macintosh because



Introducing the smartest tools ever created for the business mind.

The Smart Software System.

Smart Software, featuring The Smart Spreadsheet with Graphics, The Smart Word Processor and The Smart Data Manager, is the first software system with the unique intelligence and inherent logic to perform the way you think. Which makes applying the power of a computer to business tasks more effortless and effective than ever before.

It's awesomely powerful, yet amazingly simple. And with its greatly advanced and unprecedented capabilities, it sets new standards by which all other integrated business software will be measured.

ACHIEVING FULL INTEGRATION WITHOUT COMPROMISE

Unlike all-in-one integrated packages, Smart Software is structured on the concept of modular integration. Where each dedicated application can achieve its own maximum potential. So you get the full power and features of dedicated software in an integrated system.

Each application module maintains its own data structure. Yet all are capable of transferring data, passing commands and sharing information automatically.

This unique system of integration also allows for multiple windows; relational files, documents and spreadsheets in memory at once; graphics printed within text; external data interfaces; and open-ended application development.

It's a system of integration without compromise. Integration that is not only better; it's smarter.

It doesn't matter what is on the other side of the box. The idea, often, is to have the computer do things as if it were a person — except this person doesn't tire and is very quick.

it looked like something they would like to deal with. A lot of people don't feel that the keyboard looks like what they think they want to do, and they are right. For certain things, typing commands is not the best way. The Macintosh's interface caught the imagination of many people because it is the graphic representation of something physical, like dials, buttons and levers.

What I think is super about the Macintosh is that there isn't one right way of doing things. It's like those little dolls that they make for little kids with snaps and buttons and zippers and ties. In the different Macintosh programs, there are different ways of doing things. In the paint program, you use the hand, and on the word processor, you use a scroll bar. To the user, however, it all feels the same because it all feels natural.

The mouse is a little strange because you are doing something one place and seeing it somewhere else.

Bricklin: For doing a paint program, a mouse is more natural than a keyboard — just as a music program would not be natural with a mouse but would be with a music keyboard. The high-resolution screen, the mouse and these other interfaces are letting us get closer to the natural representation of the task.

Eventually, you would get used to using Macpaint to the point where it would seem natural, and all your old skills would be useful. That wouldn't happen if you were typing coordinates on a keyboard.

One great problem with microcomputer use is that the software seems to require so much input in relation to what comes out. Do you think there is ever going to come a time when the software is so sophisticated that only a few keystrokes are needed?

Bricklin: First, computers are very output-intensive, especially microcomputers, because people expect the screen to be very lively. They don't interpret the amount of output as being as immense as it is. What is important is that the amount of input you are doing feels excessive. Most of the things we do with computers, like word and number processing, require that you input the information into the computer, and that is kind of a drag.

However, once you get into a communications environment, like electronic mail, all the information is already in the computer, and you are only manipulating it. Then a computer becomes very manipulation-intensive.

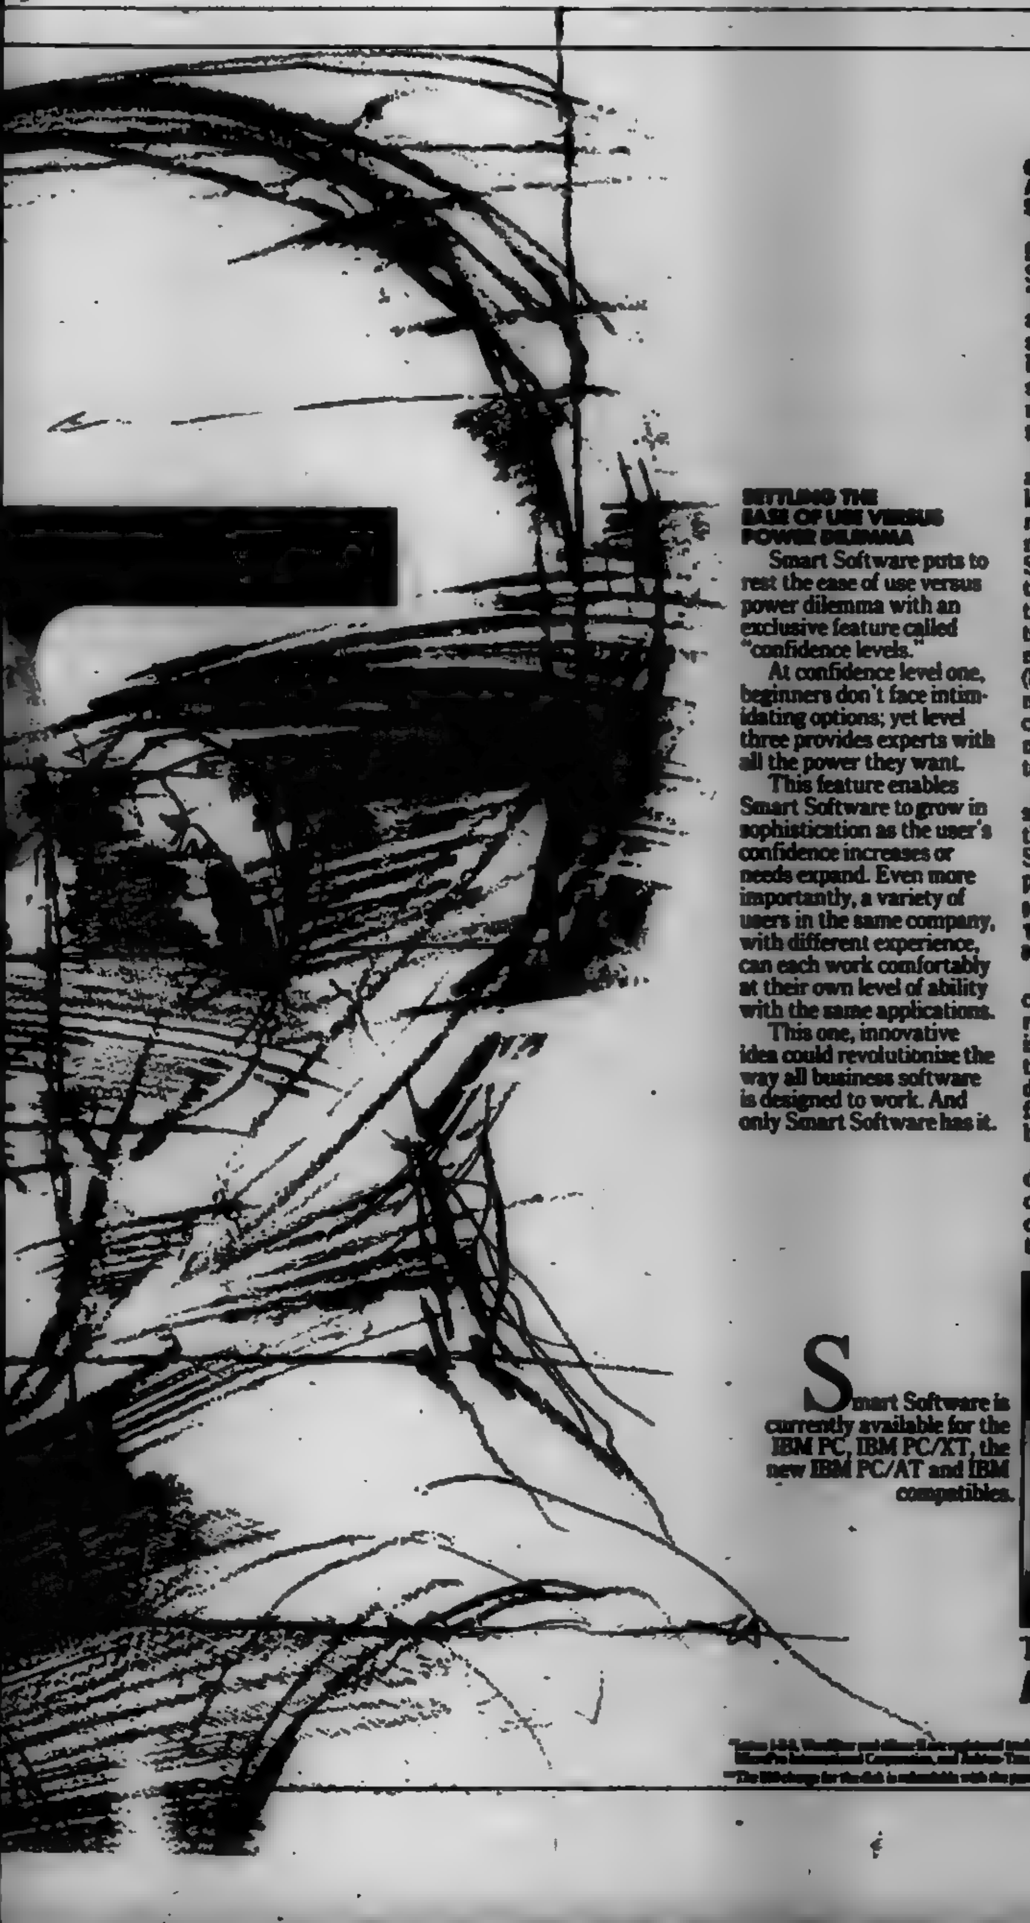
But you still have to key in the messages.

Bricklin: That's true, I do type my messages, but I only write a few a day and I get a whole lot sent to me. So there is very little typing in and a lot coming out. The interface on the commercial data systems is not very easy, but if you could get that wealth of useful, up-to-date information, it is no longer so input-intensive, it is only manipulation-intensive.

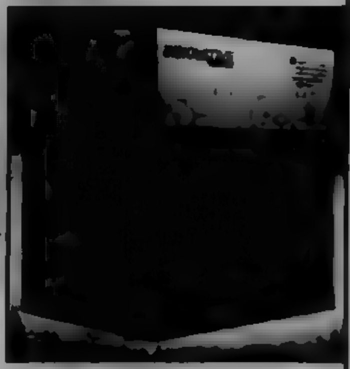
In order to get to that point, somebody has to input a huge amount of data.

Bricklin: Some of it would be originally produced on a computer, so that many people would be doing just a little bit each day. Eventually, the total volume of information that anyone could receive or access would be enormous.

Some of the new input devices will make it easier, too. Wang sells a device under which you can put a picture or document, and it is stored as an image. As storage and



SETTLING THE EASE OF USE VERSUS POWER DILEMMA
Smart Software puts to rest the ease of use versus power dilemma with an exclusive feature called "confidence levels."
At confidence level one, beginners don't face intimidating options; yet level three provides experts with all the power they want.
This feature enables Smart Software to grow in sophistication as the user's confidence increases or needs expand. Even more importantly, a variety of users in the same company, with different experience, can each work comfortably at their own level of ability with the same applications.
This one, innovative idea could revolutionise the way all business software is designed to work. And only Smart Software has it.
CREATING CUSTOM APPLICATIONS BY SIMPLE MENU SELECTION
Perhaps the most significant aspect of Smart Software is its unique "project processing" capability. It allows the user to set up customized projects, like a monthly sales report system or multi-year business plans, simply by doing them once.
There's no need to learn a complex programming language. The user merely makes simple English command selections. Smart Software then remembers to complete the project in the same way again at the touch of a button. Not by memorizing keystrokes (like a macro), but by automatically learning your custom sequence of commands and freely adjusting to changes and edits.
No other integrated system has a capability that even comes close to Smart Software's project processing.
HELPING PEOPLE TO WORK SMARTER, NOT HARDER
Smart Software was created to work for you, relentlessly. Structured to integrate between applications, automatically. And designed to perform multi-faceted business projects, brilliantly.
See your local computer dealer for a demonstration, or call 800-GET SMART to order a Smart demonstration disk.**
Smart Software is currently available for the IBM PC, IBM PC/XT, the new IBM PC/AT and IBM compatibles.



The Smart Software System
INNOVATIVE Software

data transmission costs come down, it will be more common.

It would be even more useful to be able to use voice recognition if they ever figured out how to do it right. When you can store and understand the voice, you can eliminate typing.

The more that original transactions are done on the computer in the first place, the easier it will all be. It is just as easy to produce the original on the computer as it is on any other type of equipment. One of the main reasons we are so input-intensive is that we are switching from manual systems to computer systems. We will eventually be typing everything into a computer, and if you ever need paper, you can produce it — just as the Xerox machine made paper a lot more valuable, because now you can copy a piece of paper and distribute it to many people quickly without having planned to do so in advance. The same thing could be true of computers.

There are advantages to using the computer, but you have to have enough of those advantages to make it worthwhile putting data into the machine in the first place. Then everybody must have a computer and be connected to the networks. There are many reasons for that to occur, and it's slowly coming about. I think that over the next few years, we are going to see more and more of that.

So you are seeing the interconnection of not only homes but businesses with enormous data bases.

Bricklin: The most important thing is to interconnect desks — one person's desk connected with the rest of the group. Then one group connected to another group within the company and all companies connected together. All of this is technology we have now. We just haven't put it all together, because there are so many different standards and so much work getting it all together so that it is easy to use. The hardware technology is there; the software technology is there, too; we don't have to invent anything. It's not like inventing voice recognition — all the pieces are there, but the volume has to be great enough to get the costs down, and everyone has to agree on a standard way of doing it.

Given the commitment we have to the current technology, do you think a computer that is radically different from what we have now will ever be developed?

Bricklin: I don't think it matters what's behind the box. All that matters is that the user uses the things that one normally uses to communicate — like hands, fingers or voice — in ways that seem natural to the senses. Then it doesn't matter what is on the other side of the box. The idea, in many cases, is to have the computer do things as if it were a person. Except this person doesn't tire and it is very quick.

So your view of the future is interconnectedness from person to group to company to everybody — and as human an interface as possible so that the technology becomes less visible.

Bricklin: The Macintosh opens up a whole new realm of how to communicate with a computer. It was designed to do that. They pushed the "enticingness" as much as possible because they want to sell machines. However, it is still uncomfortable for some adults to even think of using a machine, while many of the kids take readily to it.

We still have not truly integrated microcomputers into the home. They are mostly used for word processing and games.

Bricklin: That is because they are not connected. Today, the kind of electronic mail that is becoming prevalent is the answering machine. You always know that you can receive information at your leisure and that it will be received. Imagine if all the people you knew were actually linked together by computer. You could sit there with Macpaint and produce your own really nice message, send it off to everyone and be done. My friends are not on an electronic mail system yet. If they were, we would use it instead of answering machines.

What do you think of the fate of the microcomputer in the business world?

Bricklin: Just ask anybody who uses a personal computer on his desk if he would get rid of it and go back to the way he used to work. Most people will say no. The micro is here to stay.

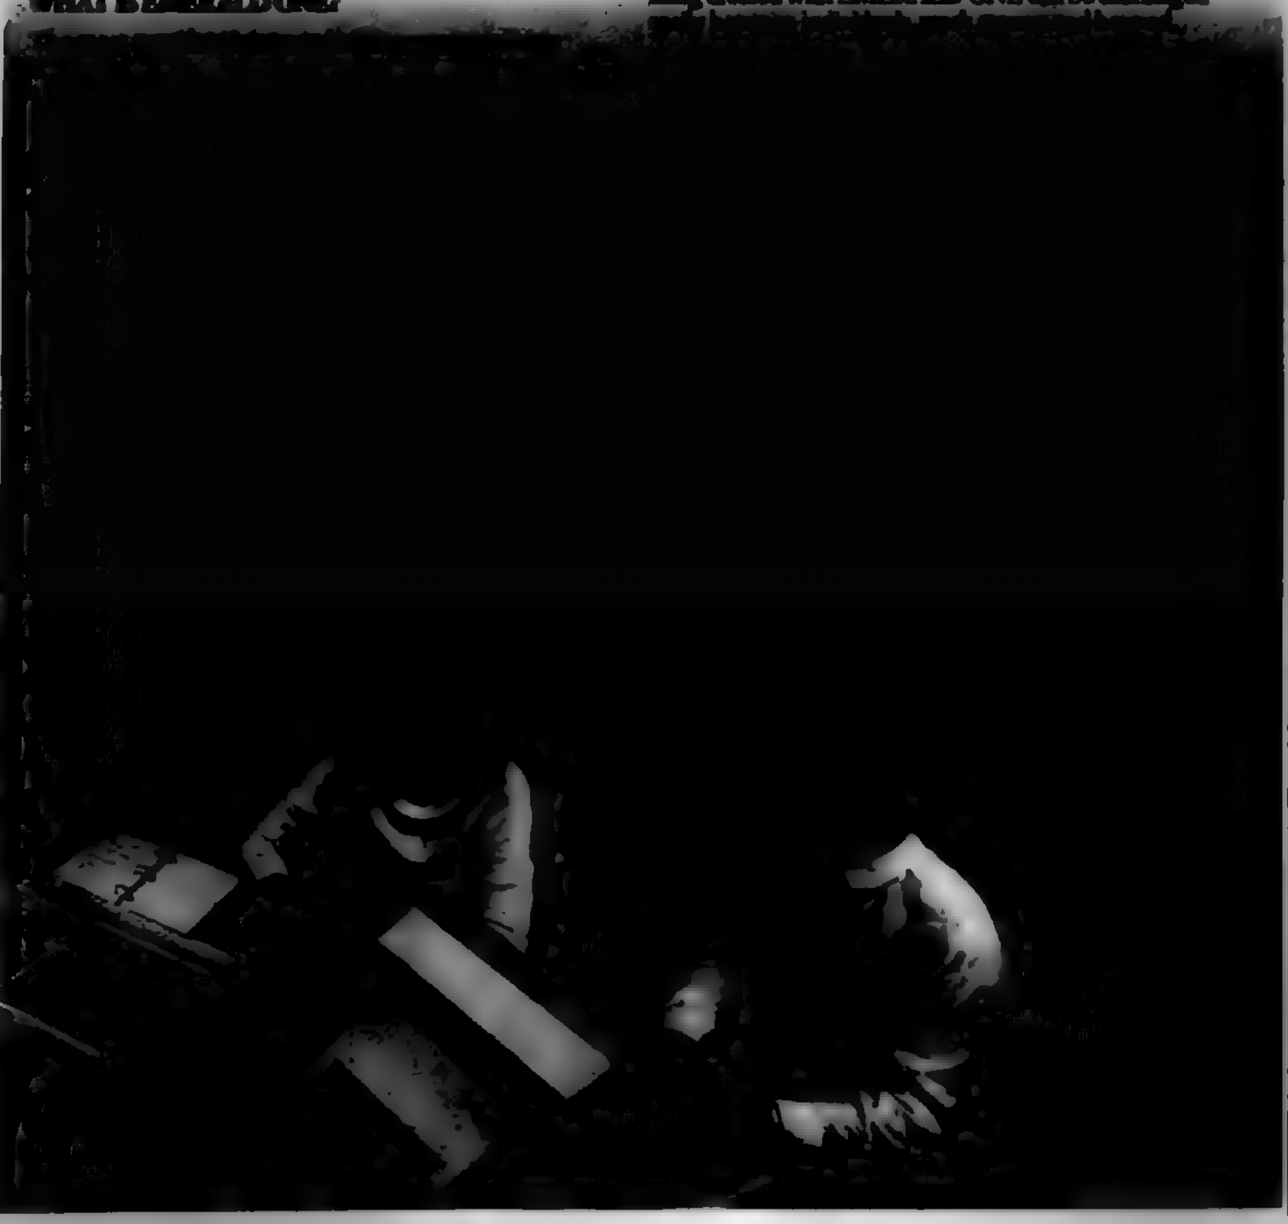
EMERALD ONE™

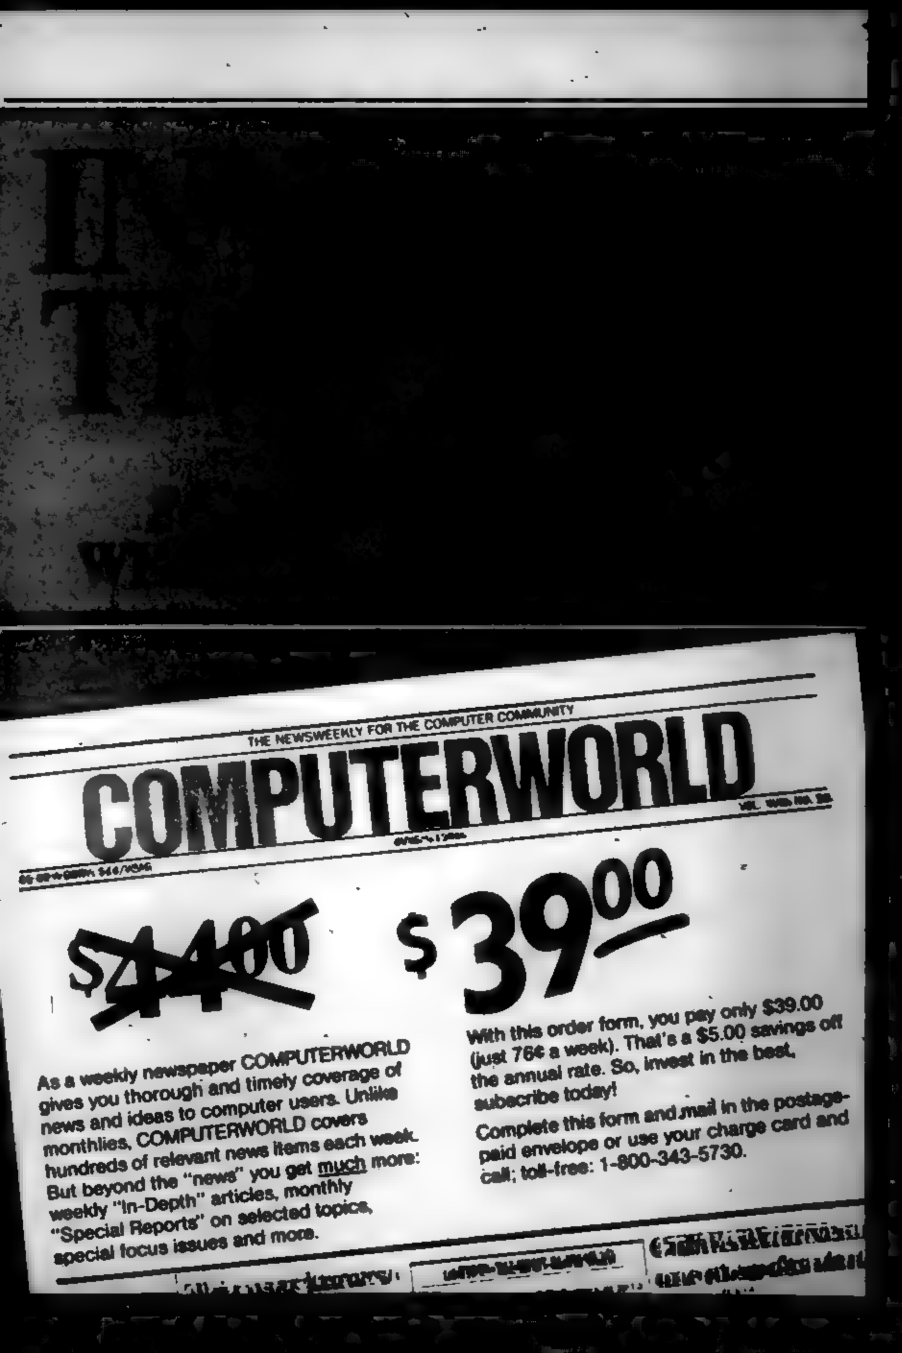
SOFTWARE WITH COURAGE, BRAINS AND HEART

WHAT IS EMERALD ONE?

SOFTWARE FOR THE WORK GROUP

EMERALD ONE goes far beyond stand-alone personal computer software by linking individuals and their work groups. With EMERALD ONE, users work as a communicating group, not as isolated individuals. Whether it be a document, spreadsheet or personal diary entry, everything created with EMERALD ONE can be exchanged





THE NEWSWEEKLY FOR THE COMPUTER COMMUNITY

COMPUTERWORLD

~~$44.00~~ $39.00

As a weekly newspaper COMPUTERWORLD gives you thorough and timely coverage of news and ideas to computer users. Unlike monthlies, COMPUTERWORLD covers hundreds of relevant news items each week. But beyond the "news" you get much more: weekly "In-Depth" articles, monthly "Special Reports" on selected topics, special focus issues and more.

With this order form, you pay only $39.00 (just 76¢ a week). That's a $5.00 savings off the annual rate. So, invest in the best, subscribe today!

Complete this form and mail in the postage-paid envelope or use your charge card and call; toll-free: 1-800-343-5730.

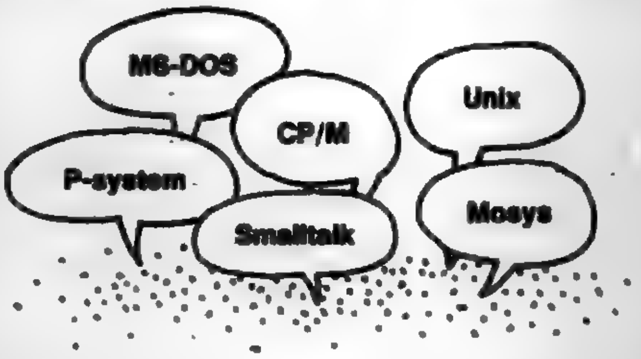
TOM MONAHAN

advantage of current technology.

For discussion, consider eight basic aspects: rapport, access, communications, flexibility, portability, reliability, capacity and performance.

Since the primary objective of an operating system is to allow a person to communicate with a computer through a collection of application programs, the human interface, or human rapport, is at the top of the list. If computers are ever to become widely accepted in the general marketplace, there's no doubt that they have to become easy to use. The prerequisite is, of course, that they be easy to learn. Someone once said that computers must become "intuitively obvious to the most casual observer."

Such a system will most likely take advantage of pull-down, noncryptic menus, windowing, bit-mapped graphics and a mouse-controlled cursor. These items have already simplified word processors and spreadsheets, and there's no reason they should not be used in operating system development. Other likely features will include the ability to back out of errors gracefully before information is lost and the ability to use a "scratch pad" to allow information to be passed from one application program to another in a consistent way. Finally, the standard applications such as word processing, data base and spreadsheet should be available as basic functions of the operating system itself. Their operation should not have to be relearned from implementation to implementation.



Access defines the computer's ability to store and retrieve various information. A window to hierarchical directories will be required to find a data object among much larger data systems. These data objects or files should have the appropriate security if they are available in multiuser or networked environments. A supportive file type should include fixed and variable record length, character strings, images, sound, index and directory files.

The operating system should handle these various files by type; that is, image files should automatically invoke graphics systems, sound files should deal with microphones, speakers and sound generators and so on. A multiple-accessed relational data base should be a basic facility of the operating system. Wild card and partial key access should also be included.

Because communications is rapidly becoming a mature technology, it is important that operating systems define standard methods of dealing with this information exchange. Remote access to material over the local or global network should remain transparent to the user, except for the physical limitation of response time. Facilities should be included to handle global communications such as Compuserve, the Source, electronic mail and other modem-based systems in a consistent manner. Local-area networks with even greater bandwidth should contain even more sophisticated facilities. Each user on these networks should be both a server and a client. This arrangement would allow equal exchange of information, files and even devices.

> Someone once said that computers must become "intuitively obvious to the most casual observer."

Of course, since this operating system will be inherently multitasking, it would also support a multiuser environment. An appropriate security system is required to limit access. Finally, as noted above, all of these network intricacies should remain transparent to the end user.

For any operating system to avoid being left behind as technology or marketing evolves, it must maintain high flexibility. This is the only way an important operating system can continue to evolve. One excellent method to achieve this flexibility is the use of the "software bus." This would allow the user to plug in various functions and features as required. The operating system should thus be able, in addition, to serve as a host to alien operating systems and read or write their various disk formats. If a routine can be accomplished better in a different operating mode (say, machine language), the operating systems should readily accommodate that interaction. The

SYSTEMS

ment front end should be easily maintainable by the application programmer.

Portability is also a key issue. The concept involves not only being able to transfer files between various systems, but actually to move the entire operating system to different hardware. This ability to move the human interface from machine to machine means that users will not need to relearn the operation of a new computer when they switch to a system with a different microprocessor architecture. If a computer's basic I/O system (Bios) is designed as a software module to the operating system, portability can be achieved by substituting a new Bios module containing all machine-dependent functions.

No operating system should have to deal with arbitrarily small bounds.

The concept of a software bus with various plug-in modules is also important in considering reliability. For reliability to be achieved in large software systems, each component of the system must, in turn, be reliable. Maintenance of a series of sovereign modules is far easier than tackling an entire system as a whole. Security, transaction logging, backup and restore facilities are also important characteristics of a reliable system. The operating system should also be able to degrade and recover gracefully as it is stressed and unstressed.

As micros become more powerful, the question of capacity gains importance. Advancements in random-access memory (RAM) and disk technology have made it imperative that RAM capacities in the future be measured in gigabytes, with disks designated for terabytes. No operating system should have to deal with arbitrarily small boundaries, such as 64K bytes. These capacities will also encourage performance features such as utilization of RAM disk to gain processing speed.

Actual operating system performance is the final important consideration. Performance is actually one of the keys to achieving successful rapport. Despite the time savings micros afford, people still expect the machine to react instantaneously. An operating system must be efficient for large addressing spaces and have optimized compilers to generate fast native code. The ability to produce efficient assembly code must also be available to the programmer.

With this wish list of operating system features and definitions, it is interesting to evaluate products available today. Unfortunately, most receive poor marks.

MS-DOS performs well but falls behind miserably in rapport; the P-system has good rapport and excellent portability, but suffers tragically in performance; and AT&T's Unix possesses great capacity but little else.

Clearly, a major breakthrough in operating systems has yet to emerge. The Smalltalk project from Xerox Research Center offered great promise, and some of that work is now displayed on Apple Computer, Inc.'s Macintosh (not enough yet to be classified as a usable operating system). Mosys, a new operating system based on Modula-2, is currently being released in Europe. It appears to make great advances in portability, flexibility and especially human rapport, lacking only a good communications function.

While it still is too early to assess accurately the impact of the Smalltalk and Mosys developments, they do offer encouraging signs that the immense marketing pressure exerted from such established systems as MS-DOS and Unix will not completely close the door to technological breakthroughs. Clearly, the hardware to fulfill this wish list is already in production. It now will take only some courage and imagination to make these "dream" operating systems a reality.

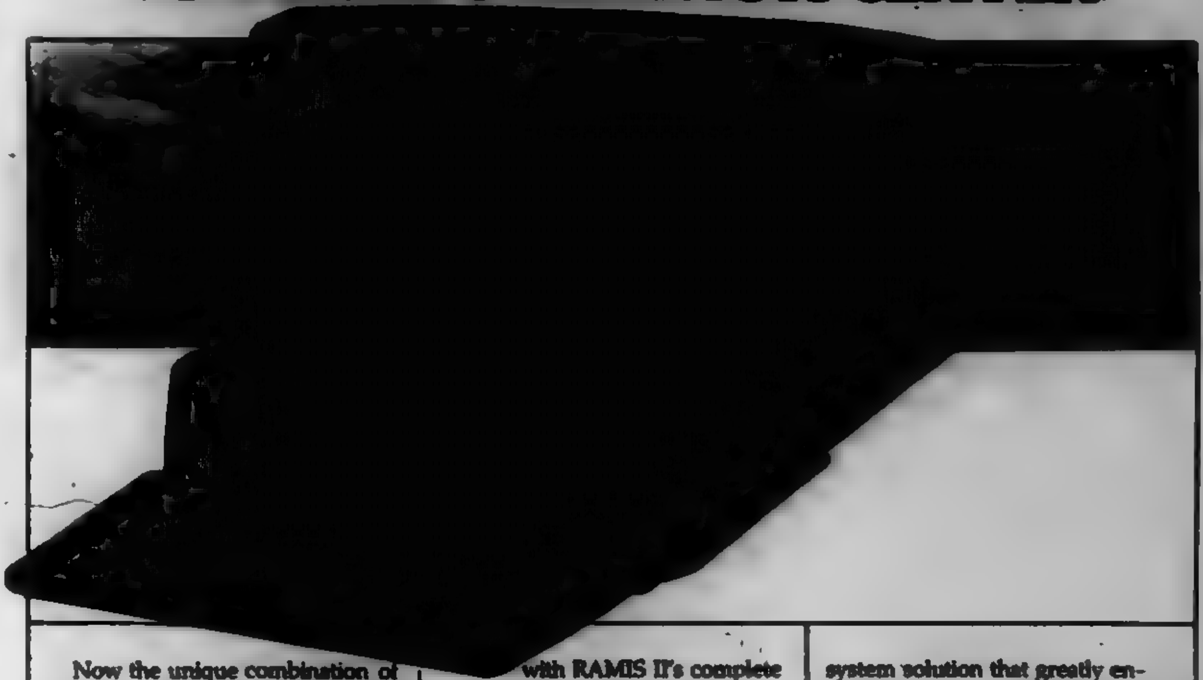
A MAJOR BREAKTHROUGH

RAMIS II TURNS YOUR PC INTO A TOTAL INFORMATION CENTER.



Now the unique combination of 4th- and 5th-generation technology that makes RAMIS® II the benchmark in mainframe productivity software is available for effective PC integration.

RAMIS II/PC: A NEW DIMENSION FOR THE XT/370

RAMIS II/PC brings all the functions of the leading 4th-generation language to the first desktop computer specifically designed to run mainframe software.

Performance-optimized for the XT/370, RAMIS II/PC delivers complete application portability from desktop to mainframe, and can be purchased from Mathematica on its own or together with an IBM XT/370 as a complete, ready-to-run desktop information system.

RAMLINK: HIGH QUALITY PC/MAINFRAME CONNECTION

RAMLink is the most effective way to connect IBM PCs and XTs to the full power of mainframe RAMIS II. Press a single key and RAMLink will put you in touch with RAMIS II's complete full screen environment.

RAMLink downloads data from RAMIS II, IMS, VSAM or other mainframe files, and formats it for immediate use with KeepIT™, 1-2-3™, and other popular PC software. RAMLink also uploads data from the PC—all without expensive protocol conversion hardware.

ITSOFTWARE: FLEXIBLE PERSONAL COMPUTING

Easy to use and flexible, ITSoftware® is a complete local system—from spreadsheet to graphics, word processing to electronic mail—all built around a comprehensive file manager that makes exchanging data simple. Whether you're working standalone or linked to the mainframe, ITSoftware offers the ideal solution for decision support or local applications on your IBM PC or XT.

TOTAL SYSTEM SOLUTION: SEE IT IN ACTION

Mathematica's innovative 3-level PC product line delivers a total system solution that greatly enhances the productivity of both end users and computer specialists. See for yourself at one of our regional Product Demonstration Centers.

RAMIS® II... THE LEADER BY DESIGN

MICRO
TO
MAINFRAME

MICRO
TO
MINI

a major role simply because that is the machine that supports the corporate data base — that central repository of the "soul" of the company. The deployment of micros across an organization, however, changes the way the corporate data base can be used. With micros comes the immediate demand for the ability to move data from the mainframe to the micro and from the micro to the mainframe. The ability to transport data is further complicated by the eventual need to move data from one micro to another.

Another reason for moving data from micro to mainframe may not involve the corporate data base at all — it may be a function of using the most cost-effective storage technology.

In most organizations, there will not be a single solution to the micro-to-mainframe problem. The solution will be partly determined by the intended use of the micro-to-mainframe link, the communications standard(s) used, the composite use of the micros and the sophistication of end users. Clearly, with these different objectives in mind, *the* solution will probably be a compromise among contending interests within the organization.

Another way of confronting the micro-to-mainframe link is to address the corporate problems involved in the deployment of micros. Even while applauding that deployment we must recognize that just as micros can contribute to clearing up many bottlenecks, they can also cause others.

The appropriate use of micros can improve white-collar productivity, limit the growth in demand for clerical employees and provide the tools for producing better information for better decisions. The demand for a reasonable micro-to-mainframe link can also lead to decreased security for corporate data, require more sophisticated communications between micro and mainframe and necessitate the establishment of an extensive support structure for education, maintenance and systems development for micros. Having hundreds or thousands of micros in an organization is very much different from having two or three.

Problem: transactions with the corporate data base. The issue here is simply making the micro function as a terminal. Today there are more than 150 terminal emulation programs or combinations of software and hardware on the market and more coming. A terminal emulation program makes the micro act as if it were some "standard" or popular terminal. Two very important terminal emulations are those that make the micro act like Digital Equipment Corp.'s VT100 family of asynchronous terminals and those that make the micro act like one of IBM's family of 3270-type synchronous terminals. In order to have adequate response time for transactional processing, 9,600 bits per second is the minimum communications speed we would wish to use.

Especially if we have a mixed-vendor or mixed-protocol computing environment — a single user having to access both IBM or plug-compatible machines and asynchronous minis, for example — then one solution is to use an asynchronous terminal emulator and a protocol converter on the IBM or plug-compatible mainframe to make the asynchronous "terminal" act like a 3270. For the Intel Corp. 8088-based micros (such as the Texas Instruments, Inc. Professional Computer, the DEC Rainbow or the IBM Personal Computer) there are a number of VT100 emulators available (the Rainbow comes with one built in, of course).

At the IBM and plug-compatible mainframe end, a protocol converter is plugged into the communications processor or is channel-attached. The protocol converter appears to the mainframe as a 3274 terminal controller. Every protocol converter seen so far supports numerous terminals, but always a VT100. The cost per micro of this solution — including a port on a protocol converter — is about $720.

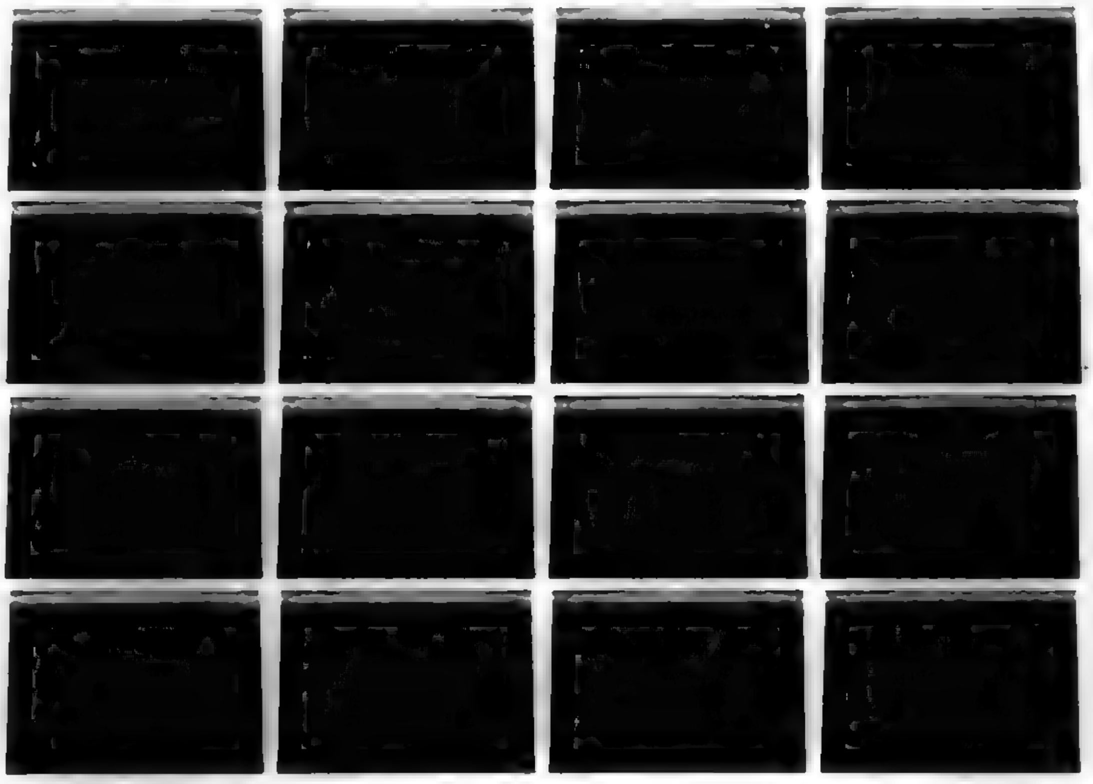
A second approach is to emulate some variety of 3270 directly on the micro. This method, even using the same line speed, frequently produces better response time, since the overhead of protocol conversion takes place at the micro rather than at some remote point.

In one sense, the least expensive way to go is to buy a software package (for between about $200 and $900, depending on the micro) that emulates a combination display station and controller (such as an IBM 3275 or 3276). Communications is via a synchronous RS-232 connection with the communications processor at the mainframe.

The disadvantage of this approach is that one micro workstation will take one synchronous port that otherwise could support up to 32 display stations working through a terminal controller. Some operating system software may have limitations on the number of synchronous lines that may be supported, or the cost of additional synchronous lines on the communications processor may not be warranted.

The alternative 3270 solution is a combination of software and hardware in an add-on board that contains the necessary circuitry for making the micro communicate with a terminal controller (a 3274, for example) via coaxial cable and software to drive the hardware. IBM's 3270-PC takes this approach to its maximum extent; the hardware is integrated into the design of the Personal Computer.

In this configuration, the micro appears to the user almost exactly like a 3270-type terminal and with equivalent speed. The disadvantage is the cost: about $1,200, including the port on the terminal controller and the Personal Computer hardware



And you thought we only ran 1-2-3.

Hercules™ is famous for being the only high resolution graphics card authorized by Lotus™ to run 1-2-3.™ Now we are the only graphics card authorized to run a couple of other programs you may have heard about —Symphony™ and Framework.™

When these hot new programs wanted hot graphics, they chose to support the undisputed leader, Hercules. When you've sold over 100,000 graphics cards, the world takes notice.

At Hercules, we believe that the most important feature in a graphics card is that it should run lots of software —with true full-screen, high resolution graphics on the IBM® PC Monochrome Display. So when you buy a Hercules Graphics Card, you can rest assured that it will run more high-res graphics software than anyone else. Even on the new AT.™

Call 800 255-5550 Ext 415 for the name of the Hercules dealer nearest you. See why the company that made the first graphics cards for the IBM PC still makes the best.

Hercules.
We're strong on graphics.

Address: Hercules, 2550 Ninth St, Berkeley, CA 94710 Ph: 415 540-6000 Telex: [illegible] Features: IBM Monochrome Display graphics resolution of 720 × 348; parallel printer port; full text mode software compatibility; free programming software; 2 year warranty. . and software — not much different from a 3270-type terminal. The advantage: This solution precludes the necessity of putting both a micro and a 3270 terminal on a user's desk.

An interesting modification of the 3270 approach can be found in IBM's recent announcement of a broadband Personal Computer [local-area] Network developed by Sytek, Inc. of Mountain View, Calif. One product available for the PC Network is a 3270 emulator program that turns one Personal Computer into a communications server emulating a 3274 (Model C51) terminal controller and a 3278 or 3279 display station. Up to 32 of the Personal Computers on the network can operate through the server concurrently, acting as individual 3270 display stations to the mainframe. IBM's announcement may end up preempting other new or planned products of a (logically) similar nature, but the concept of interfacing a microcomputer-based local-area network to the mainframe system is important.

> **Downloading from the mainframe to the micro is at once easy to implement and difficult to implement effectively.**

Problem: moving quantities of data. After receiving a micro, a new user frequently wants to download data from the corporate data base on the mainframe to the micro for further analysis or inclusion in reports. Less apparent is the need to upload data captured or massaged on the micro to the mainframe for further analysis with mainframe tools. A growing need for uploading is in using the mainframe as a storage medium for the micro. Micro users also quickly realize the need to move output from the micro to the mainframe so that they can use specialized mainframe peripherals, such as laser printers. We can solve each of these problems in somewhat different ways.

Some mainframe software must interact with micro software. That interaction may not be very sophisticated, but it must take place. Downloading from the mainframe to the micro is at once easy to implement and difficult to implement effectively. If the data to be transferred consists of only printable characters in a sequential file, the only thing necessary on the mainframe end is some listing utility that allows the listing of the data to the terminal. On the micro end, the terminal emulator must only be smart enough to allow capture of the data in a file or memory. If the communications lines are not very clean, some error-checking protocol is desirable.

Many asynchronous terminal emulators allow such file transfer. If the emulator is smart enough, a simple mainframe program may be written that prompts the user for a file name then takes control over the micro to perform the transfer, thus making the downloading more automatic. This process requires a terminal emulator that can be remotely controlled.

In the micro-to-mini environment, the foregoing approach is often used. In a 3270-oriented, data base environment, however, the problem becomes more complex. The first problem is that the software at the mainframe end will be more complicated because files are rarely in simple sequential format. Furthermore, data is often accessed via a data dictionary, which requires intervention of a more sophisticated data retrieval program to obtain information. The block-oriented nature of synchronous communications can also complicate the mainframe software.

Assuming that all these problems have been overcome, then the micro software must also be smart enough to respond appropriately. Many of the manufacturers of 3270 hardware/software emulators are attempting to confront this problem, but it is complicated by the use of a variety of teleprocessing monitors and data base systems. The same technique cannot be used for IBM's CICS and IMS, much less for systems like Software AG's Complete and Adabas. Solutions for this problem will probably come from several sources, including the mainframe software manufacturers as well as the micro peripheral manufacturers.

A different approach to this problem is the use of a software system on the micro that turns the micro into an IBM 3780 or Hasp workstation remote job entry (RJE) terminal. An advantage of this approach is that virtually all IBM systems have the appropriate mainframe software as a more-or-less standard feature. A further advantage is that if appropriate IBM mainframe software is implemented, routing can take place to many other mainframe peripherals.

A major disadvantage is that an RJE line must be specified in the system generation on the mainframe, and it may not be accessible by more than one remote device. The micro acting as an RJE terminal will also take up a synchronous port on the mainframe's communications processor. Where it is appropriate, however, this file transfer technique can be very useful for both uploading and downloading.

A more interesting and exciting class of software just now coming on the market consists of systems that allow the micro to use the mainframe as a peripheral. In a large organization, this software could prove to be extremely useful for archiving documents and data originating on micros, since the mainframe disk drives are always backed up, usually on a daily basis, and security is normally much better. One of the earliest products of this type was Tempus-Link from Micro Tempus, Inc. of Montreal. A product expected to be released in late January is Rdisk from Tangram Systems Corp. of Raleigh, N.C. There may be others on the market or under development. These systems provide both micro and mainframe software with the result that a communications link is established, allowing micro users to think of the mainframe simply as another (although very large) disk or diskette on the micro, accessed in apparently the same way the micro's operating system accesses a local disk.

The speed of these products is dependent on the communications line speed and the method used by the designer to access communications on the mainframe. On the IBM or plug-compatible mainframe end, Tempus-Link uses standard teleprocessing systems, such as CICS or TSO, to take care of communications (a relatively limited technique), while Rdisk will probably use direct access to IBM's Virtual Telecommunications Access Method, which will result in a more flexible and possibly faster system. These products may optionally provide access to data base systems such as IMS or Adabas, as well as the capacity to transfer files from the virtual micro disk for access by other mainframe software. Although such products will probably operate best in a synchronous environment, they will typically allow either synchronous or asynchronous communications.

The two broad needs in the area of micro-to-mainframe links are for transaction processing on the one hand and for sizable data transfers on the other. If organizational policy demands that even when the user is doing micro applications, his work should appear to be in the context of mainframe software, then one set of solutions is appropriate. If, by way of contrast, the objective is to make the system appear to be an extension of the micros' operating environment, then another set of solutions is necessary. There is clearly a variety of products on the market that will provide various resources and facilities, and more are on the way.

Tom Madron is manager of computer services at North Texas State University, Denton, Texas.

PC USERS

SEEKING CANDIDATES WISHING TO CONNECT THEIR PC'S TO MINI AND MAINFRAME COMPUTERS.

Candidates should possess a personal computer and desire to move information between PC's and mini and mainframes.

Your goals should include accurate terminal emulation and file-transfer capabilities.

In return, Polygon[1] offers the industry's best VT100 emulation, error-free file-transfer capabilities, data-entry, on-line updating, program development and text file transfers at speeds up to 9600 baud.

There are a variety of additional opportunities for applicants seeking asynchronous and synchronous terminal emulation and file-transfer capabilities on the mini, micro, and mainframe levels.

Qualified candidates should contact Polygon's Department of Sales Recruitment. Phone calls please!

Representatives from Polygon will be available to speak with prospective candidates personally at COMDEX/Fall, Las Vegas Convention Center, Booth 4300.

THE DIFFERENCE IS EXPERIENCE.

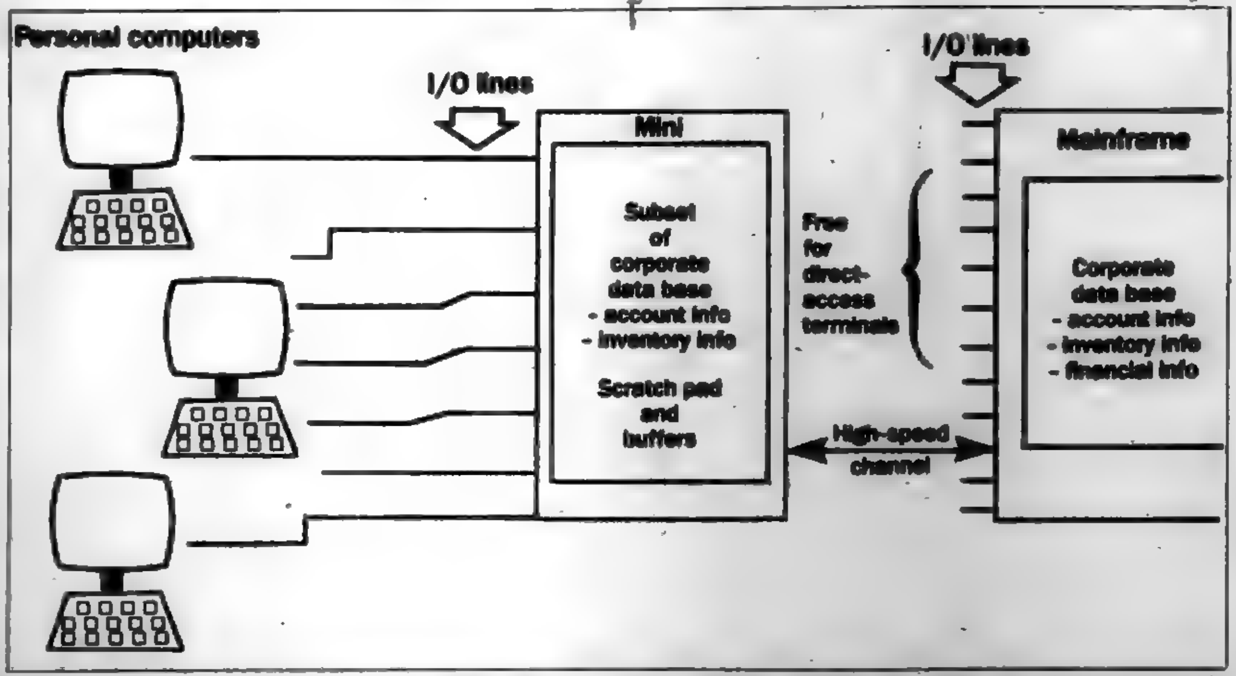
Overall system maintenance costs may actually be reduced with the go-between mini, especially in terms of user-experienced downtime.



Using a mini to facilitate the micro-mainframe link frees mainframe I/O lines and allows hardware-supported hierarchical access to the corporate data base.

(Continued from Page 29)

variable to an already complex problem. But this approach actually can reduce overall system cost, maintenance and complexity.

Personal computers typically entered corporate computing environments in an ad hoc way; individual employees selected the micro best suited to their particular needs. Often this freedom led to a proliferation of different types of boxes, all clamoring to access the corporate data base for as many purposes as there were micros. The DP manager had to adapt to the new, largely unanticipated needs of his users. Problems appeared in at least six areas:

1. Mainframe contention and performance.
2. Control of system access.
3. System maintenance.
4. Security and integrity of data.
5. Costs added by the introduction of micros into the system.
6. Overall system complexity.

The introduction of a mini between the mainframe and the company's micros preserves the performance of the corporate mainframe. Many of the software and network peripheral solutions to the problem impose a burden on the mainframe in terms of disk access, allocation of I/O and communications channels and even CPU time. By having the micros connect to the mini instead of directly to the mainframe, channel contention and allocation are drastically reduced. Disk access, demands of mainframe CPU attention and I/O traffic to and from the mainframe can be regulated and "bursted."

In most cases, personal computers use the corporate data base in a read-only fashion, accessing records from the disk and downloading them for use with the micros. In these environments, an image of the data base (or the most popular parts of the data base) can be downloaded to the mini for micro access, obviating the need for micros to access the mainframe at all. The mini can act as a large, intelligent cache, overlaying less popular segments of the data base with those more in demand.

For records that can be altered, the mini can do presorting, prequalification and other preprocessing, further unburdening the mainframe. The mini also adds to the system several new ports, while only using one mainframe port for its connection. Mainframe ports and channels are freed for use by terminals that must interact directly with the mainframe (see figure).

The mini can also act as watchman or gatekeeper for access to mainframe resources. Instead of trying to control access directly on the mainframe, using complex software devices that chew up CPU time, these control devices can be located on the mini. The data base can be controlled by only allowing micro access to it on the mini and only allowing certain parts to reside (in image) on the mini. The frequency, length and type of accesses the micro makes to the mainframe will be only those allowed between mini and mainframe, and these can be far more easily controlled using the mini.

Finally, control of data integrity and quality can be much better handled with the intervening mini. No valuable mainframe primary memory or disk space will be used for scratch-pad or buffer space. The preprocessing of records on the mini can also serve to quality-check the data before it gets merged into the corporate data base.

Unlike the most popular mainframes, the most popular minis and micros support the closest thing we have to a standard system software base, the Unix operating system. Unix works to smooth over hardware differences between the various types of micros and minis by providing a known, common interface to programs.

Unix allows several different micros to communicate and cooperate in a standard way to other Unix systems. Since it is more likely that the mini rather than the mainframe will support Unix, the mini becomes a key in providing more standardization and better control.

Unix allows programs written on micros to be recompiled to run on the Unix-based mini, and vice-versa. This portability encourages people to use one common set of programs and procedures for any specific application, and the software development process becomes more manageable.

Adding a mini to a situation in which one wants to control micros and mainframes may appear to add complexity to an already complex environment, at the least because it adds another system to be maintained. Overall system maintenance costs may actually be reduced with the go-between mini, especially in terms of user-experienced downtime and its associated costs.

First, many minis today, especially those using very large-scale integration (VLSI) microprocessors, do not need a special environment. No special provisions need be made for a raised floor or air-conditioning, and the mini can be placed close to micro users.

Second, many minis today are becoming fault-tolerant, or high-availability, machines. It therefore becomes unlikely that the mainframe and mini will be down at the same time. The mainframe, which is much more sensitive to maintenance needs, can be brought down for maintenance without closing out all micro users. Their activity with the corporate data base takes place on the mini, which is resistant to crashes and, in many newer architectures, can be maintained and repaired while still up and running with online users. The data base activity can be batched on the mini and bursted to the mainframe when it comes back up.

With respect to security, having the mini as a gatekeeper can allow control of access to the corporate data base and the integrity of the data merged with it. Security often amounts to what in the data bases is accessed when and by whom. These questions can be answered by the way in which micros are configured to the mini and how the mini accesses the mainframe.

There are perhaps many cheaper ways to effect the link, but when the added performance, features and flexibility are taken into consideration, the mini solution is probably the most comprehensive and best in terms of price/performance. Mini-mainframe software links are more stable than their micro-mainframe counterparts. It is as easy to install micro-to-mini software links as it is micro-mainframe links and just about as expensive; but with the intervening mini, much more is gained.

The combined benefits of Unix, fault tolerance, off-loading the mainframe and preprocessing and prequalifying data produce savings in costs related to software development and porting, system downtime, data integrity and mainframe productivity. If a comprehensive accounting were done, it would not be surprising to find that such savings offset the cost of installing a mini.

STORAGE DATA SECURITY: DES DOES IT ALL
DES Data Encryption for IBM PC, XT, AT and most Compatibles

File Encryption - The fastest hardware encryption device (uses DMA or Programmed I/O). Encrypts file in place (no non-encrypted version left on disk). Decrypts in a separate file (no damages to data if given wrong key).

Complete media encryption - Secure up to 26 different storage units (floppy drive, hard disk partition, virtual disk and logical drive) using up to 8 different user choosen keys. SECURE DRIVE encrypts the whole media (file allocation table, directory, data). The storage unit is useless without the key A single call to SECURE DRIVE at boot time and all accesses (reads and writes) to the storage unit are decrypted or encrypted transparently to the user.

Corporate Data Protection - All storage units encrypted using a management choosen key. At boot time, LOCKED DRIVES secures all storage units transparently to the user. Absolutely no data can be stored on disks non-encrypted. The user does not know the key and cannot find it.

XT and other hard disk users - Solve the XT security dilemma - POWER DRIVER subdivides your hard disk to create arbitrary storage units that can be secured for multi-user private storage while retaining all XT features.

Network users - An Application Interface Port allows operation of DES application software to be extended to logical drives (storage units) defined by a compatible block driver for Local Area Networks, virtual disks etc...

PORTABLES FOR THE MOBILE

The inherent limits of portables now prevail over their advantages.

By Hal Glatzer

The closer a portable's performance is to a desktop personal computer's, the broader its distribution will be through conventional channels. That's one reason people aren't yet buying many portables, according to Charles Satuloff, president of Teleram Communications Corp. They are waiting to see what's coming.

Truly portable computers — weighing only a few pounds and driven by batteries — have not yet reached that level of performance, and sales are languishing. Manufacturers and advertisers are targeting

High performance driving machines

finely tuned for 100% compatibility with IBM's PC.

The sleek, aerodynamic lines of StorageMaster drives promise high performance. The underlying state-of-the-art electronics deliver it.

- StorageMaster 500 Series Fixed Disk Drives, as fast as they look, are ideal for frequent accessing of large data bases and local area networking applications. An average seek time of only 40 milliseconds, makes them twice as fast as most other drives. Plus, you boot directly from the drive.

Available in both 18 and 30 megabyte models, the 500 Series offers data storage up to 3 times that of IBM's PC/XT.

- StorageMaster 700 Series Streaming Tape Drives provide back-up storage of selected files or image copying of entire disks. They store data safely on readily available 45 megabyte cartridges.

StorageMaster drives are built under stringent quality control, maintenance-free, and backed by Control Data's 25 years of on-line experience. StorageMaster is true high performance you can count on for years to come.

CONTROL
DATA

mobile professionals who work away from their offices. Those people seem to want special-purpose software for standardized tasks, such as auditing or sales. They will be first-time buyers, but they want full portability without giving up functions. Price and software compatibility with other systems are secondary to them.

However, the current buyers of portables — the ones who have driven the market so far — are less mobile in their professional lives and more generalized in their needs and wants. They are also more sophisticated users for whom a portable is their second computer. They want portables that run familiar software packages for word processing and spreadsheet functions and whose files and operations are compatible with the desktop software they already use and understand.

The battle for the market today isn't between portables and desktops, but among the portables themselves. There are three sizes: suitcase, notebook and briefcase.

Suitcase systems weigh between 20 and 30 pounds. Such a portable ("transportable" or "luggable" might be a better word for it) is really a desktop computer that has been squeezed into a tight box, yet is every bit as powerful. It has a 9-in. CRT screen and at least one 5¼-in. disk drive through which it can load off-the-shelf software. The Osborne Computer Corp. system was the first successful portable, but since its decline, Kaypro Corp. (for the Digital Research, Inc. CP/M market) and Compaq Computer Corp. (running Microsoft Corp.'s MS-DOS) have been the leaders.

Most of the IBM Personal Computer clone makers offer a Compaq clone, too. Suitcase computers are portable offices that can be set up wherever there is an electric outlet. They are priced between about $1,500 and $2,500 (an optional hard disk doubles the price) and are popular with people who can afford to buy only one system.

Micro lightweights

Notebook computers are the ultralight aircraft of the computer world. Battery-powered machines like the Tandy Corp. Radio Shack Model 100 or the NEC Information Systems 8200 weigh only four pounds and are no larger than a looseleaf notebook, though they have full-size typewriter keyboards. Through a liquid crystal display (LCD), they present eight lines of 40 characters each. They can't run the same software as desktop computers do, but instead have built-in software on a read-only memory (ROM) chip.

Though limited in power and memory capacity, they can do serious work; journalists have adopted them as substitutes for portable typewriters and can send stories to their editors over telephone lines. Starting at only about $600, these systems are an inexpensive way to take work on the road — as long as the buyers keep their performance expectations within reason.

Briefcase computers are a second generation of portables after the notebooks. Weighing about eight to 12 pounds, they are more powerful than the notebooks in three important ways: They hold more memory (at least 128K of random-access memory [RAM]), they can display more text on their screens (16 lines of 80 characters each) and they come with programs (in ROM) that are almost identical to the most popular disk-based programs for desktop and suitcase computers.

> **The briefcase and notebook computer industry is waiting for IBM to introduce a product that will "legitimize" the market.**

Versions of Lotus Development Corp.'s 1-2-3, Micropro International Corp.'s Wordstar and Sorcim Corp.'s Superwriter come on Hewlett-Packard Co.'s 110, Epson America, Inc.'s Geneva and Sharp Electronics Corp.'s PC-5000, respectively. Those machines cost between $2,000 and $3,000.

The Data General Corp. portable, the DG/One, is operationally compatible with the IBM Personal Computer and runs applications such as Wordstar, Lotus's Symphony and Ashton-Tate's Dbase II. The 9-lb unit features a flat liquid crystal display that provides a 25-line, 80-column screen.

Because many users want complete portability, battery power is required for notebook and briefcase systems. But the most expensive briefcase portable, from Grid Systems Corp., needs AC to power its electroluminescent screen, bubble memory chips and 1,200 bit/sec modem. So, of course, Grid's vice-president for marketing, Alan Lefkof, challenges the assumption that portables need batteries. "If you're an auditor and your client doesn't have an AC outlet in his office, you don't want to audit him anyway!" he says with a smile. But Grid has developed a 3-lb, lead-acid battery pack, he notes, "in case customers ask for it."

The briefcase and notebook computer industry is, right now, in the same position the microcomputer industry was three years ago — wait-

New, SQL on your PC. Identical to the one on your mainframe. Improves productivity of End Users and DP professionals alike.

For the PC user

QINT/SQL
The 100% IBM compatible relational database system. At the programmer and user level, **identical to IBM's SQL for mainframes.**

English Like Language
Easy to ask questions and get answers. Type in questions on your PC or microcomputer rather than searching through reams of output listings for desired information.

Access data from the IBM mainframe computer on your PC-XT or microcomputer and handle it yourself, without need to program or fear of altering databases.

QINT/EXPERTS
For hotline, user, and technical support.

QINT/Computer Aided Training
Self-Teaching Module, runs on your PC.

AVAILABLE NOW!
Call us at:
1-617-332-2743
1-617-527-9329

For the EDP Professional

QINT/SQL For the microcomputer, identical at the programmer level to IBM's SQL/DS and Database-II systems on 4300 or 30XX mainframe.

QINT/IAM - Information Analysis Methodology to allow design and installation of databases with the user's participation. Base the database system on plain English. ISO Standards compatible 3 schema approach.

QINT/TIIA-Tools for Information Analysis. A Data Dictionary System that generates the tables and all the documentation for your database.

QINT/ADT - Application Development Tools. Automatic generation of commands. Generation of code for SQL(embedded in COBOL or Pascal) or ISQL(interactive).

Hardware and Operating System Independence: MS-DOS, MPM, Concurrent CPM, and UNIX. Any hardware using 8086, 8088, 68000 or compatible.

ing for IBM to introduce a product that will "legitimize" the market. (IBM's suitcase computer competes against Compaq in the market that Compaq developed.)

> **The automotive, publishing, government, legal and insurance sectors are ready to automate their traveling personnel.**

Tom O'Brien opened a store in Rochester, N.Y., that sells only portables. But he has noticed a fundamental problem that new users must overcome. "People who are out of the office are on their own. In the office, there's always someone to help you use the computer to get over a hurdle. Outside people need machines that make it clear how to use them — so the seller doesn't have to." He likes HP's Help screens for 1-2-3. "Making the computer do what you want shouldn't get in the way of closing the sale," O'Brien says. "The user has to be able to do what he wants to do in a natural and intuitive way."

Today's market is horizontal, with word processing and spreadsheets for everyone. But the next big wave of sales will come from vertical and niche markets. The automotive, publishing, government, legal and insurance sectors are ready to automate their traveling personnel. Niches within those industries include field sales, technical service and auditing.

"The office is automated, the factory is automated; the field personnel are next," says Teleram's Satuloff. "But the cost to automate them is high. They travel a lot, and their salaries are expensive. There will be an explosion of portable workstations — faster than prognosticators expect — but only with corporate sponsorship or when smaller companies can improve their payback time."

Compaq and the other suitcase computers are selling well, but people have not flocked to buy notebook and briefcase portables. Sales have been disappointing.

According to Bert Sperling, president of Dataccount, an OEM software house, "Radio Shack has sold only half of the 350,000 Model 100s for which it contracted with Kyocera [the manufacturer]. Convergent Technologies, Inc.'s Workslate is dead and gone because spreadsheets were not the answer to the world's problems. Xerox Corp. shut down its 1810 operation.. And I can't talk about sales of the Micro Office or the Teleram, because I don't know if they've had any yet."

Reliable sales figures are elusive. Egil Juliussen of Future Computing, Inc. admits he can't track the sales of many portables because so many are available through mail-order houses or are acquired in government purchases, neither of which are included in his surveys.

Businessland, Inc.'s product manager, Paul Schumann, says flatly: "For a primary computer, trade-offs are not acceptable. Portability does not make up for a small display, higher price or lack of disk. Portability is a feature — not a class of machine or reason for buying. But it makes a secondary computer acceptable, especially if it carries a discount from the desktop's price. After all, for $3,000, a person could buy another desktop computer. Portability shouldn't be expensive. Users set their minimum requirements for power and features, and the trade-offs they have to make for the current wave of portables are below the thresholds those users have set. That's why sales have been disappointing."

The problem seems to lie in the nature of portables themselves; so far, their inherent limitations are prevailing over their advantages. It hasn't happened yet, but briefcase computers are probably going to dominate the marketplace for portables after 1985. Increased demand is driving down the price of 25-by-80, flat-panel LCDs. There is a down-sizing of desktop machines, through innovative packaging, denser memory chips and new manufacturing techniques, such as surface-mounting of components on both sides of a printed circuit board.

A corresponding upscaling of features on notebook portables is bringing in 3½-in. disk drives and squeezing software more economically onto ROMs and programmable read-only memory in smaller quantities (for example, Microsoft Corp. is releasing Multiplan in ROM for the Model 100).

So, the two trends will probably meet in the middle. In the words of Visual Computer, Inc.'s marketing director, Bill Machanic, "The hybrid will be a desktop in a portable package that may never be moved."

John Banning, vice-president of software development at the now-defunct Gavilan, agrees. "A portable may be thought of the way a telephone is: Its value isn't in its portability but in its connection to a network." They may be powerful, he says, "but in terms of features, the portable computer will always be a generation behind the desktops."

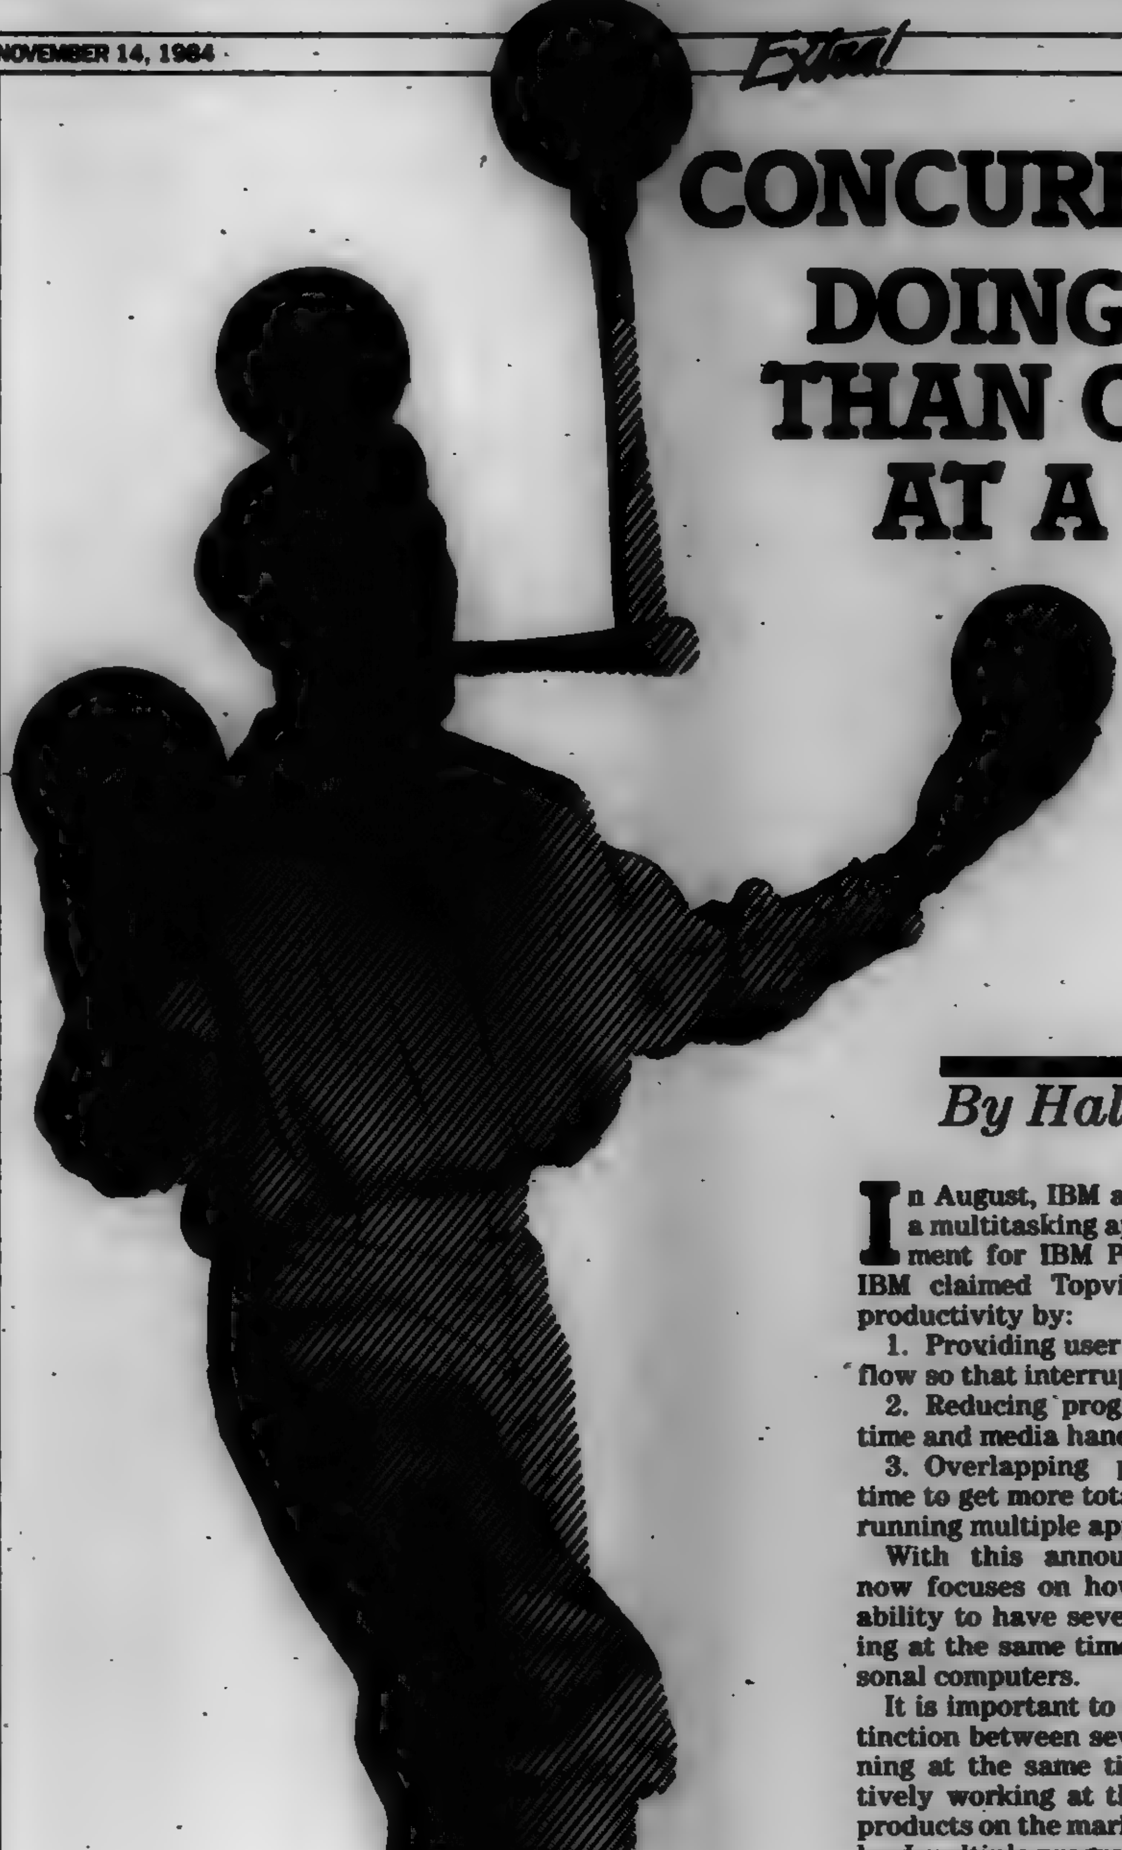
COMPUTERWORLD
THE NEWSWEEKLY FOR THE COMPUTER COMMUNITY



THE BETTMANN ARCHIVE, INC.

CONCURRENCY — DOING MORE THAN ONE JOB AT A TIME

By Hal Steger

In August, IBM announced Topview, a multitasking applications environment for IBM Personal Computers. IBM claimed Topview could increase productivity by:

1. Providing user control of the work flow so that interruptions are easier.
2. Reducing program start and stop time and media handling.
3. Overlapping program execution time to get more total throughput when running multiple applications.

With this announcement, attention now focuses on how concurrency (the ability to have several programs working at the same time) can apply to personal computers.

It is important to understand the distinction between several programs running at the same time and several actively working at the same time. Some products on the market allow the user to load multiple programs at once, yet only one can be active at a time. Other products, such as Digital Research, Inc.'s Concurrent PC DOS, allow several programs to be actively working at the same time. A personal computer running Concurrent PC DOS could receive

> **Switching from one application to another is a much more natural, convenient way to work that leads to increased productivity.**

electronic mail, sort a data base, print a report and compile a program, all at the same time.

There are two main benefits of personal computer concurrency: increased personal productivity and low-cost solutions for the computing needs of a department or small office.

Increased personal productivity

What do these tasks have in common?

- Printing a report or plotting a graph.
- Sorting a file or generating a report.
- Compiling a computer program.
- Executing a long program or lengthy calculation.
- Checking a document for spelling errors.
- Receiving or sending files over the phone; talking to a mainframe.
- Backing up a hard disk.

These tasks require anywhere from a few minutes to several hours and do not need human intervention. They are usually performed one at a time on personal computers. The result is that the user waits to use the system while the tasks are running.

Concurrency allows the user to perform such tasks and still use the system for other work. Consider the financial analyst who spends 30 minutes a day receiving stock information from Dow Jones, updates his clients' portfolios, performs stock analyses and writes letters to his clients. With concurrency, the analyst could do everything at once. The result is that he has time to handle more clients or conduct more research. He increases his personal productivity.

Concurrency also increases productivity by allowing for smoother handling of work flow interruptions. Many executives use several software applications such as Lotus Development Corp.'s 1-2-3, Micropro International Corp.'s Wordstar and Software Publishing, Inc.'s PFS:File during the course of a day. As the person uses his computer, he is constantly interrupted by phone calls, visitors and messages. And as the person works, he needs to reference information contained in different programs. Without concurrency, the executive would have to save the files, exit an application and start a second application. With concurrent processing, he can run his most commonly used applications at the same time so that he can switch easily from one application to another. This switching from one application to another is a much more natural, convenient way to work that leads to increased productivity.

Low-cost, multiuser solutions

There are several obvious considerations when providing computers for a group of people. How much will each person need and use a system? How much information must be shared? What is the optimum way for people to share expensive peripherals like letter-quality printers and hard disk drives?

Depending on needs, the hardware/software solutions range from expensive personal computer networks to inexpensive time-sharing systems.

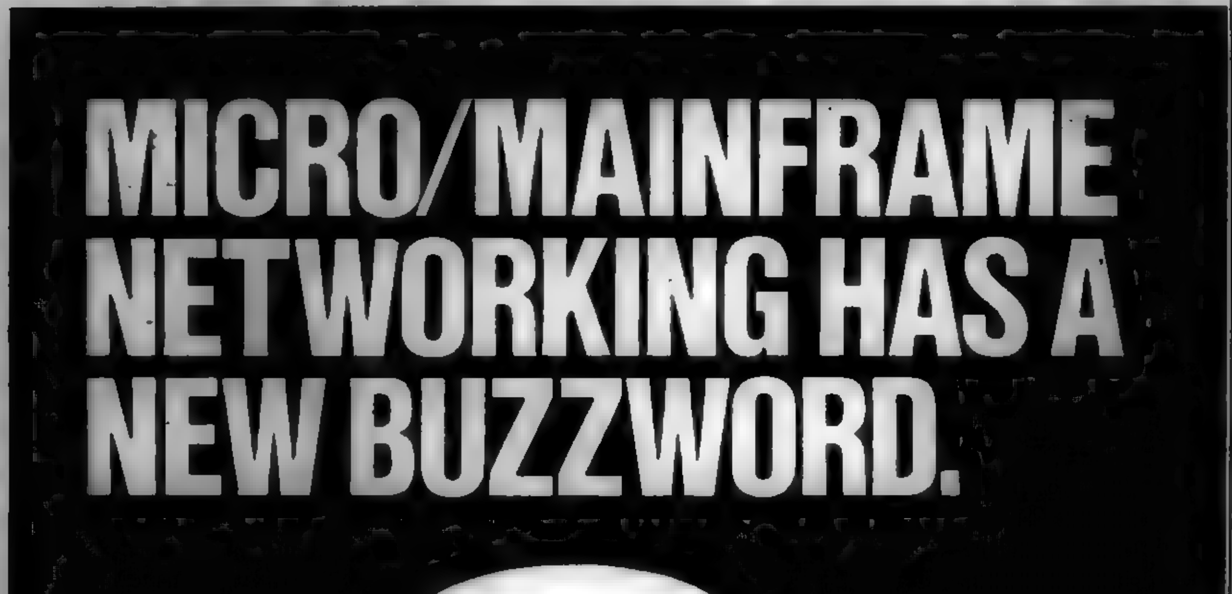
Personal computer concurrency leads to a low-cost solution to the computing needs of a department or small office. Consider an office with a manager, a secretary and a salesman. The secretary might need to use a computer all day for word processing; the manager will use the computer several times a day for project management and financial analysis; and the salesman might want to phone in orders or check inventory levels.

One solution is for each person to buy his own computer and for the group to network them together. A cheaper solution would be for the office to buy just one personal computer and give everyone a terminal. Concurrency allows this arrangement, combining the best of the microcomputer and minicomputer worlds. People can run the same software and get the same response time that has made personal computers so popular; yet they can share information and expensive peripherals in a way that has made minicomputers successful.

Concurrency holds several implications for Fortune 2000 companies and software developers. It is ideal for personal computer communications: Users can perform electronic mail, networking or micro-mainframe communications in the background and still use their personal computer for other work. Further, computerizing a department with a personal computer and several terminals is a low-risk way to learn about and implement multiuser systems. Several people can access the same applications and data simultaneously at little incremental cost over the price of a personal computer.

Fortune 2000 companies should also be aware, when evaluating and purchasing software, whether the software supports concurrent processing.

Software developers can realize



MICRO/MAINFRAME NETWORKING HAS A NEW BUZZWORD.
"Programmatic Interfaces." Pass it on.
PATHWAY

YOURS FREE
For complete details on *pcPATH, the only micro/mainframe link with Programmatic Interfaces,* return this coupon to Pathway Design Inc., 177 Worcester Street, Wellesley, MA 02181 or call toll-free 800-343-0515 today.
(In Massachusetts, 617-237-7722.)

Don't gamble with your micro-mainframe link.

Informatics deals you a winning hand.

Some micro-to-mainframe "links" solve only part of the problem. (Example: It's really no link at all if your end users can't figure out how to use it.)

Informatics software-to-software system is *the* complete solution. And it's priced surprisingly lower than less effective systems.

It's easy to use.

Informatics link is custom tailored to the PC software your end users already know. Including dBASE II and III, Framework, Lotus 1-2-3, Symphony, VisiCalc and many others.

Its simple, menu-driven approach gives them the data they need *and* the solutions to their problems.

They don't have to learn special commands; they don't even have to know the PC keyboard. If they can move a cursor, they can extract mainframe data.

And it's easy to install at the mainframe, too, with all the help you need from Informatics local System Engineers.

Security is in your hands.

You maintain total management of your company's information *and* the gateway to PCs. You determine which user profiles may gain access to which files. You determine valid passwords.

You control the mainframe.

You can provide immediate or deferred response to user requests. And you can classify different requests—and different users—by your own priorities.

Complete access to mainframe data.

There's no second-guessing what data might be called for. No limited "substation" database. The Informatics PC link accesses virtually all mainframe database systems, including IMS, IDMS, Total, Adabas and VSAM.

You select the data.

The Informatics system has qualification logic built in. You deliver *only* the data your end users really need.

Send for a free Informatics demonstration package!

This one simple, software solution gives maximum flexibility at both the mainframe and the micro level. Whether you want to use Informatics Lotus/Answer, VisiAnswer or dBASE/Answer, you can see how for yourself with our free demo package for product. Supplies are limited, so send the coupon today.

YES. ☐ Send me a free Informatics micro-mainframe demo package with no obligation.

THE LIGHTS WILL COME BACK ON. YOUR DATA MAY NOT.

When the power goes down, so does your computer—maybe taking your data with it.

If you had last year's sales figures with next year's projections on screen, you're going to be in the dark a long time. Maybe too long.

Unless you backup your data.

Every day.

No matter what.

The smartest way to do that is with a Tallgrass HardFile™ Mass Storage System.

Shown above, the 20 megabyte HardFile with 20 megabyte tape for $2,995.

TALLGRASS SELLS MORE HARD DISK STORAGE WITH CARTRIDGE TAPE BACKUP THAN ANYONE IN THE WORLD.

Tallgrass took the industry's most reliable medium—magnetic tape—and perfected a format that's become the standard for personal computers.

We used a removable tape cartridge to store data out of

harm's way. And made two versions. Our 3000 Series HardFiles combine tape's accuracy with the enormous capacities of hard disk, with 12, 20, 35 or 70 megabytes storage with a removable cartridge tape for backup.
Our 4060 tape storage system, for personal computers with hard disks built in, supplies 60 megabytes of backup capacity.

Result: the world's best selling mass storage systems with the most reliable data protection.

And a decidedly enlightened approach to doing business.

For a free brochure, your nearest dealer, and more good reasons to backup, call 1-800-228-DISK.

Before the lights go out.

Developers will want to take advantage of safeguards such as record and file locking to ensure smooth operation in a concurrent environment.

productivity gains by developing software in a concurrent environment. It is possible for a programmer to compile a program, debug a program, print a listing and test a program, all at the same time.

As concurrency gains acceptance, a new class of applications will sell. We are beginning to see electronic mail packages that allow users to work on several tasks simultaneously. At the same time, developers should become aware that their products will be used in a concurrent, and perhaps multiuser, environment. One decision software developers face is whether to write software for specific hardware or write software that is "well-behaved" and written to the operating system.

The old trade-off was that software written for specific hardware performs much faster, yet cannot easily be rewritten to run on different computers. A new consideration is that applications must be written to the operating system to work in a concurrent environment.

As concurrency creates a market for itself, developers might choose to develop well-behaved applications to give their products a competitive advantage in this area. It also means that developers will want to consider taking advantage of safeguards, such as record and file locking, to ensure smooth operation in a concurrent environment.

Limitations and costs

There are three main limitations of personal computer concurrency. First, personal computers that support concurrency require greater hardware investments in memory and fixed-disk drives than computers that run only one program at a time. Both Topview and Concurrent PC-DOS, for example, recommend a computer configuration with 512K bytes of memory and a hard disk. These figures compare with 256K of memory and two floppy drives for a single-tasking computer.

Second, concurrency produces more processing overhead than the single-tasking counterparts, which makes running some applications in a concurrent environment impossible or less desirable. If a person performed only word processing all day, he would, of course, receive no benefit from concurrency. In addition, as concurrency supports several tasks simultaneously, system resources must be shared among tasks. Tasks that require dedicated resources, such as process control applications, are not well-suited for a concurrent environment.

Third, there is an extra cost involved in supporting concurrency because concurrent processing is more complex than running one application at a time. When more than one program is run at a time, a new class of problems can develop, because of the way programs interact and share system resources.

A class of concurrency-based software applications will emerge for the office. The first applications will focus on satisfying communications needs such as electronic mail. The next generation will be productivity-tool-oriented.

As personal computers increase in power yet decrease in cost, the hardware will support concurrency with better system performance and response time. As white-collar professionals strive for increased personal productivity, they will adopt concurrent computing tools.

■

While some disks lose their way in the torrid zone of drive heat, Maxell guarantees safe passage.

A lifetime warranty. And manufacturing standards that make it almost unnecessary.

Consider this: Every time you take your disk for a little spin, you expose it to drive heat that can sidetrack data. Worse, take it to the point of no return. Maxell's Gold Standard jacket construction defies heat of 140°F. And keeps your information on track.

And Maxell runs clean. A unique process impregnates lubricants throughout the oxide layer. Extending media and head life. How good is Gold?

Maxell's the disk that many drive manufacturers trust to put new equipment through its paces. It's that bug-free.

So you can drive a bargain. But in accelerated tests, Maxell was an industry leader in error-free performance and durability. Proving that if you can't stand the heat you don't stand a chance.

maxell.
IT'S WORTH IT.

See us at Comdex, Booth #1178

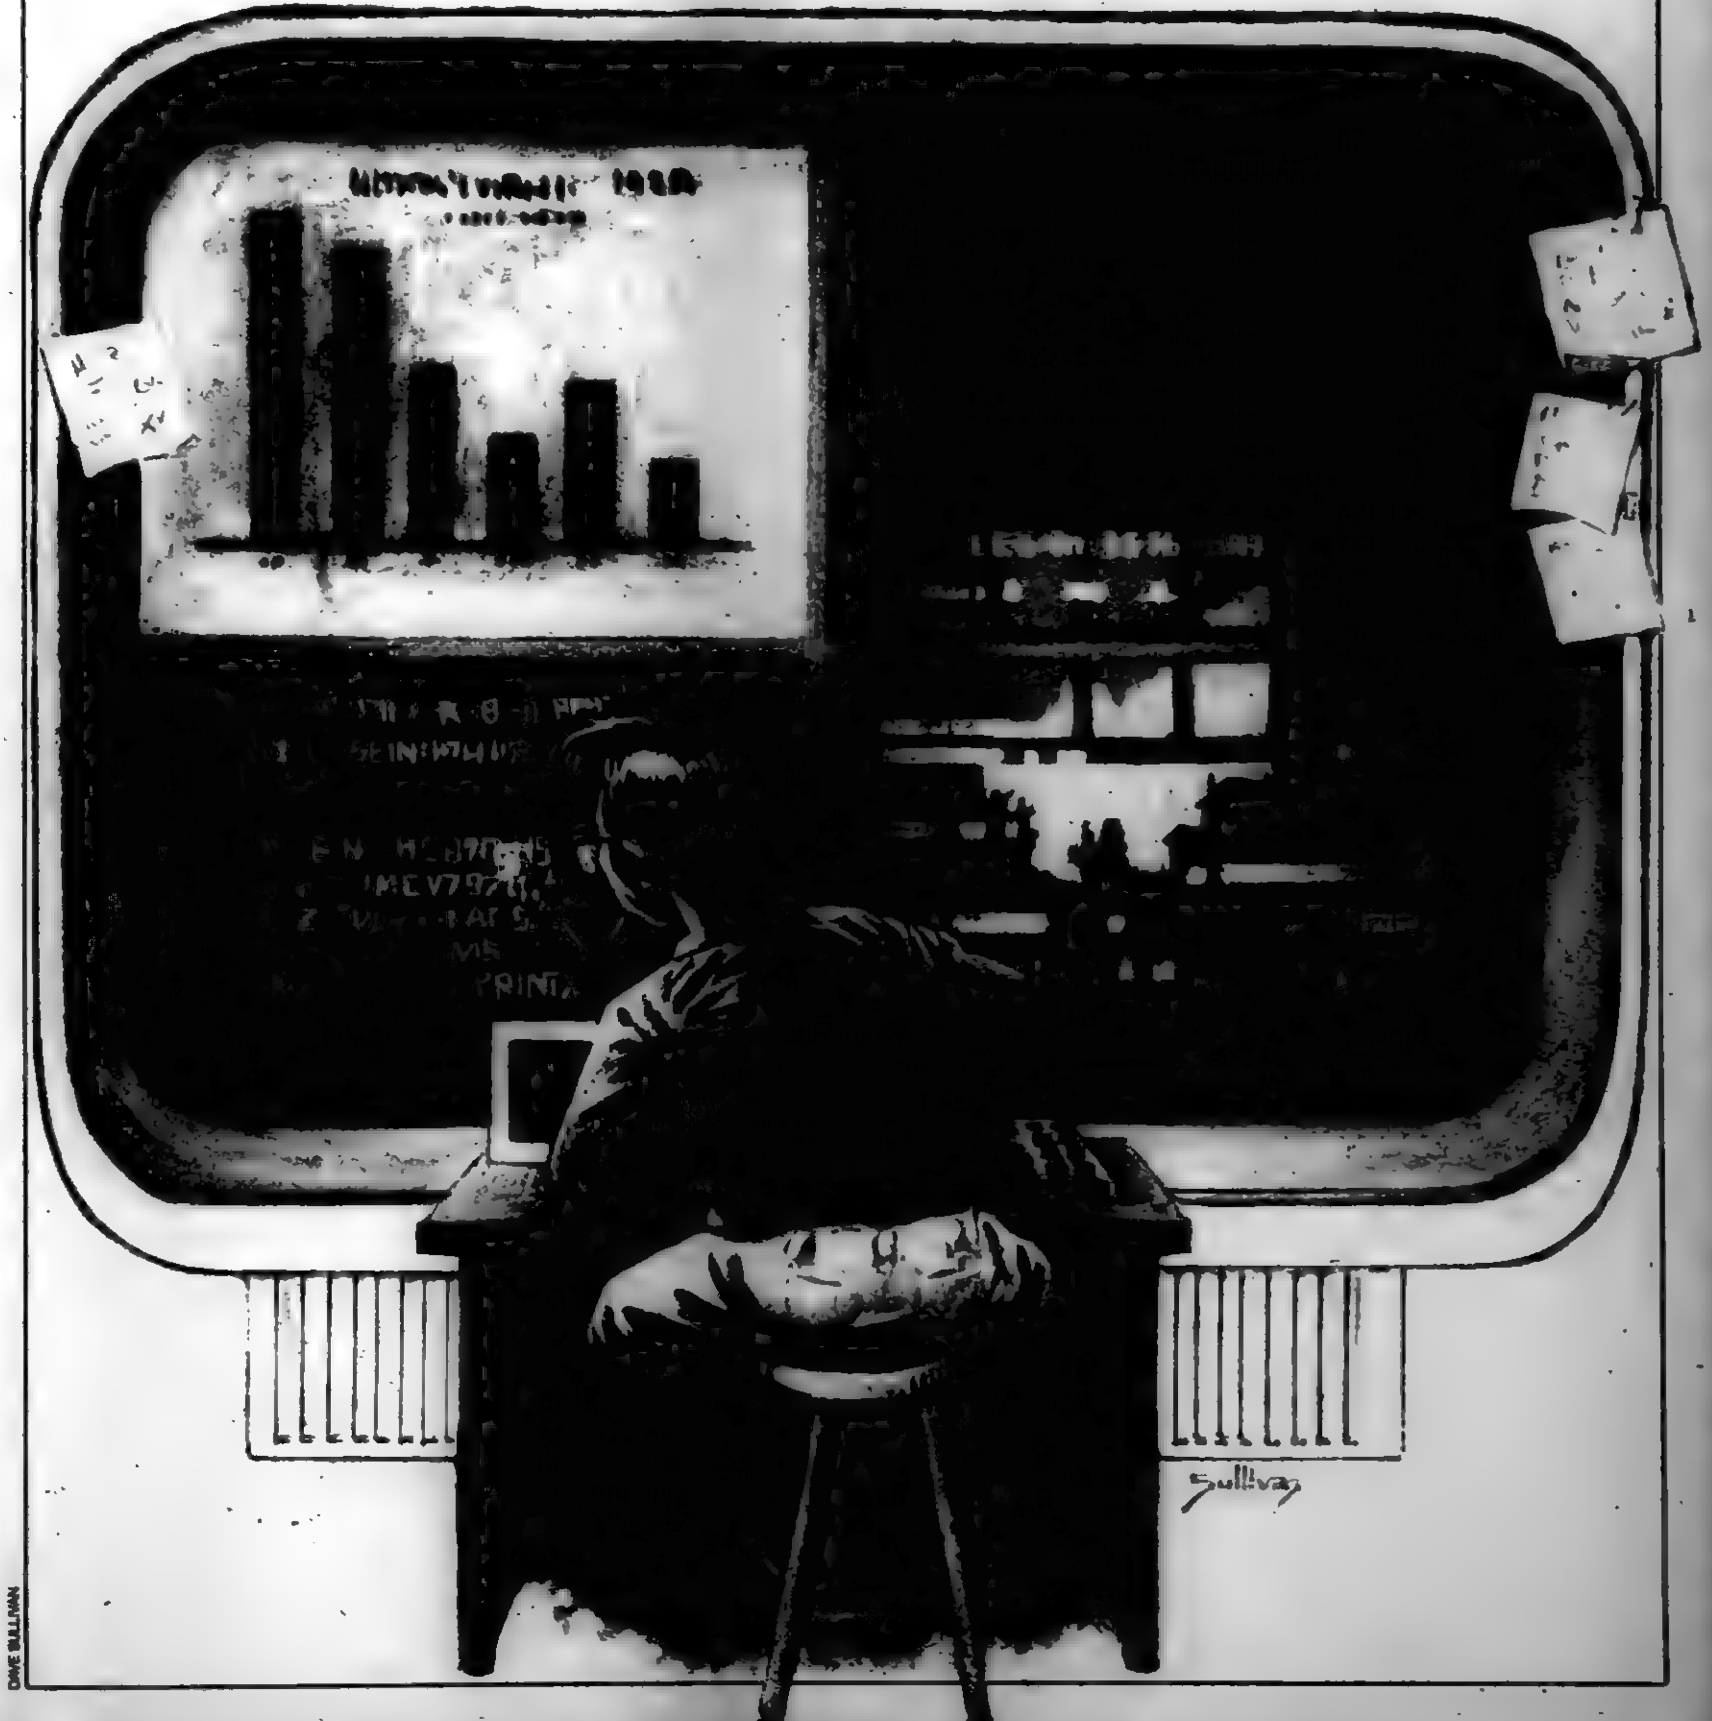
THE UNIVERSAL WORKSTATION

By Kenneth Sullivan

Many of today's stand-alone professional computers could turn out to be white elephants as corporations realize that micros that function in both stand-alone and networked modes are the better investment.

Information is most useful when it can be shared, compared and communicated to other people within an organization both locally and remotely. By choosing the right professional computer, corporations can both protect their investment and plan their office information processing requirements wisely.

The "right" professional computer addresses not only the personal productivity needs of the individual user but also the growing corporate need for truly integrated



DAVE SULLIVAN

systems and specialized communications networks and services, including data and word processing, image and audio processing and multiple business application software solutions. It is, in short, the multifunction workstation — a system that meets the broad needs of personal computing and office information processing with one desktop machine.

Professional computers function effectively as multifunction workstations in the business environment if they meet the following six major requirements:

- Stand-alone applications, including the wide range of IBM Personal Computer software.
- Host workstation applications.
- Communications flexibility, including terminal emulation and local-area networks.
- Participation in multivendor environments.
- Integration of office information processing tools.
- A growth path to new imaging, voice and multiuser technologies.

Stand-alone applications

Multifunction workstations should be able to run the variety of available stand-alone applications that meet multiple business needs, such as word processing, spreadsheet, data base and business graphics. Users today also want access to software packages and systems that solve problems specific to their industry.

In addition, the thousands of software packages on the market today written for the IBM Personal Computer make some degree of Personal Computer compatibility a major requirement in selecting a multifunction workstation.

The major difference between a professional and a personal computer lies in the availability of professional-quality software. While many of the stand-alone applications today run on both professional and personal computers, it is the user-friendliness of the more sophisticated, advanced packages that entices professionals to use them for individual processing tasks. In this context, professional quality is defined by how easy the software is to learn and use. It appears that menu-driven software, for example, will distinguish professional computer/multifunction workstation applications, as long as the procedure standardizes around a given menu approach.

Host workstations

Professionals solving today's complex business problems need information from many internal and external sources. They require access through professional computers to larger systems in the corporation, including departmental minicomputers and host mainframes. They need access to corporate data bases in order to capture segments of that data and format it into management reports; thus, the need for host-integrated workstation applications. A professional computer provides emulation capability for multiple host workstations.

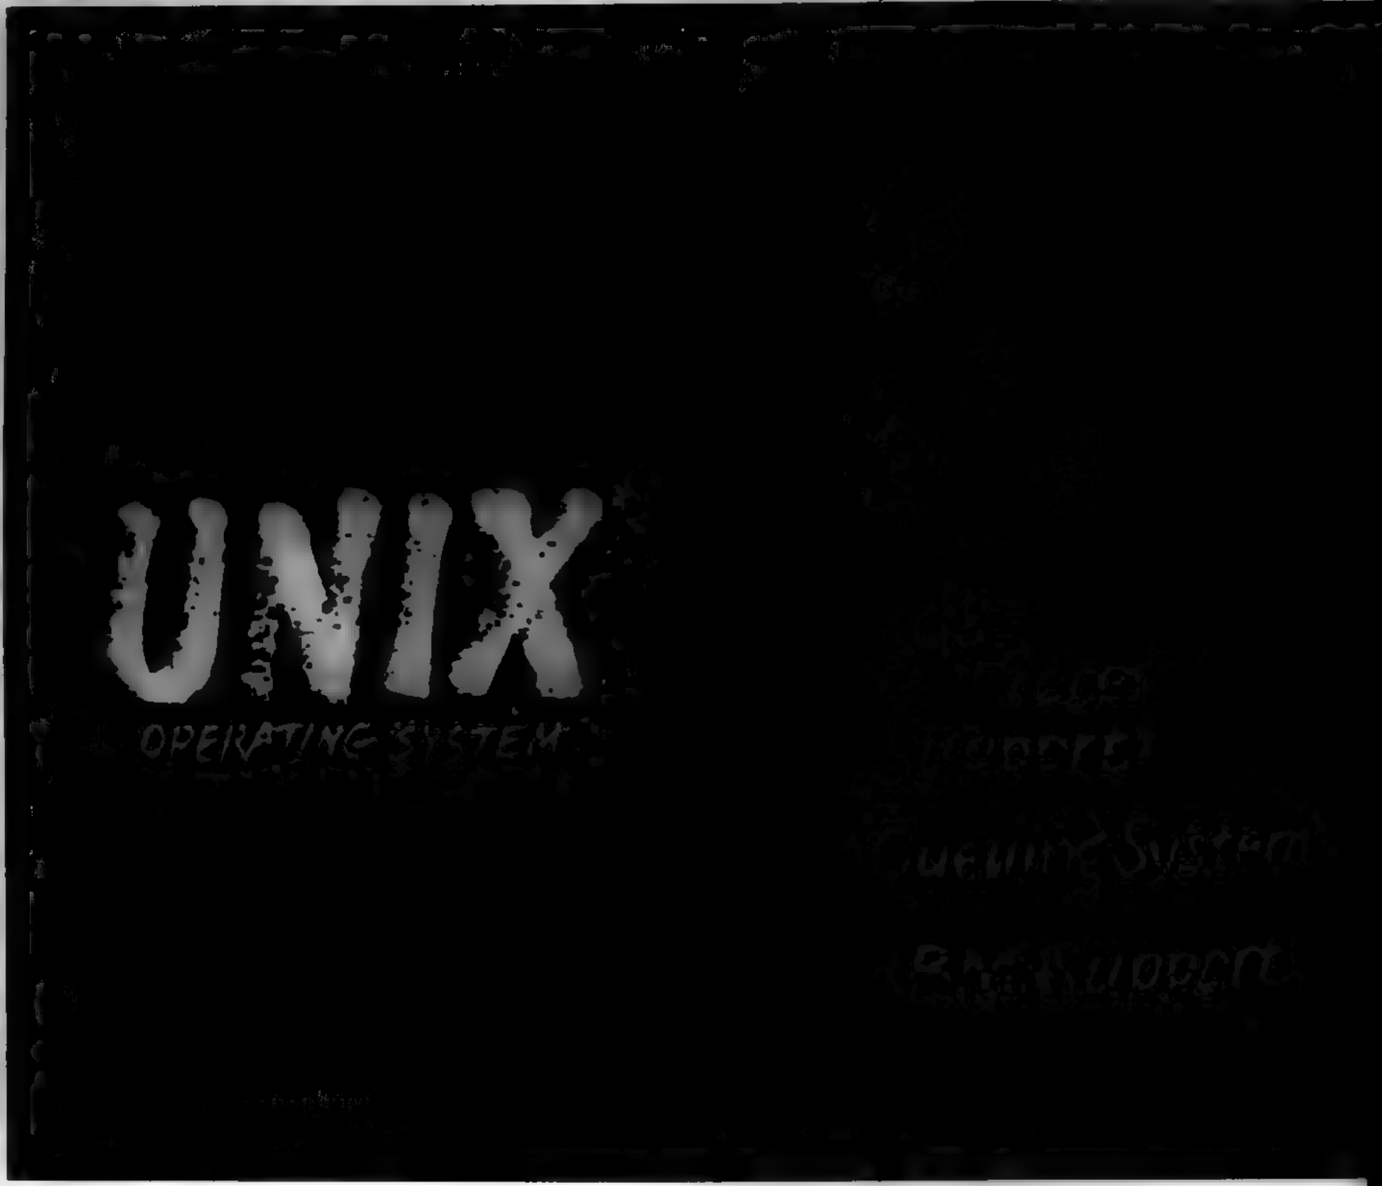
A user in an accounts payable department, for example, might require access to accounts on a region-by-region basis. If the professional computer is a stand-alone system, the information must be obtained by phoning or visiting the appropriate personnel, resulting in time and productivity delays.

On the other hand, a professional computer in host workstation emulation mode can electronically access that information quickly and easily.

In addition to host workstation emulation, a tremendous amount of communications flexibility is required by the end user. Information of all forms (data, text, graphics, image, voice and integrated combinations of these five) should be electronically transferred among devices within a system, among systems within a local or remote network and among multivendor systems.

The better professional computers emulate not only system workstations manufactured by their own vendor, but also those manufactured by competitors. Some professional computers on the market today can emulate system workstations from as many as three or four competitive manufacturers.

Multifunction workstation professional computers should support a wide variety of local and remote communications options, including asynchronous, binary synchronous, IBM's Systems Network Architecture and



Now you can have a complete UNIX System III implementation on most models of the IBM PC.

The IBM Personal Computer Interactive Executive† (PC/IX) offers you tools like the C language, programmer's workbench, communication facilities, a text processing system and much more. It's also a multitasking system that offers you the same facilities found on larger UNIX operating systems.

And PC/IX incorporates many significant enhancements. For example, a new full-screen editor helps you program more effectively. It offers such advanced features as windowing, function-key editing, the ability to execute commands from the editor, and automatic file backup. Beginning users of the editor can rely on a variety of "help" screens.

If you've been using PC DOS, you'll be glad to hear that it can co-reside with PC/IX. And that you can transfer files between the two systems.

PC/IX is specifically designed to take full advantage of the architecture of the IBM PC.

It transparently supports the 8087 Math Co-Processor. And PC/IX automates the management of input/output streams through a multipurpose queuing and spooling system.

IBM has other software for PC/IX

teletypewriter emulation. When purchasing professional computers, a corporation should obtain a firm directional commitment from the manufacturer to a specific type of local professional computer or multifunction workstation network, whether it be baseband, broadband or twisted pair.

If a corporation wants to connect professional computers in a single department, a baseband network will suffice. However, if the requirement is to connect many departments' groups of professional computers, as well as facilitate additional corporate communications needs, a broadband topology will allow the required multiple communications concurrently on separate channels.

In addition, if a corporation is investigating PBXs (or twisted pair), its professional computer vendor should have a clear directional statement allowing groups of professional computers to exchange information where PBX networks are installed.

There also need advanced file handling capabilities, such as the ability to convert automatically and transfer document files from one system format to another so they are usable at both ends. Filing and archiving functions allow common or private storage of files anywhere in the network. With file sharing, MS-DOS data files from the professional computers can be stored on a larger host and accessed by other professional computers.

Office information processing requires workstations that can participate in file management systems, allowing users a transparent means to distribute and retrieve documents on the network.

Multivendor setting

Few companies will rely solely on a single vendor for all of their office information processing needs. A workstation existing within a multivendor environment, therefore, should be able to do the following:

- Run programs using industry standard operating systems, such as Microsoft Corp.'s MS-DOS, IBM's PC-DOS, Digital Research, Inc.'s CP/M 86 and AT&T's Unix.
- Have program portability by using industry standard programming languages such as Basic, Cobol, Fortran, Pascal and C.
- Offer ease of text creation, editing and communications through standard document formats and communications protocols.

Multifunction workstations have to operate as part of the total corporate information processing solution, providing the user with concurrent access to a variety of tools.

Above and beyond the personal stand-alone processing functions, such as integrated word processing, spreadsheets and business graphics, multifunction workstations should handle information management tasks, such as electronic mail for delivering, receiving and responding to mail and phone messages, and time management tasks, such as a convenient notebook, "to do" lists and calendar function. It is extremely important that today's workstation integrate stand-alone, host workstation and communications tasks.

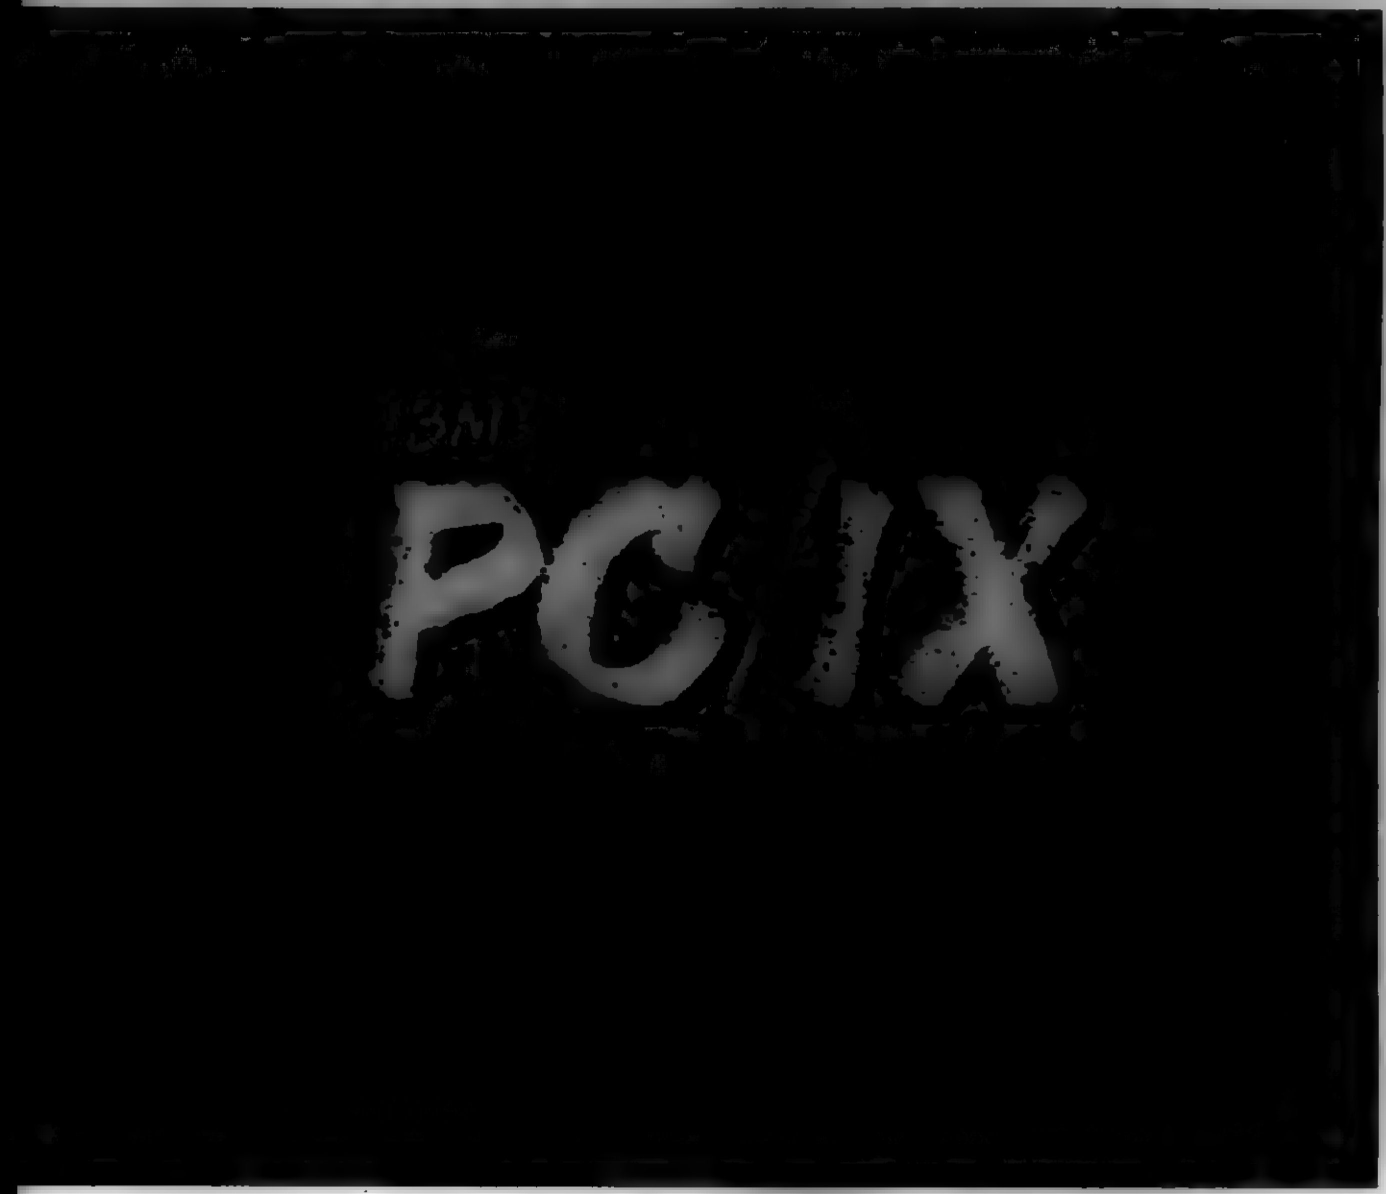
Products such as Microsoft's MS-Windows, Visicorp's Visi On and Digital Research's Concurrent DOS have brought the concepts of windowing and concurrent operation of multiple programs and access to multiple host data bases to the forefront of professional computer technology. Windows enable professional computer users to integrate different types of information quickly and easily from various sources. A word processing memo, for example, can incorporate facts and figures from a host data base, portions of a spreadsheet and a graph, with just a few keystrokes or the movement of a mouse.

Path to new technologies

A multifunction workstation must be fully hardware- and software-upgradable in order to protect the corporation's investment. A user should be able to buy a professional computer with just the amount of functionality necessary to do his job today, with the full assurance that as job requirements dictate greater functionality and as technology changes, his workstation can be easily upgraded.

Upgrading means adding functions, not replacing equipment.

New technologies such as voice, image and multiuser



available, too, including INfort (a FORTRAN compiler with programming tools) and INmail/INnet/FTP (an electronic mail and file transfer facility).†

And because PC/IX is from IBM, you get IBM's quality documentation, as well as IBM service and support.

PC/IX requires 256KB of memory on an IBM PC with fixed disk or an IBM PC XT, PC XT/370 or PC AT.

You'll find PC/IX at your nearest IBM Product Center or your Authorized IBM Personal Computer Dealer. To order, or for more information and the latest list of PC/IX application software, call IBM toll free at 1 800 IBM-2468, and ask for the PC Software Department, Ext. 90. Or call your IBM marketing representative.

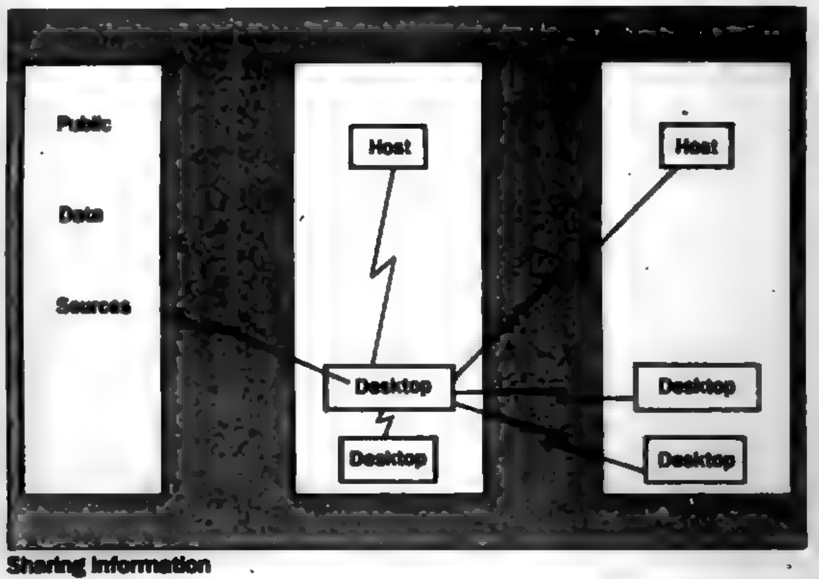
*UNIX is a trademark of AT&T Bell Laboratories. PC/IX is based on UNIX System III, which is licensed to IBM by AT&T Technologies, Inc.
†Developed for IBM by INTERACTIVE Systems Corp.

The industry is quickly moving to the time when a multifunction workstation will be plugged into the wall as part of an end-to-end, truly digital network.



Sharing Information

and multitasking information processing environments are enhancing the personal computer industry today. A Wang Professional Computer, for example, can be upgraded to a Wang PIC image processing system that allows a high-resolution digitized image to be combined with text.

With image processing, images — whether they be handwritten notes, drawings, photographs or other forms of information — can be displayed, stored and edited as if they were text. They can be moved, copied, made larger or smaller, darker or lighter. The combined image-text document can then be printed by high-quality thermal or laser printers. They can be distributed as messages or mail and viewed on professional computers that do not have image scanners. As much as 90% of the paper input corporate professionals receive in their day-to-day operations is visual — forms, reports, graphs, proposals and so on — and was not amenable to computer automation until state-of-the-art image processing developed. Through PIC, users can also annotate this image-text document with digitized voice and then send the annotated document to one or more users.

Images captured at a professional computer-based workstation have to be treated as data and tied in with various local and host data base managers. Office communications have to be enhanced with the ability to record, store and forward voice messages on professional computer-based workstations.

Built for heavy use

In addition to the six requirements, multifunction workstation components must be designed for heavy use and systems reliability within the office environment. They should be workhorses, getting the job done quickly, efficiently and accurately.

No time should be wasted converting information, changing formats or deciphering data.

Multifunction workstations should possess outstanding CPU performance. Windows, concurrent tasks and unstructured data such as image and voice require a high-performance microprocessor design, such as the Intel Corp. 8086 or 80286 chip. They should also have a modular growth path, with options and add-ons provided by the workstation vendor.

The professional computer is the ultimate multifunction workstation. It provides transparent access to all types of information, regardless of the kind of system it is on or its location. It also allows concurrent integration of multiple business applications, whether stand-alone or host-connected. Communications of multiple types of information (text, data, image and voice) is also easily facilitated.

The future will bring a system that is "invisible" — where office workers think only about what has to be done, not how the system will do it. The industry is quickly moving to the time when a multifunction workstation will be plugged into the wall as part of an end-to-end, truly digital network.

IS YOUR MICRO POLICY WORTH SAVING?

protect facilities from improper use. Such policies involve limiting the use of personal computing devices to experimental applications, isolating the facilities to prevent unauthorized use and restricting their operation to authorized persons only. Generally speaking, responsibility for security of data resources is placed directly upon user management, much as that group is held responsible for other valuable or confidential assets.

2. Data integrity. Management concern in this area takes the form of policies that tend not to limit physical access to end-user facilities, but rather to specify the conditions under which these facilities may have access to the mainframe, the data base or the communications network. Implementation of such policies is almost universally the responsibility of the management information systems organization and is built into the systems programming and operating procedures of the mainframe computer/communications system.

3. Compatibility of hardware and software. Management recognition of the need to move in the direction of integrated systems is evidenced by the many policies intended to promote compatibility of end-user hardware and software. They are most frequently implemented through procurement guidelines and approval procedures that are the responsibility of the MIS organization.

4. Justification of cost. Corporate policies involving expenditures for personal computing generally extend beyond the normal financial justification requirements. In addition, such policies require justification of the feasibility and appropriateness of the application from a systems viewpoint. This additional justification is usually the responsibility of user management in consultation with the MIS organization.

Utilizing the resource

Beyond these management concerns, what needs to be considered is the overall challenge of effectively managing the growth in the use of these resources and the rapidly expanding number of users.

An essential first step is recognizing that we cannot afford to accept this phenomenon as simply the growth of a costly inventory of equipment. This growth must be managed to ensure that the varieties of equipment used adequately support individuals in their current jobs, promote compatibility and generally use the resource as efficiently as possible.

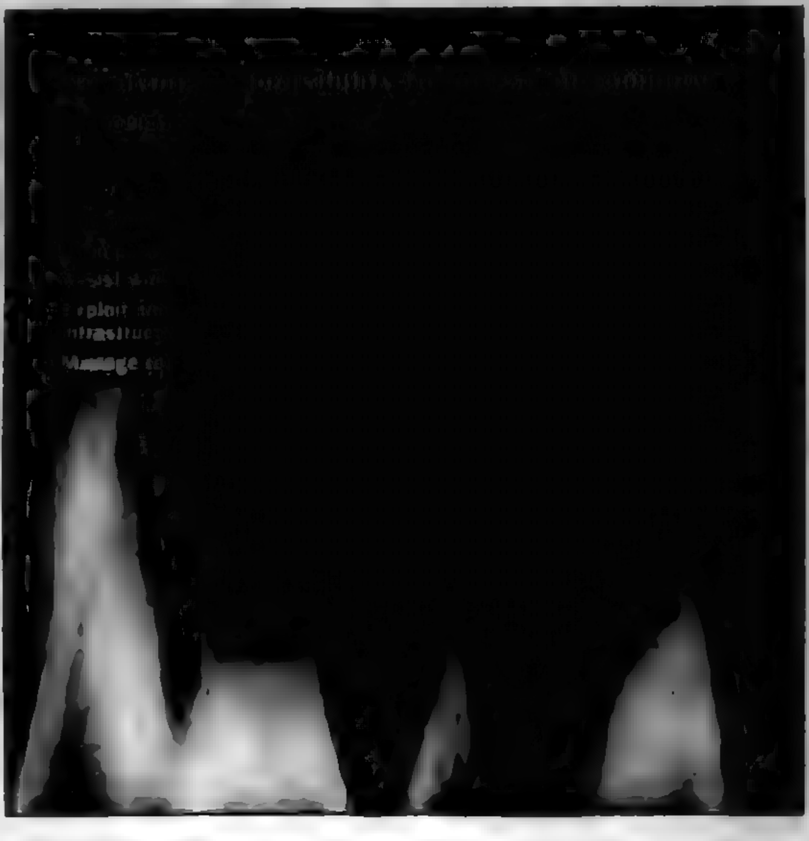
Organizations must look at the proliferation of personal computing equipment as a basis for building an information infrastructure that will support office automation as well as management decision making. To illustrate: As more and more terminals are deployed for decision-making support, the opportunities to use them for distribution of documents, for videotex and similar facilities become more meaningful, offering significant savings opportunities in terms of time, internal publishing costs, mail distribution and other office operating expenses.

In terms of costs, the goal of efficient deployment and utilization of resources is very much in tune with the larger goal of building an infrastructure. However, the importance of this objective must be recognized, because in some cases, developing an effective infrastructure will appear to cost more initially than allowing unguided proliferation of equipment.

Management concern must exist for several areas not yet recognized in day-to-day policies.

1. Support of work groups. A basic consideration is the need to distinguish between support for individuals and support for groups or departments, where the presence of an information infrastructure is particularly important.

For example, consider the office of a shipping distribution center, where the dozen or more order tracers in the office might require access to mass storage and communications linkage to points within the shipping center and to external sales offices as well. This group might effectively use a document generating and distributing system, an electronic mail system and a local data base system as part of the information infrastructure. It might be supported by nonintelligent terminals linked to a minicomputer.



2. Support of leading users. A major area of concern must be the identification and support of individual users whose work or work style turns them into "leading users." In that same shipping center, one shipment scheduler may emerge as a leading user who can benefit from sophisticated capacity planning, order sequencing and other quantitative approaches. Such an individual might benefit from a relatively powerful personal computer with extensive internal memory and graphics capability.

At some point, certain individuals will become heavy users of the computing resources, and it will become apparent that their own productivity and the effectiveness of the functions they perform can be further enhanced. These are the people who, in the normal range of applications, suddenly seem to need more or different resources.

To support such individuals effectively, it may be necessary to isolate their potential needs and capabilities, to determine their special requirements for additional resources and to evaluate the extent to which they can act as focal points for enhancing other activities within the organization. Applying and cost justifying additional support for such leading users is a major improvement opportunity.

3. User management involvement. Most companies simply do not have the resources to monitor and closely manage local use of computing resources. Typically, one staff specialist will support between 100 and 200 users, and most of this support is hand holding and trouble shooting, not monitoring day-to-day applications.

Attention needs to be given to working with user management to protect and enhance applications that become key to the workings of the department — particularly where perhaps only one or two individuals understand how to use the application. Further management attention is necessary, on the other hand, to avoid situations in which critical activities are exposed to unnecessary risk through improper use of the facilities.

A case can be made that support for most individuals will necessarily have to be limited to a basic level, with additional support provided for some advanced people. In addition, in each work group it is essential to search out opportunities to enhance the productivity of the whole group by creating an effective, cost-justified infrastructure of office automation utilities.

In most cases, the initial demand for such primary utilities as spreadsheets, word processing and electronic mail will provide sufficient benefits to justify creating the critical mass of users, applications and resources that provides the infrastructure upon which more advanced office automation and decision support applications can be built.

Dual responsibility for support

As end-user computing grows, it requires more than one kind of support. As MIS management considers support of the work group and support of individual users, it becomes a real question as to what people and computing resources should be made available.

While MIS operations, traditional applications development and the telecommunications function will increasingly be involved in supporting end-user computing, the key leverage points appear to be office automation and the information center. Currently there is a trend toward putting these functions under a single individual, but it is important to understand that office automation and the information center make distinct contributions.

Both the office automation group and the information center have legitimate involvement from different perspectives. Companies should be looking at ways of sorting out these two functions.

Supporting work groups with common utilities appears to be an office automation function that involves studying work and information flows to develop support activities such as electronic mail, document processing and other communications-based services. Support for individuals is more applications-oriented and may fall into the information center arena.

Essentially, the information center provides an environment in which the user can deal with the MIS department. There is, however, considerable variation as to how information centers are operated. Basically, they have grown up in two ways:

- One is along the lines of what we can call decision support — working closely with individual end users to develop applications suited to their particular decision-making needs. This approach typically uses mainframe-based data and systems already in place.
- In other organizations, information centers have grown up as a convenient way to disseminate and support personal computing. The information center was conceived as a place where people can walk in and try out different kinds of personal computers to familiarize themselves with the hardware and the basic software for such applications as spreadsheet preparation, text editing and data base manipulation.

As the population of end users increases, it is unlikely that the information center will provide the locus of a great deal of day-to-day support for most people. Basically, they will be independent of it, using various utilities provided to them. Continuing low-level training will properly become embedded in the user organization through its own people. Increasingly, the information center will tend to specialize in the areas of new applications and new tools for application, leaving much of the utilities development and support to the office automation group.

The long-term benefits of personal computing will only be realized as it becomes embedded in the organizational culture.

In order to succeed with the limited resources available to MIS, user management must assume increasing responsibility for primary training, for organizational learning, for identifying potential applications and for assuring that use of available tools falls within the parameters of responsible management.

David Dell is director of research services at the Diebold Group, Inc., an international management consulting firm based in New York.

HOW TO KEEP UP WITH NEW SOFTWARE

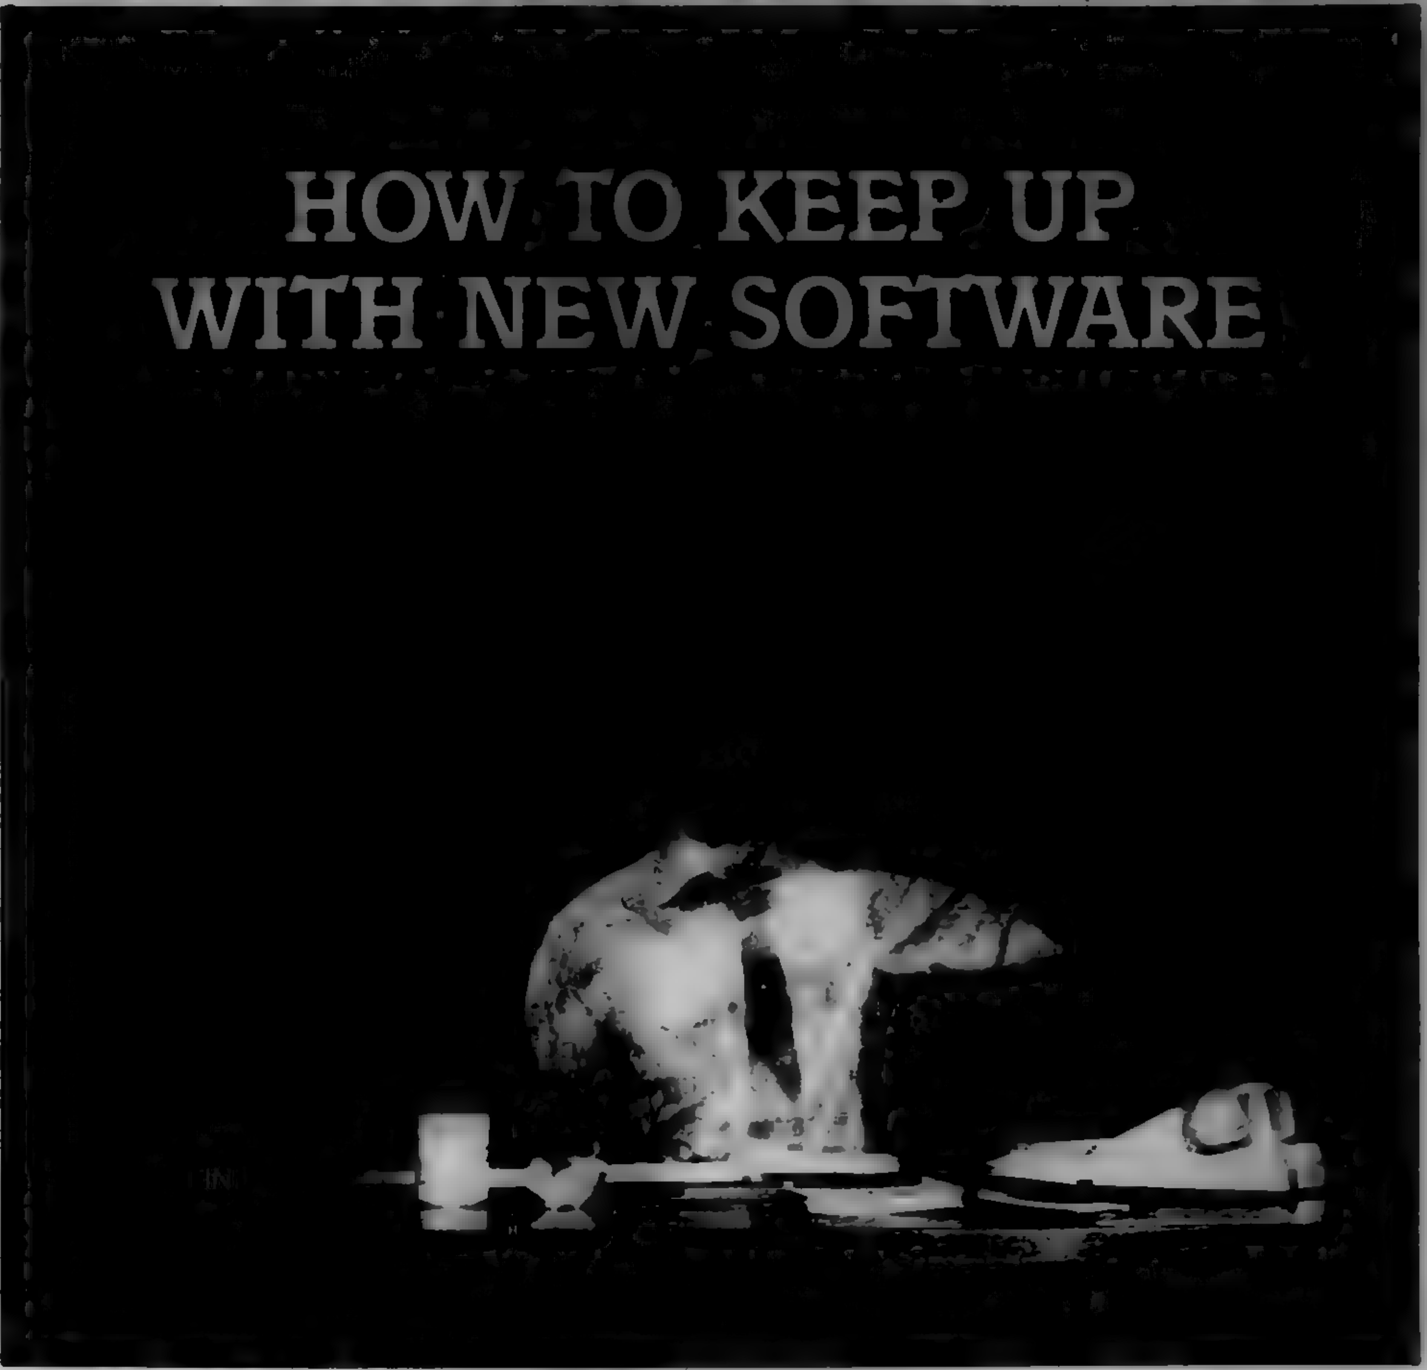


PHOTO ©1984 ED BRAVERMAN

By Richard Strauss

Every month, 100 or more software products are introduced for the personal computer. Keeping up with what's available is like bailing out a rowboat with a thimble.

It's desirable, of course, to collect whatever information comes your way — and an especially good idea to keep files of software articles and reviews clipped from magazines. But rather than trying to keep up with all software developments, the bulk of your research efforts should be centered around specific needs within your organization as those needs arise.

Once you know what you're looking for, there are two approaches to finding it: Do it yourself or get help.

The first involves collecting all the product information you can and then making a selection. Since you do all the legwork, this method can be extremely time-consuming. If you are thorough, however, you are in an excellent position to make the ideal selection.

Getting help involves a middleman who collects and screens product information, then presents you with a narrowed field of products and a recommendation. You never look at products that for one reason or another have been disqualified. The final decision is still yours, but you have less to think about in arriving at your decision.

If the middleman does a good job of screening, getting help is clearly the more efficient way to search for a product. But if the middleman is biased or otherwise fails to consider the full range of products available to meet your needs — or if he doesn't understand your needs — you might be better off doing it yourself (if you have the time, of course).

Regardless of which method you choose, you have to get your information from somewhere. If you do it yourself, consider the following sources: books, directories, software reviews, magazine roundups, software reports, advertisements, vendors, trade shows, retailers, associates and friends.

Books. Most bookstores carry guides for selecting products in the more popular categories. The books written by a research staff are generally less biased than those written by a single author, but in either case you can pick up some good information about the products you are considering.

The problem with books is that they usually do not have the latest products, and many of the less popular categories don't have any books at all. Another problem with books is that they can be misleading because they often draw conclusions about the products that don't take into account the way the products will be used in your organization.

But if you can find a book that covers the area you are investigating, it's a good start for getting an insight into the pros and cons of the products in that area. It's also a good way to learn about the benefits of the software in general.

Directories. Most directories list a wide range of products with a paragraph or two describing each. These descriptions are usually summaries of the products' features or strong points rather than critical evaluations. A comprehensive directory is a good place to find out what products are available to meet your needs, but unless you are looking for special features, directories won't do much to narrow your choices.

Neither will they have the latest products. For example, one of the leading directories of personal computer software lists 75 word processors — but does not mention three of the newest and best: Office Solutions' Officewriter, an excellent word processor; IBM's Displaywrite, a word processor that emulates the Displaywriter; and Leading Edge Products, Inc.'s Word Processor, a package with the power of a dedicated word processor and a competitive price.

Besides directories in book form, there are electronic directories that provide product information on-line. The information is more up-to-date than in book directories, but it is also more expensive — and you need a personal computer with communications capabilities to provide access.

Software reviews. The software reviews published by computer magazines can provide insight into particular products, but you should not rely on them to make your selection. Reviewers generally write from a limited perspective — they don't consider the full range of the product's potential uses or the various types of people who might be using the product.

If the people in your organization will be using the program differently from the way the reviewer uses it or if your organization's level of experience with the product category is different from that of the reviewer, the review probably won't be highly relevant to your search.

On top of that, it's not unusual for reviewers to have a bias in favor of the products they review. And most reviewers do not compare the product with others in its category.

Thus a product that gets a good review isn't necessarily the best — or even good — for your purpose. The review does, however, give you a feel for the product, and any negatives in the review should be considered red flags.

Magazine roundups. Many computer magazines carry articles about specific categories of software (in addition to software reviews).

These articles are of two basic types: buyers' guides and feature articles.

Buyers' guides cover particular software categories accompanied by charts listing features. These guides are like directories: They tell you what products are available and what features they have, but they usually don't help the reader much in narrowing his choices.

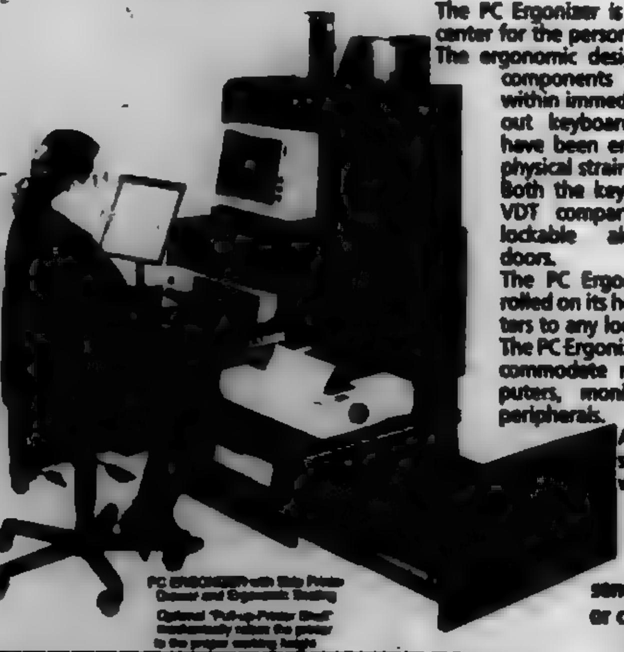
Even if a product is shown as lacking a special feature you are looking for, don't be too quick to rule it out — the charts in magazine roundups are notorious for errors.

Feature articles concentrate more on text and less on charts of features. They talk more about the overall benefits of the software and less about particular products.

To make a feature article manageable, the author may eliminate certain products in the category. For example, a recent article on project management software overlooked Softcorp, Inc.'s Pro-ject 6, a relatively new, highly capable, inexpensive program for projects of medium complexity. Another article on project managers ignored products selling for more than $500 — which elimi-

A comprehensive directory is a good place to find out what products are available, but unless you are looking for special features, directories won't do much to narrow your choices.

THE NEW PC ERGONIZER,™
EVERYTHING AT YOUR FINGERTIPS,
AT A PRICE WELL WITHIN YOUR REACH.



PC ERGONIZER with Side Printer Drawer and Ergonomic Seating
Optional "Pull-up-Printer Shelf" mechanically raises the printer to the proper working height

The PC Ergonizer is the ultimate workcenter for the personal computer.

The ergonomic design puts all systems components and workspace within immediate reach. The pull-out keyboard and workshelves have been engineered to relieve physical strain.

Both the keyboard and optional VDT compartments come with lockable aluminum tambour doors.

The PC Ergonizer can be easily rolled on its heavy duty carpet casters to any location.

The PC Ergonizer is designed to accommodate most personal computers, monitors, printers and peripherals.

All in one attractive, superbly constructed workcenter.

Meet SAGEPC™

Total Micro/Mainframe Communications
Plus Tektronix Color Emulation for only $395.00

Now you can use your IBM-PC or PC-compatible to access mainframe graphics and data bases; transfer mainframe generated visuals and files; originate state-of-the-art PC-to-mainframe and PC-to-PC communications quickly and less expensively than ever before.

SAGEPC brings you total communications capabilities in one powerful, completely integrated software package that:

- Converts your IBM-PC or PC-compatible into a mainframe color graphics terminal for easy access to and use of all mainframe graphics software;
- Permits off-line storage, previewing and plotting for error-free reproduction;
- Allows automatic, sequential recall and review of color graphics for PC-screen, presentation slide shows;
- Includes automatic dial-up and log-on communications with any mainframe or PC for electronic mail;
- Allows simultaneous, bidirectional transfer of data files and graphics to and from the mainframe;
- Provides full-screen editing capabilities for pre- or post-transfer file creation and formatting.

SAGEPC is fast, menu-driven and easy to use. Simply put, it is the most advanced mainframe/IBM-PC link available. To order, or for more information, return our coupon or call (609) 924-3000.

Mr. Richard Dym, Director of Marketing
SAGE DATA, Inc.
104 Carnegie Center
Princeton, NJ 08540

Yes, I'm interested in the advanced capabilities of SAGEPC.

☐ Please send me more information.
☐ Enclosed is my purchase order/check for $395.00 for each SAGEPC license. I understand there is a 30-day, money-back guarantee.

nated two of the most capable programs for the professional project manager: Applied Business Technology Corp.'s Project Manager Workbench and Primavera Systems, Inc.'s Primavera Project Planner.

Software reports. A number of firms publish the equivalent of *Consumer Reports* for software. One is *Software Digest*, a periodical that reviews a different software category each month. A wide range of products is evaluated in each category, each product is examined by several evaluators and all products are judged by the same criteria.

As opposed to magazine reviews, *Software Digest* presents a collective opinion rather than an individual one and makes it easy to compare most of the products in the category.

There's a serious problem with software reports, however. Like the software review, they fail to consider that various users will be using the software for varying purposes — and what may be a good program in one instance may be totally inappropriate in another.

For example, in the data base category, *Software Digest* gave the No. 1 ranking to Powerbase Systems, Inc.'s Power-base, while Microrim, Inc.'s R:base 4000 ranked 15th. The two programs are as different as their rankings — but the difference is not their degree of desirability. Both are relational data base managers, but Power-base is a fill-in-the-blanks program and R:base is command-driven with a procedural language. Power-base is easier to learn, but R:base is more powerful. A middle manager setting up his own relational data base system would choose Power-base, while a programmer designing a sophisticated turnkey system would much prefer R:base. Reports like *Software Digest* simply do not provide the information to allow these distinctions to be made.

If you rely on ads to tell you what's available, you will miss a lot of products from smaller companies.

Software reports are best used to identify available products and to raise red flags to investigate further. If you know exactly what features you need in a program, reports are good also for preliminary product screening — but not for drawing final conclusions.

Software reports are best used to identify available products and to raise red flags to investigate further.

Advertisements. Software ads in newspapers and magazines can alert you to the existence of products and give you a rough feel for them, but they do little to help you compare the software with other packages you are considering. Ads don't even tell you what applications the products best suit, because vendors seem to think their products are best for all applications.

Advertisements are a good indication of what companies have the best financing, not necessarily the best products. If you rely on ads to tell you what's available, you will miss a lot of products published by smaller companies that do not advertise. Two examples of quality unadvertised products are Evergreen Software's PC-Calculator, a program that turns a computer into a sophisticated "pocket" calculator, and Applitek, Inc.'s DOS Commander, a utility that simplifies the use of IBM's PC-DOS.

Vendors. The best thing about advertising is that it tells you how to get in touch with another source of information, the software vendor. If a product appears to warrant further investigation, it is worth a call to the vendor to see if you can get a demo disk or evaluation copy.

Evaluation copies are usually full working copies of the program, and they give you the advantage of testing the software in your own working environment. You probably will not be able to talk a vendor into sending you an evaluation copy if you plan to buy only a single copy, but if you intend to make a large purchase, you have a good shot at getting one.

Trade shows. Attending computer trade shows can be an effective way of seeing what is available and at the same time getting a feel for the products on display. Although shows will not give you much hands-on experience, they are a great opportunity for requesting evaluation copies for your testing when you get back to the office.

If a program you are considering is a hot new release, don't expect to find out much about it at the show — unless you are very aggressive in fighting the crowds around you. You are better off concentrating on making a contact that can supply you with information after the show is over.

As with magazine advertising, you will miss a lot of small but important

Warm up to

PC/RESERVE™

Anytime. Anywhere. On-site or overnite.

PC/RESERVE offers prompt, professional on-site service and support by more than 1100 technicians coast-to-coast. Optional blanket coverage can protect you 24 hours a day, 7 days a week.

Or, PC/RESERVE can replace your failed equipment with an identical unit. Overnite. Nationwide. Guaranteed, whether it's IBM or any number of compatible peripherals.

PC/RESERVE saves time and cold cash. We can design an on-site/overnite program that won't freeze your budget. If you don't want the cold shoulder next time your PC goes down, call PC/RESERVE today.

We support the IBM PC, IBM PC XT, IBM *Portable* PC, IBM PCjr, IBM 370 XT, IBM 3270 PC, IBM Personal Computer AT™ and many compatibles.

Anytime.
Anywhere.
On-site or overnite.

IBM is a registered trademark and IBM Personal Computer AT is a trademark of International Business Machines Corporation.

™ Trademark of International Business Machines Corporation.

programs if you rely on trade shows for your information. For example, Kensington Microware Ltd.'s Remote Control is not at the shows, but it nevertheless is an excellent product for connecting your lap-size computer to an IBM Personal Computer. Eastern Software Products' LP-88, a linear programming package, is another important program absent from the shows.

Retailers. You can get a lot of good product information from a software retailer — if he carries the products you are considering. Sales representatives are glad to give you a product demonstration or let you sit down at a machine with a demo disk, but don't expect to walk into a store and compare half a dozen products that are in the running for your final selection. Retailers tend to concentrate their efforts on just a few products in each category, so the retail store is not the ideal place for comparison shopping.

> The first thing to consider in hiring a consultant is where he gets his information.

In fact, there are some categories of products that the retailer does not stock at all. Some manufacturers do not consider the retail store an appropriate distribution channel. For example, if you are considering SPSS, Inc.'s SPSS/PC — the most powerful statistics program for the IBM Personal Computer — you won't find it at your neighborhood computer store.

Other products are simply too expensive to be carried by retailers. Execucom Systems Corp.'s IFPS/Personal, for example, sells for $1,500. Its price keeps it out of most retail stores, yet it is a top-notch financial modeling package for corporate use.

Associates and friends. There's nothing wrong with word of mouth for judging software. Anyone who has used a product you are evaluating can provide valuable information.

But consider the source: If the person uses the product in a way that's different from how it will be used in your organization, take his comments with a grain of salt. Also ask him what other products he looked at before buying the one he's using. He may have missed the one he should have bought.

Now that you have collected all this information, what do you do with it? There's no magic formula — you just put it all together and decide which product looks best in light of how it will be used in your organization. Or you could take the second approach for screening products: Get help.

There are two primary sources of information for getting help: software consultants and specialized software distributors.

Software consultants. The first thing to consider in hiring a consultant is where he gets his information. As the discussion here indicates, information can come from a variety of sources, and gathering it is time-consuming. Ideally the consultant will have similar assignments from other clients so that he can realize some economies of scale in conducting his research.

Consultants are expensive — but so is your time. If your consultant is doing his job, he is probably worth every penny he charges.

Be on guard if the consultant spends significantly less than full time evaluating personal computer software. In fact, keeping abreast of software developments is more than a full-time job; covering the range of software categories requires several people. If your needs cut across several product categories, you probably need a research organization rather than an individual.

The biggest danger in using a consultant is paying an arm and a leg to come up with an adequate but not superior solution to your software problem. Consultants, like everyone else, tend to have a bias toward the products they already know — and they may overlook the best product in favor of the one they know best.

On the other hand, a consultant who is doing his job will take the time to learn

SURPRISE. YOU JUST TURNED INTELLIGENT PCs INTO DUMB

PROTOCOL. THE END OF THE DP

The biggest danger in using a consultant is paying an arm and a leg to come up with an adequate but not superior solution to your problem.

your needs, then systematically weed out the products that are inappropriate and present you with only the winners — along with a recommendation.

With only a few products to consider, you will not be distracted by an array of product features and claims. Your final decision will be far easier.

Specialized software distribution. There are a few relatively new companies that specialize in selling software directly to large companies. Those with in-house product evaluation staffs can provide the same services as a consultant. They narrow the field of products and present you with recommendations.

The process used by these distributors is less personal than that used by a consultant because the initial screening of products is made without a specific customer in mind. My company, for example, is a specialized distributor based in Waltham, Mass. Corporate Software, Inc. has an evaluation staff that screens thousands of products. The programs that survive the screening process — about 2% of those evaluated — are the ones that meet a need likely to be found in a large company.

Some specialized distributors publish the results of their evaluations. Corporate Software provides information on the products it considers "winners" in *The Corporate Software Guide*, a quarterly publication currently containing evaluations of 200 products in 20 categories.

Besides narrowing your choices, a publication like this guide in effect provides product recommendations by suggesting the programs that are appropriate and inappropriate for various corporate needs.

If you need further information, the distributor's staff can answer questions and provide demo disks and evaluation copies.

Although a specialized distributor can be valuable in helping you match products to needs, it cannot provide the personalized service necessary to define your needs in the first place. For example, if you are not sure whether presentation graphics software is a cost-effective alternative to your graphics department, don't look to a specialized distributor for a cost-benefit analysis.

But if you know that you need software and you know what you want it to do, a specialized distributor can go a long way toward helping you find it.

A word of caution: Specialized distributors target large corporations. If you are a small business, you may not qualify to receive the assistance these distributors provide.

Having described the two approaches for gathering information, we suggest you use neither exclusively but rather a combination of the two.

Doing it yourself is good for gaining an overall familiarity with the various software products that are relevant to your business, and getting help will save you time in narrowing the field. Once you've identified the finalists, go back to your own sources for help in making the final decision.

And let someone else worry about bailing out the rowboat.

■

Richard Strauss is vice-president, products, for Corporate Software, Inc., a Waltham, Mass., distributor that specializes in supplying personal computer software to large corporations.

ALL OF YOUR TERMINALS.

It's a classic DP nightmare.

Your company just spent a fortune to buy PCs, and put all that processing power on people's desks. Now it's your job to give those PCs access to your mainframe.

Here's where something horrible happens.

The host communications board you add converts your smart PCs into dumb 3278 terminals. Terminals that can only handle one task at a time. Terminals with none of the intelligence and processing power you paid for in the first place.

Is there no end to this nightmare?

INTRODUCING PCI-LINK.™ THE FIRST SMART WAY TO LINK AN IBM PC TO AN IBM MAINFRAME.

Relax.

Now there's PCI-Link™ from Protocol Computers. The first add-on communications board that doesn't turn a smart PC into a dumb 3278 terminal.

With PCI-Link, your PC can access an IBM mainframe, and virtually any other ASCII device—computer, microcomputer, public network or LAN—simultaneously. You can even view and compare data from different sources in up to four windows.

Result? A multi-task workstation that combines the power of IBM 3270 communications with the intelligence of the PC. Plus complete file transfer capability.

What's more, PCI-Link delivers special, exclusive features that make it the smartest communications board you can buy. Like an on-screen floating calculator and electronic notepad. Pop-up menus for ease of use. 3278 keyboard mapping options. User defined macros. Even a special status line in addition to the standard IBM 3278 status line.

And all of PCI-Link's power and functionality is mouse supported.

Is that smart or what?

FOR MICRO TO MAINFRAME COMMUNICATIONS, NO ONE TALKS TO IBM LIKE PROTOCOL.

PCI-Link is just one reason why Protocol Computers is the leader in communications technology.

In 1980, we introduced the first successful protocol converter. And today, PCI is the only single resource with a complete array of mainframe access product technology. Advanced protocol conversion boxes. Communications boards. And powerful support software.

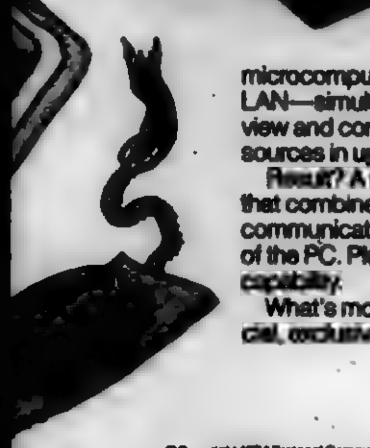
So we can help you connect virtually any ASCII device to an IBM mainframe with greater performance, less cost and positive security.

For complete technical information on PCI-Link and our full range of protocol converters, call Ron Ockander, V.P. Marketing, at 1 (800) 423-5904. Or just send the coupon.

Your DP nightmares are over.

With PCI-Link hardware and software your PC becomes a smart, multi-task workstation that gives you the power of IBM 3270 communications—plus more special features.

PCI PROTOCOL COMPUTERS, INC.



THE END OF THE DP NIGHT-MARE.

I want to wake up from the DP nightmare. Please send me my free "The End of the DP Nightmare" kit today.

NIGHTMARE.

By Eric Vogt

Software developers stand to realize sales of more than $14 billion over the next five years, market forecasters estimate. This prediction will hold up if — an this is a big if — developers get off the features bandwagon and shift their focus to the people who use the software.

Much of the personal computer software developed and marketed today emanates from the minds and practices of a clever few, rather than from thoughtful market research and testing.

To sell software in 1985, developers will have to realign their marketing strategies. Personal computer users, whose numbers continue to swell, are becoming more sophisticated, with more complex needs. The strategy of touting a single

* Symphony, while offering substantially enhanced graphics generation capabilities, shares with its predecessor, 1-2-3, the annoying necessity of booting a separate program for printing graphs.

Consider the [illegible] integrated software packages in terms of user and task [illegible].

Electric Desk from Alpha Software Corp. of [illegible], Mass., is a relatively [illegible] that integrates word processing, spreadsheet, data [illegible] and communications. According to [illegible], vice-president of [illegible] at Alpha, it was designed to be productive, intuitive and [illegible] to fill the needs of the [illegible] business user, who is [illegible] in results than [illegible] with unnecessary complications. A particularly attractive feature is its ability to act as an electronic Rolodex, placing phone calls automatically after locating a party using the data base function.

This package will find a home with administrative assistants, telemarketers and general managers because of its simplicity and strength in communicating.

Framework, the integrated entry from Ashton-Tate of Culver City, Calif., provides an interesting contrast to Electric Desk. It offers plenty of power, but requires greater commitment from the user. For instance, several of the keys have [illegible] functions in Framework [illegible] are unrelated to their [illegible]. In addition, the [illegible] approach to tasks or projects [illegible] adjustment.

Of particular [illegible] is Framework's ability to outline a [illegible] the appropriate [illegible] between modules [illegible] processing [illegible] sary for [illegible] Framework's [illegible] for the complete [illegible]

This package [illegible] range of users [illegible] alyst who is willing to unlearn spreadsheet technique, to marketing and human resources managers who will need to combine data base, analysis, communications with external data sources and excellent word processing. It is also a nifty tool for authors who need its outlining feature.

Without a doubt, the greatest amount of new [illegible] we saw was packed into Symphony, Lotus Development Corp.'s follow-up to the successful 1-2-3. In fact, the subtle improvements in the command structure of the spreadsheet portion alone argue for purchase of Symphony over 1-2-3 for any [illegible] number-crunching applications.

This is the tool of the financial modeler, not the general manager or administrative assistant. Its power, however, is [illegible] with occasional insensitivity to detail. The typing of [illegible] in a column to a spreadsheet [illegible] base is clumsy and [illegible] specify the column percent format for spreadsheet cells, the user must either move to it in the menu and select it with an ENTER, or actually enter a "%" (an uppercase 5). This requirement prevents the experienced user from quickly and easily formatting important information, such as return on investment.

There are several more minor pitfalls to user productivity in Symphony which have left many of us disappointed only relative to expectations that the package might eliminate all the [illegible] around 1-2-3 and present the same class of quantum improvement that 1-2-3 achieved over Software Arts, Inc.'s VisiCalc. [illegible] software package — even an "integrated" one — as appropriate for a variety of business users and their problem-solving styles won't work. Software developers must instead begin to understand and apply the concept of market segmentation.

Some argue that the software industry is simple and can employ record industry marketing strategies, albeit with more packaging and higher margins. Although this idea may at first seem humorous, the parallels are many: advertising on national TV, promoting a software author's or artist's personality to sell products, searching for new artists, negotiating contracts, priming the retail chains, designing an attention-getting package, fighting for shelf space and hoping for the hit. One can even draw parallels on the piracy issue.

When software is marketed as if it were just expensive records, a business user may spend more than $500 for a software diskette and end up feeling as though he has bought "Michael Jackson's Greatest Hits." But he gets only the drums and bass guitar parts. To produce the full value of his investment, he is expected to play lead guitar, sing and dance.

While this strategy works like a charm for Spinnaker Software Corp., Infocom, Inc., Broderbund Software and other companies whose products don't exceed a list price of about $49.95, as we move above the $50 mark in personal computer software, and particularly above $100, we enter another industry altogether. At these higher prices, we observe an industry in which the evolution and competitive dynamics are similar to those of the calculator industry.

Remember Texas Instruments, Inc.'s Datamath and the Bowmar Brain? Their software counterparts today are Ashton-Tate's Dbase II and Software Arts, Inc.'s Visi Calc. Hewlett-Packard Co. then came out with more features and a different user interface, analogous to Lotus Development Corp. 1-2-3's market entry. Even the great calculator war — during which the prices came down and suppliers scrambled to add features and flexibility, lower power consumption and increase speed — can be compared to Symphony's and Framework's appearances this past summer. Each package has flexible "DOS hooks" and the ability to be programmed for unusually complex and sophisticated applications.

Through the entire process, the people who earned consistent margins from calculator sales fell into three classes:

- Volume-oriented cost cutters: Casio, Sharp Electronics Corp.
- Market-oriented innovators: HP.
- Controllers of distribution channels: K-Mart Corp. and Sears Roebuck & Co.

Consider the opportunities this analogy defines for the next wave of software. Since the low-end limit of cost competition in software is clearly occupied by Freeware, one can dispense with this issue and focus on the opportunities in market-oriented innovation and distribution.

The essence of the market issue is embodied in two questions:

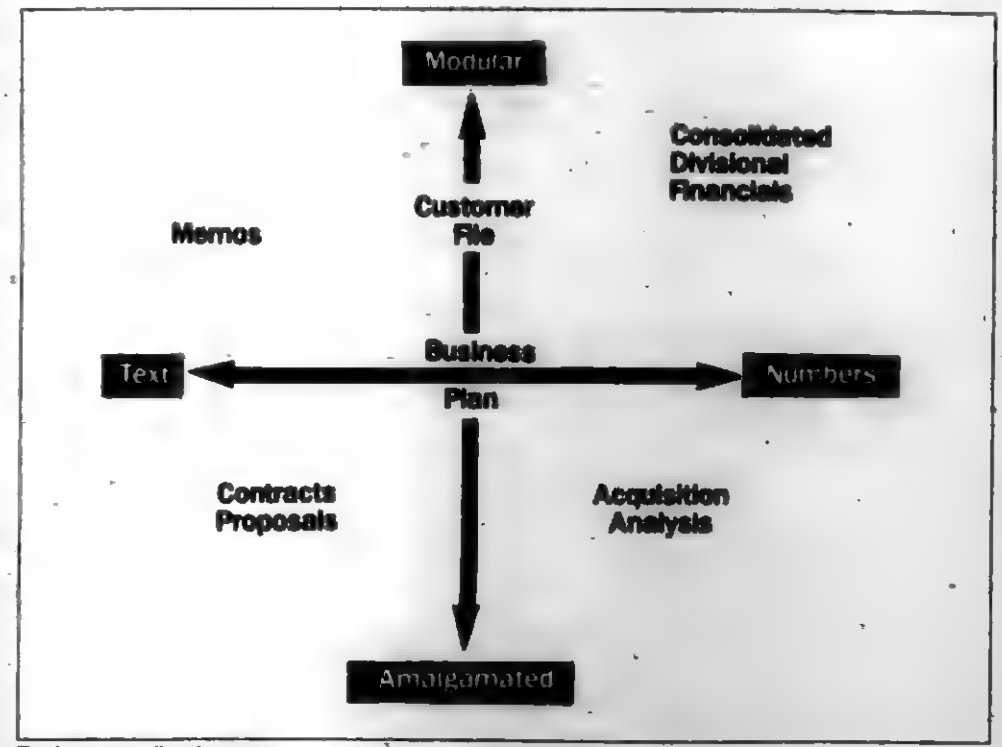
- Who will use this tool?
- What task will they try to accomplish?

Users may be grouped simply along two dimensions: degree of experience and, frequently, degree of need. For a software supplier, this structure can provide some guidelines with regard to the frequency level of on-screen reminders and the tolerance the user might have for multiple features.

In considering the universe of possible business tasks to be performed by the target population, the following questions must be asked:

- Will users work mostly with text or with numbers?
- Are the tasks modular, or do they naturally form one amalgamated problem?

From the software developer and marketer's point of view, a market segmentation in these terms clarifies the performance trade-offs that must be made during design and development. Large-scale numeric analyses will cry out to utilize an 8087 microprocessor, while pure text applications must grapple with the issues of random-access memory (RAM) speed with limited storage vs. constant disk access.



Business applications map

The era of the "across-the-board" software package is long gone. In fact, one might argue that some of the new integrated software products suffer from trying to spread themselves too thin across these divergent applications. A clear-cut needs analysis will identify those applications for which a tried and true stand-alone package, such as Software Publishing, Inc.'s PFS:File or Micropro International Corp.'s Wordstar might, indeed, solve the problem most efficiently.

As the user becomes more sophisticated, one might add a third axis to the matrix: access to other data, either external data (via modem) or internal data, residing in other disk files, for instance.

Lotus' Symphony and Ashton-Tate's Framework have answered this need by supplying communications software as well as the ability to move through DOS and attach other applications, such as Dbase III. These are marvelous tools, yet presenting these options to people whose tasks don't require them and whose experience makes them feel shy and unsuccessful could pose a barrier to wide-scale acceptance.

Ironically, as the software itself is showing a clear trend toward user and task segmentation, the evolution of distribution continues to lag, with what is essentially a single channel. The major retailers parcel out their limited shelf space (both physical and psychic) to those products for which they anticipate the best sales. Clearly, this channel is overloaded.

New entrants in the software market must revise their approach. The development process must, in the future, be driven not by the capabilities of technical personnel, but by a systematic investigation of conditions in the market. If they are to identify "windows of opportunity" in the software market, successful software publishers will not wait until the code is written to have their first contact with their users. Rather, they will turn to the users beforehand to direct their efforts.

In addition to the trend toward software with greater market focus, we expect to see successful personal computer software publishers developing new channels of distribution — perhaps channels that incorporate pieces of added value currently missing from today's offerings, for example, user education. Drawing on analogies from other industries, someone is bound to develop the "Avon" and "Tupperware" distribution channels as well.

Finally, once the new software is ready to ship, developers will no longer be able to delegate the selling task completely to the retailer. They will have to take on the marketing task themselves — a trend already evidenced by the advertising budgets of Lotus and Ashton-Tate.

But can a 30-second spot say enough about the relevant aspects of one of today's software packages? We think not. Developers, to fill this information gap and reduce demands on the retail sales representative, will increasingly include demonstrations and completed applications as part of their marketing efforts. Software houses will also intensify their direct competition for corporate sales.

In this environment, effective user education will assume an even greater role, both for the corporations depending on the productivity of the technology for their success and for the publishers depending on the rapid adoption and popularity of the software within the target market segment for their success.

Eric Vogt is founder and president of Micro Mentor, Inc., a Cambridge, Mass., company that provides executive-level instruction in the use of personal computers.

Give us your resume
We'll give YOU San Francisco!
Some people come to sail on the Bay, some to ski in the Sierras, and some to snorkle in Santa Cruz. But the professional climate is the real reason, and every bit as exciting.
There's nobody better qualified than CRG to introduce you to San Francisco. We've been here longer - over 10 years - know everyone in EDP worth knowing, and our list of client companies reads like the Who's Who of the business world. Right now, several of them are looking for help in MIS, and in sales and marketing in the computer vendor field.

AT

DON'T TAKE ON ANOTHER SMALL COMPUTER WITHOUT LOOKING AT THE BIG PICTURE.

Being a big company with big resources, we put a lot into our NCR PC.

But what *you* can put into our Personal Computer is just as important:

All the hits. Symphony.™ Lotus 1-2-3.™ WordStar.® The list goes on and on.

But the NCR PC doesn't just run all the popular software. You'll find the software it comes with is pretty popular in its own right.

Take NCR PAL and NCR TUTOR. (Might as well—they're free.) PAL uses sound and animation to get beginners started while TUTOR teaches more advanced users about the operating system. GW™-BASIC is also included. And our RAM-DISK

program allows you to access information up to 15 times faster than a floppy.

Without all this the NCR PC would still be an exceptional value, with special keyboard enhancements that make it easier to work with spreadsheets and databases, plus hardware standards way beyond industry standard.

Which is exactly what you'd expect from NCR.

Which is exactly why, when you look at the big picture, you're looking at NCR.

NCR Corporation, World Headquarters, Personal Computer Division, Dayton, OH 45479. (513) 445-7478.

NCR THE BIG, PERSONAL, COMPUTER COMPANY.

hardware) setting. The AT is the centerpiece of IBM's new PC Network — an offering that fits into the company's larger scheme to link all of its computer products.

Mix and match

The Personal Computer AT comes in two basic models, both of which can be easily customized. Model 68, priced at $3,995, has 256K bytes of installed random-access memory (RAM) and a single half-height, 5¼-in. floppy disk drive with 1.2M bytes of storage, four times the amount of the Personal Computer's 360K-byte floppy drive. Model 99 lists for $5,795 and features 512K bytes of installed RAM, the 1.2M-byte floppy disk drive, a combination serial and parallel board and a full-height, 20M-byte hard disk. (By comparison, $4,395 buys a Personal Computer XT with 256K bytes of RAM, a 360K-byte floppy disk drive, a serial board and a 10M-byte hard disk.)

Both AT models are built around the Intel 6-MHz, 16-bit 80286 microprocessor and IBM's new 16-bit I/O bus, performing at a rate two to three times faster than the Personal Computer. While the added speed won't make you a more accomplished typist or quicken the pulse of your printer, it will hasten copying files, recalculating worksheets and sorting data base records. Common to the two versions of the AT are 64K bytes of read-only memory (ROM) (including an enhanced Basic interpreter), the capacity for up to 3M bytes of user memory, a real-time clock/calendar with battery backup, a socket for the 80287 math coprocessor, a combination floppy disk and hard disk controller board, eight expansion slots and a 192W power supply (including a fan whose speed varies with the temperatures, reducing noise).

The AT boasts a revamped 84-key keyboard with modifications that are apt to please critics of the Personal Computer's. The AT keyboard, however, cannot be used with the Personal Computer or any other product in IBM's Personal Computer family. One other accoutrement of note is Keylock, a security lock on the front of the system unit designed to control access in network settings. Locking the AT prevents rebooting, shuts down the keyboard and prohibits removal of the system unit cover. Keylock is also available for the Personal Computer, the XT and the XT/370.

IBM's confidence in its latest entry extends to service. The company is including a one-year warranty with the product.

The new IBM machine does not include a video board or a monitor. The Personal Computer's monochrome and color graphics boards work on the AT, but quite a bit of the existing Personal Computer hardware doesn't. Among the options for the AT are a half-height, 5¼-in. 320/360K-byte floppy disk drive, a second internal 20M-byte hard disk, a floor-standing enclosure and a tilt-and-swivel monitor stand (suitable for the entire Personal Computer line).

Although it is a slightly different kind of option, DOS 3.00 is the AT's new single-user, single-tasking operating system; it is priced at $65.

Media and the message

The AT is most modular in the area of disk storage. The machine is equipped with compartments for three disk drives — either two half-height floppy drives and a full-height, 20M-byte hard disk or a single half-height floppy drive and two full-height, 20M-byte hard disks. The second hard disk is tucked beneath the 1.2M-byte floppy drive in the AT's right-hand compartment. Incidentally, a 1.2M-byte floppy lists for only $225 more than the new half-height, 320/360K-byte drive.

In addition to mixed and matched disk drives, the AT offers a choice of floppy disk drive capacities. DOS 3.00, the AT's primary operating system, reads and writes in the traditional 320/360K floppy format, but IBM is selling the AT's 320/360K unit only as a second floppy drive. DOS 3.00 is tailored to the 1.2M-byte floppy drive — and that means certain limitations as well as added storage space.

If you require data interchange via standard 320/360K disks, you'll need to add the AT's 320/360K floppy drive. The 1.2M-byte floppy drive can read and write in the 320/360K formats, but what it writes can only be read by the 1.2M-byte read/

write head. That head is narrower — and thus more sensitive — than the read/write head in the Personal Computer's 320/360K drive.

Not surprisingly, the AT relies on new disk media capable of handling the higher density format. IBM's high-capacity disks were designed to be formatted with twice as many tracks in the same 5¼-in. space — 80 as opposed to the old 40. The high-capacity format uses 15 sectors per track, in contrast with the eight used for disks formatted under DOS 1.00 or 1.10 and nine for those under DOS 2.00 or 2.10. Data stored in the new format cannot be accessed under DOS 2.00 or 2.10 without the addition of drivers. A box of 10 high-density disks runs about $80, but the new format proves to be a better value per byte of storage than its predecessor.

Playing the slots

The AT was built to grow. The machine features eight full-length expansion slots, each with a standard 62-pin connector that accepts boards designed for the Personal Computer's 8-bit data bus. Six of the eight slots are accompanied by an additional 36-pin connector that makes it possible to transfer data in 16-bit segments and address more than 1M byte of memory.

The combination floppy and hard disk controller board fills one 16-bit slot on the Model 68, leaving seven slots free. The combination serial and parallel board takes up an additional 16-bit slot in the Model 99.

Power users can have a field day with the AT's potential for additional RAM. IBM has filled half the 36 RAM sockets on the Model 68's motherboard with "memory modules," each consisting of two 64K-by-1-bit RAM chips piggybacked one atop the other. (Nine regular 64K-by-1-bit RAM chips provide 64K bytes of RAM on a Personal Computer; nine of the piggybacked chips provide 128K bytes.) The AT motherboard accepts only these unique modules and only in increments of 18 — thus supplying the Model 68's 256K bytes of RAM. The Model 99 features 36 such piggyback modules, filling the motherboard RAM sockets. To beef up the Model 68's RAM to 512K, you can buy a 256K memory module expansion kit for $495. But before you can add the memory expansion board to the Model 68, you'll first need to fill the motherboard's RAM sockets.

Either AT model can accept one 128K-byte memory expansion option once the motherboard is filled with RAM. This brings the machine up to 640K — the maximum addressable RAM in the Personal Computer's architecture. (The Intel 8088 addresses 1,024K bytes of memory, but the last 384K is reserved for functions other than user RAM.) Part of the appeal of the 80286 is its ability to address up to 16M bytes of RAM. Accordingly, IBM enables you to increase the 512K-byte AT to 3M bytes, in five allotments of 512K.

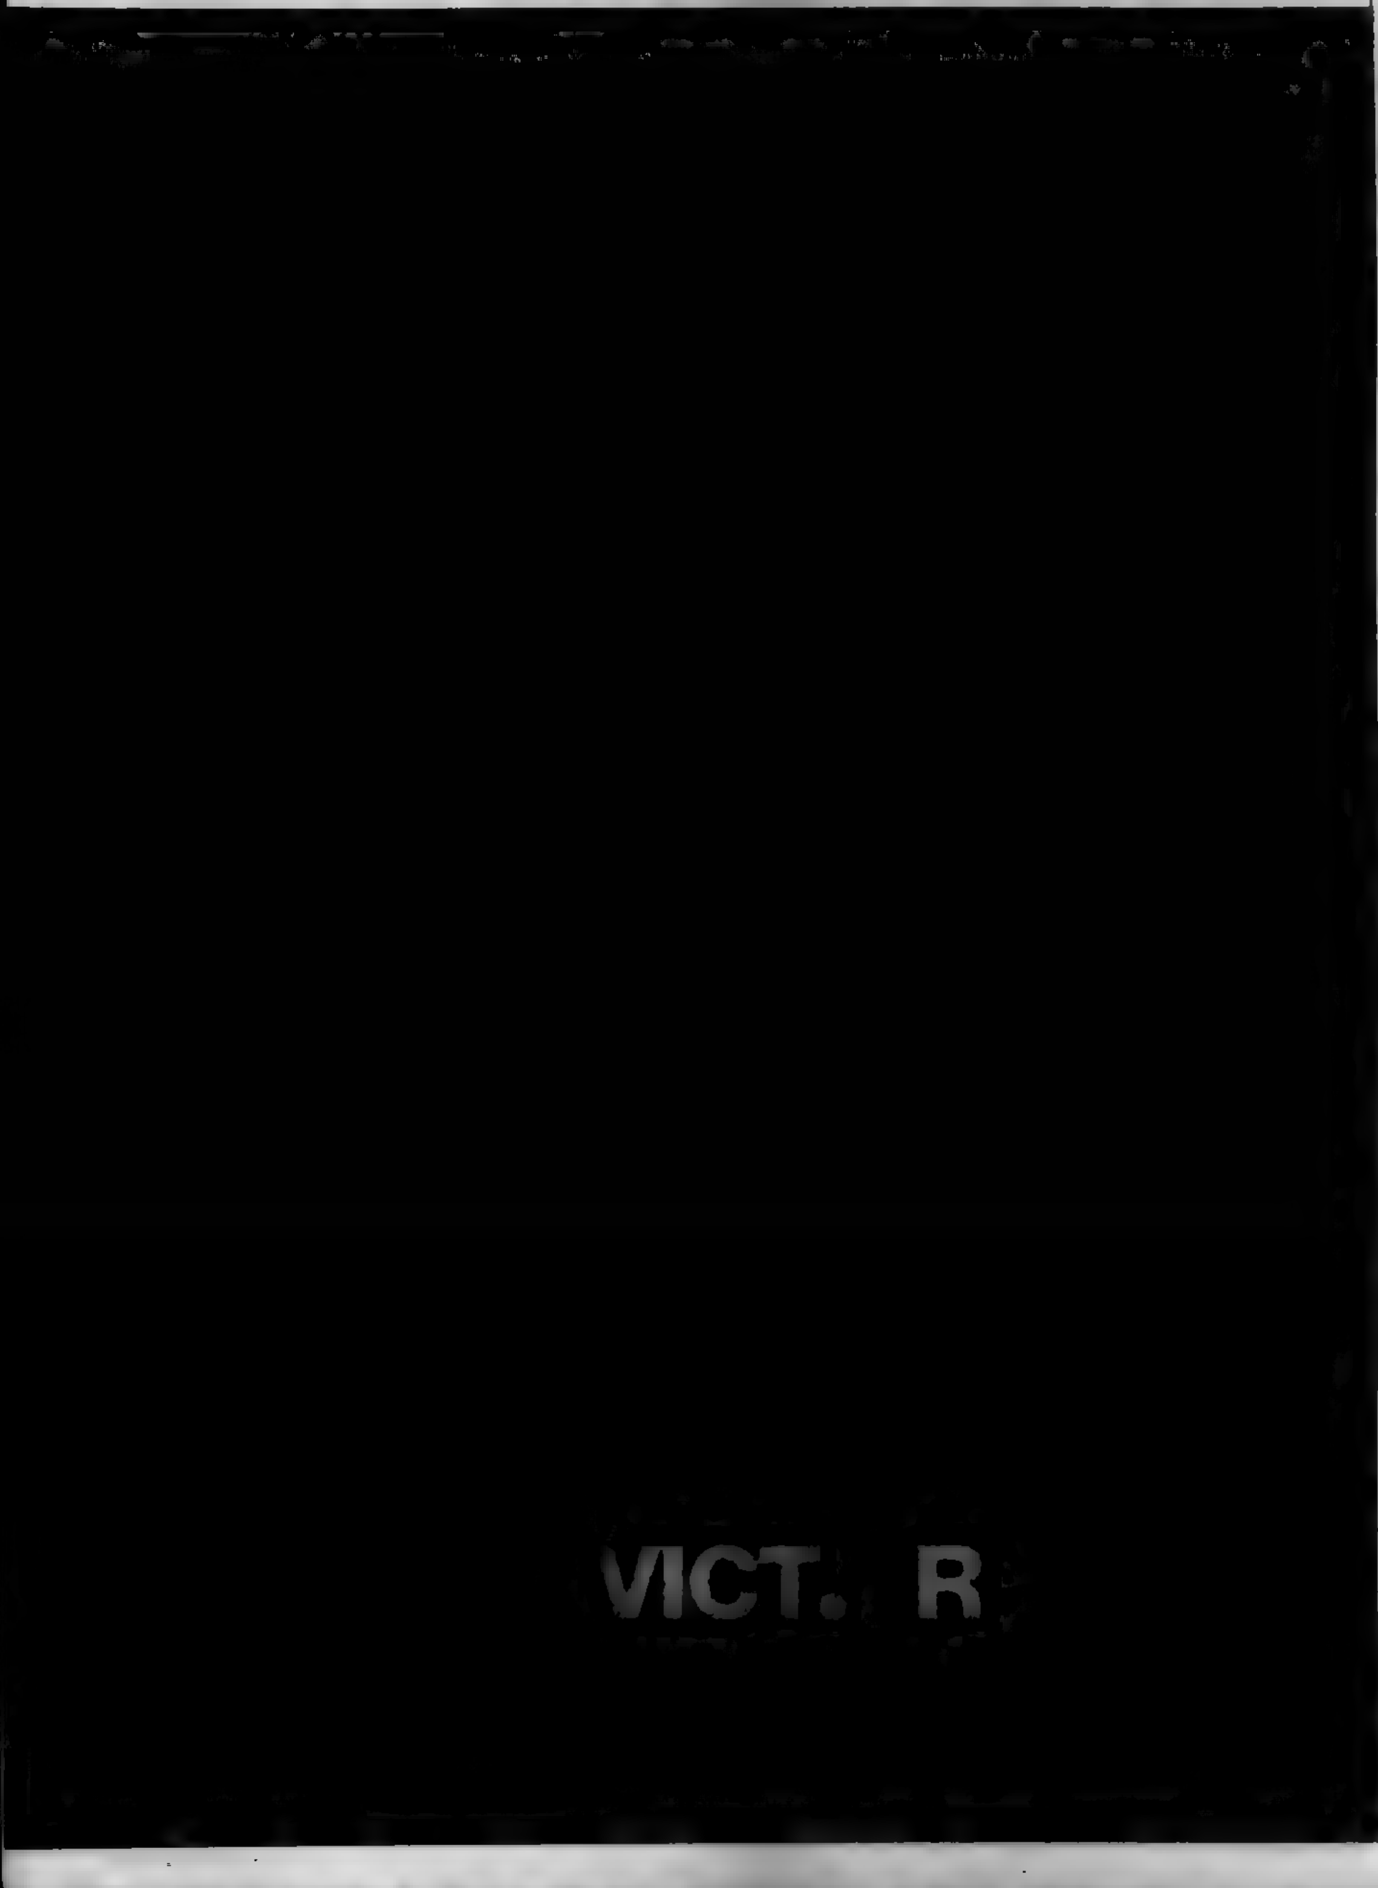
Power users can have a field day with the AT's potential for additional RAM.

Theoretically, products from third parties could boost RAM beyond 512K bytes per board, which would enable RAM in the AT to exceed 3M bytes. All this RAM is open to Xenix users, but aside from DOS 3.00's Vdisk (RAM disk) utility, DOS 3.00 function calls (upon which application programs rely) cannot recognize more than 1M byte of RAM.

None of Big Blue's memory expansion options includes the new (and still scarce) 256K-by-1-bit RAM chips. All the new memory expansion boards for the AT require a 16-bit slot.

Managing memory

What will you do with all that RAM? Tim Sammons, a consultant who heads Sammons & Associates in Berkeley, Calif., suggests that the AT's capacity initially will encourage users to rely on multiple RAM disks. "You'll be able to bring software and data into memory and then do your processing without repeated floppy disk reads. This increase in speed will be helpful in large data management applications."



Sammons says he is convinced that, over time, extra RAM will make software both easier to use and more intelligent. Help files and truly helpful error messages will be readily available and not confined to a disk. Expert systems and artificial intelligence in general, now suffering under the RAM limitations of current machines, may also get a shot in the arm from the AT's prodigious memory.

But perhaps the major assignment in store for the AT's extended RAM is multitasking — the capacity for one machine to execute several jobs simultaneously. In this role, the 80286 truly shines. When multitasking applications are assigned to an XT, for example, there are no hardware circuits to keep tasks separate, and, thus, applications can write over each other in memory. The 80286 partitions memory, essentially setting up fences between segments of RAM. In this case, good fences do make good neighbors. The XT's 8088 can perform multiple tasks, relying on such window managers as Topview and Desq, but RAM is defenseless against overwrites.

In addition to its multitasking prowess, the AT has the ability to function in a multiuser environment, enabling several users to share it simultaneously. The machine's supply of serial ports initially limits it to three users — two at workstations and one at the host.

In order for the 80286 to serve multiple users and perform multiple tasks safely, the AT requires an appropriate operating system. Enter PC Xenix, a version of Unix System III adapted for IBM by Microsoft Corp. The 80286 is capable of operating in two modes. Under multiuser/multitasking Xenix, the chip works in the protected (that is, memory-protected) mode. When the AT runs under DOS, the 80286 operates in the compatibility mode — so called because the 80286 works with software for the 8088/8086 family of processors. When you boot the AT, the operating system used determines whether the machine is in the compatibility or the protected mode. (PCIX, a version of Unix for the 8088, runs on the AT in the compatibility mode.)

AT as server

PC Xenix unquestionably makes good use of the 80286, but the AT's multitasking/multiuser operating system won't be available for a few more weeks. Applications written for Xenix may not be plentiful for quite a while, and with the AT initially supporting just three users simultaneously, IBM has only skittishly entered the Personal Computer-based multiuser market. Even if third parties load the AT with serial ports (which Xenix and the 80286 can handle easily), IBM has another communications role in mind for its latest machine. Networking is the name of Big Blue's new game.

At the time it introduced the AT, IBM unveiled its PC Network for resource and data sharing. The network places the AT at center stage as a file server capable of simultaneously acting as a workstation. But consistent with its emphasis on peer-to-peer communications, the PC Network accepts an XT or another hard disk compatible as server.

In this way, IBM's Personal Computer-based local-area network enables the company to maintain a "PC philosophy." IBM, after all, is interested in selling and linking Personal Computers, not Ascii workstations. While a true multiuser system shares processing power among users who typically rely on dumb terminals, the PC Network fosters file and hardware sharing among users equipped with processors of their own.

Consultant Sammons puts it this way: "Relying on shared logic systems diverges from IBM's basic strategy. IBM would rather have customers buy minicomputers, not personal computers, for shared logic." Will Zachmann, a market analyst with International Data Corp. of Framingham, Mass., concurs: "Multiuser systems represent a much more limited market [than stand-alone personal computers do]. Networking Personal Computers is a perfectly viable alternative — one that individual managers prefer."

Betting on broadband

Early this year, IBM announced that its proprietary network to link Personal Computers, minis and mainframes would not be released for roughly two years. This

IBM claims that the PC Network can easily be installed in a small business. It can link as many as 72 Personal Computers within a 1,000-foot radius.

ambitious network is based on a token-passing ring arrangement that relies on twisted-pair cabling. (In a token-passing ring configuration, computers are connected in a circle. A single "token" or signal, representing the right to transmit data on the network, is passed around to each computer. Twisted-pair wires provide an inexpensive connection among computers and transmit frequencies over a single channel.)

Aware that market interest might burn out while the company fiddled, IBM released its version of a broadband Personal Computer-based network developed by Sytek, Inc. of Mountain View, Calif. (A broadband local-area network links computers with a cable capable of rapidly carrying many signals at once.) IBM claims that the PC Network announced in August can easily be installed in a small business. Tim Sammons agrees, calling the network "ready-to-wear."

The PC Network consists of the kind of coaxial cable used for cable television, a $695 network board for each Personal Computer and a $595 translator unit for each network. The translator, which converts the incoming signal to a frequency that all network adapters can receive, is connected by cable to as many as eight Personal Computers in a 200-foot radius. Connecting more than eight systems or extending the radius requires a Base Expander, which is essentially a repeater that boosts the signal.

The PC Network can link as many as 72 Personal Computers within a 1,000-foot radius. This is achieved through the use of Base Expanders and Short-, Medium- or Long-Distance Kits (which include cables and connect up to eight Personal Computers). IBM claims that with the addition of third-party hardware and installation help, the network supports a

Herbie Briggs has just destroyed the myth that all floppy discs are created equal.

They seem equal. Until you look at the seams.

That's where equality ends.

Most companies seal their discs with a spot here, a spot there. Leaving most of each seam not sealed at all.

Sooner or later, the seams might do what comes naturally: they bulge. Warp. Pucker. Open up.

Pens, pencils, fingernails—even a four-year-old's, like Herbie—can catch and snag in those wide open spaces.

That's sloppy. And dangerous. Because if you put a sloppy floppy into your disc drive, it can jam your drive. Ruin your drive head. Lose your data.

So much for their seams. Ours are different.

THE SLOPPY FLOPPY: Sealed with a spot here, a spot there. Leaving unsealed seams everywhere.

Memorex uses a process we developed, called Solid-Seam Bonding.

Solid-Seam Bonding seals shut every inch of every seam of every Memorex® floppy disc. Tight as a drum. That makes the Memorex floppy stiffer. Stronger. And your data safer.

To resist bulging, warping, puckering, or opening up.

MEMOREX SOLID-SEAM BONDING: Every inch of every seam is sealed shut. Tight as a drum.

To resist all the things that can jam your drive, ruin your drive head, or lose your data.

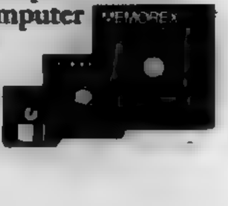
Which proves that a Memorex floppy disc isn't equal to all the others. It's better.

Solid-Seam Bonding is just one example of the extra care that goes into every Memorex floppy disc. Be it 8," 5¼" or the new 3½." Extra care that lets us guarantee every Memorex disc to be 100% error-free.

The next time you're buying a floppy disc—or a few hundred of them—just remember this:

It's always better to be safe than sloppy.

For more information on the full line of Memorex quality computer media products, including computer tape, call toll-free: 800-222-1150. In Alaska and Hawaii call collect: 408-987-2961.



Your Data. When it matters, make it Memorex.™

maximum of 1,000 nodes within a three-mile radius.

Data is transmitted throughout the network at a rate of 2M bit/sec via the CSMA/CD (carrier sense multiple access with collision detection) protocol. (CSMA/CD is a common, proven networking technique in which a Personal Computer sends a packet of data only when the network is quiet. If two computers send a packet at the same time, each will recognize that the packets have been scrambled, then will alternately check network traffic before resending.)

From computer to computer, the data transfer rate is 200K bit/sec. By using coaxial cable to transmit a broad band of frequencies, the PC Network can send voice and video as well as data.

The heart of the network is the board, made by Sytek to IBM's specifications. The board fits into an 8-bit slot in any member of the Personal Computer family, except the PCjr and the PC Expansion Unit.

PC Xenix doesn't support the PC Network, but DOS 3.10 does.

The adapter includes a pair of Intel coprocessors, the 80188 and the 82586, which operate at the same 6-MHz rate as the 80286.

The 80188, which incorporates the 8088 and support chips into a single unit, works with a 32K ROM module on the board to manage the network (including power-up, protocol processing, error detection and transmission). The 80188 also governs the 82586, which controls communications with the network via an RF modem on the board.

An 8K-byte ROM module, the Netbios, serves as the basic I/O system between the network and the host Personal Computer. The software on the network board generates a "session-level interface" (that is, menus). The board also includes 16K bytes of RAM, set aside as a buffer. IBM released the board in August in the hope that software developers would write applications directly for the Netbios.

Another DOS on the way

PC Xenix doesn't support the PC Network, but DOS 3.10 does. DOS 3.10 will replace DOS 3.00 but not DOS 2.10. DOS 3.10, which IBM says will be available as a "trade-up" option for $30, is 3.00 plus support for PC Network hardware and software.

DOS 3.10 will work with all members of the IBM Personal Computer family (except the PCjr) and will occupy the same amount of memory as DOS 3.00.

DOS 3.00 has file-sharing capabilities (via the SHARE command) but lacks 3.10's network "redirector" facility. According to Dave Crane, a Dallas-based consultant, the redirector intercepts application program calls (such as those for disk or printer services) and redirects them into the network as required. The redirector also fields responses from the network and passes them to the application program.

The PC Network requires local-area network software in addition to that etched in ROM. The PC Network Program, priced at $75 and scheduled for release around the same time as DOS 3.10,

DOS 3.10 will work with all of the Personal Computer family (except the PCjr) and will occupy the same amount of memory as DOS 3.00.

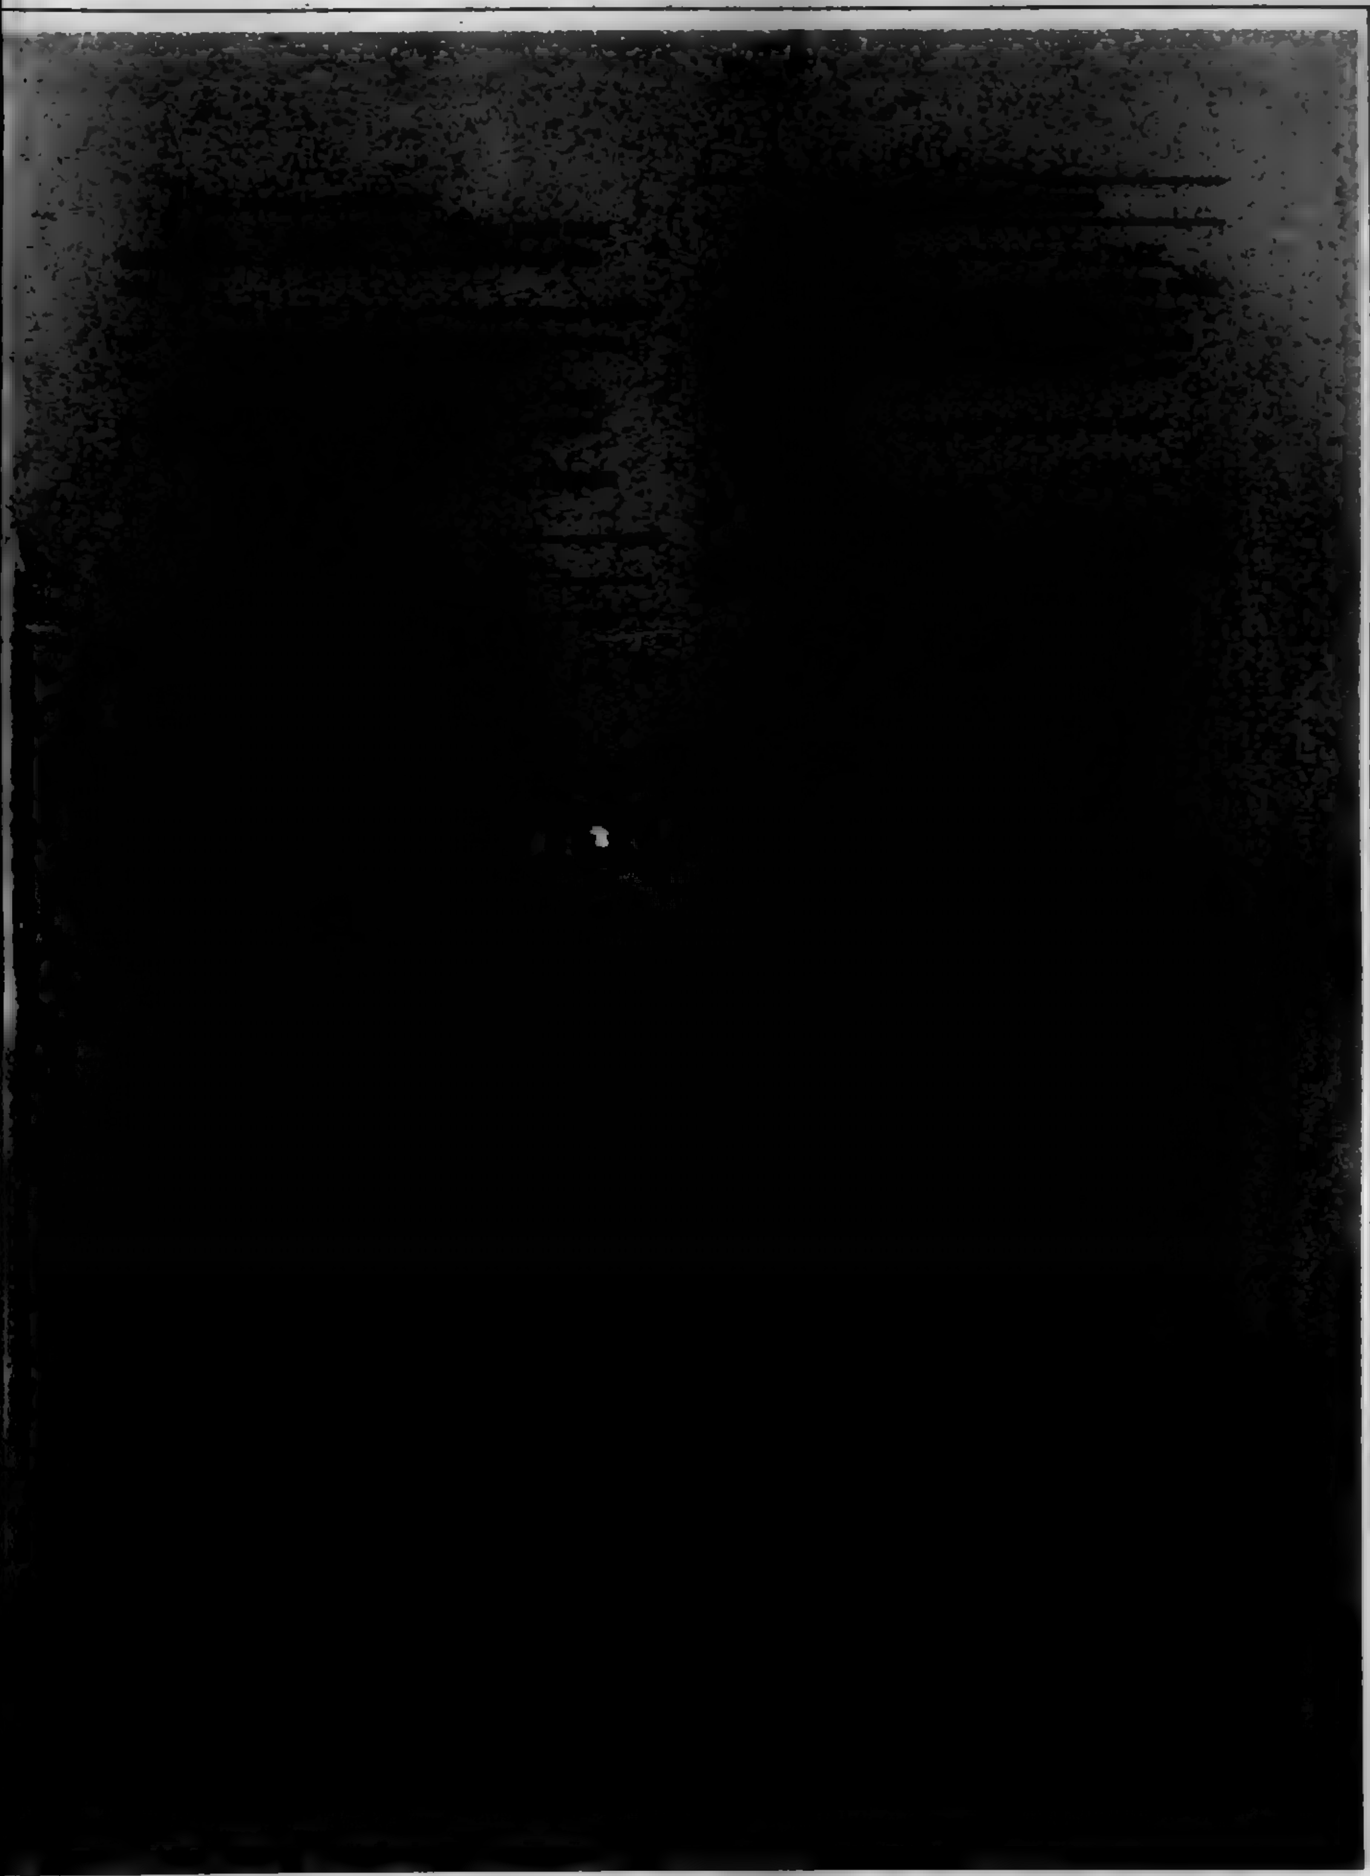
will provide server capabilities for file, print and message functions.

Crane notes that the PC Network Program will use DOS 3.10 to share resources and information among Personal Computers. The majority of applications running under DOS are expected to work with the new server functions.

"The software obviously controls the local-area network hardware, but unlike a lot of networks out there, it supports multiple file servers and peer-to-peer communications," Crane says. "Concurrent access to data by multiple users is also supported through sharing functions that still manage to maintain data integrity."

The PC Network is hardly IBM's last word on local-area nets. In addition to this peer-to-peer offering, IBM has endorsed the token-ring network, an industrial broadband coaxial network and the PC Cluster announced last spring.

IBM is especially committed to building a bridge between the local broadband PC Network and the potentially more pervasive token-ring plan.



Mindful of these seeming disparities, Big Blue has issued a "statement of direction" affirming its intention to connect all its networks. IBM is especially committed to building a bridge between the local broadband PC Network and the potentially more pervasive token-ring plan.

"Personal Computers will be able to be attached to both networks," says Bill Osborne, a senior planner for IBM.

"There are multiple ways of doing so, and we could do it now — it's not a technological problem," he adds.

(Of all of IBM's networking strategies, the PC Cluster remains the most rudimentary. The PC Network permits file sharing using hard disks as servers, but the PC Cluster doesn't.)

Tim Sammons, who relied on Sytek's local-area network in wiring the Democratic National Convention last summer, points out that the IBM/Sytek network fills a [redacted]

Gaining mastery of the AT may entail a lengthy learning process.

"It enables incompatible equipment — printers, character readers and so on — to communicate," Sammons says. "But Sytek is not the answer for everyone — it's primarily for those who have an eclectic mix of equipment already. Sytek doesn't provide top-flight integration, just a good level of performance."

With the AT batting cleanup, IBM is a formidable player in the network ballgame. But the new computer is surely among Big Blue's most complex small machines, and gaining mastery of its stand-alone and communications characteristics may entail a lengthy learning process.

"For some organizations, this could even be a first computer," says IBM's David Camm. "The network will provide interesting capabilities, but I don't want to categorize the AT's market size or the machine's niche. Let's just say that the facility for expansion is there."

Announcing

The one-stop, international advertising service for micro marketers.

You'll reach microcomputer buyers all over the world with *Computerworld's* International Marketing Service (CWIMS). Because we have the microcomputer market *covered* with an international network of publications. And what a market!

As the need for computerization in government, industry and educational systems all over the world becomes more acute, countries look to the cost-effective, adaptable microcomputer to bring them into the computer age. This means a very lucrative market for the U.S. micro marketer, since international product demand exceeds product supply.

Now, with the help of *Computerworld's* International Marketing Services, you can advertise in twenty magazines devoted exclusively to supplying information to microcomputer users in: Australia (*MicroWorld, Australian PC World*), Brazil (*MicroMundo*), Canada (*PC World Canada*), Denmark (*Micro Verden*), Finland (*Mikro*), France (*Golden, OPC*), Japan (*PersoCom World*), Mexico (*Compu Mundo*), Norway (*Mikro Data, PC Mikrodata*), Sweden (*MicroDatorn, Min Hemdator*), Spain (*Micro Sistemas*), Sweden (*Svenska PC World*), The Netherlands (*Micro/Info*), West Germany (*MicroComputerwelt, PC Welt, Run*). And your advertising message can reach buyers of microcomputer products and services around the world through special micro sections in any of over 40 publications in 25 countries.

Act now—and take advantage of this international demand for microcomputer products. Whether you want to test the market—or locate a distributor or representative—our publications will put you in touch with the right people around the microcomputer world.

For more information on getting international micro coverage, call Diana La Muraglia, General Manager, International Marketing Services, toll-free, at 800-343-6474. In Massachusetts, call 617-879-0700 or return the coupon below.

THE SURVEY

The study took place this summer among individuals on a list of top computer executives compiled by ACR Corp. of Phoenix. ACR randomly drew 1,000 names from its total list of 8,950. Each was sent a questionnaire on June 6, and 439 usable responses were received. The CW Communications Research Department tabulated the results.

Nearly half of all respondents were directors, managers or supervisors of MIS or DP services, and another 14% classified themselves as directors or managers of operations, planning or administrative services. Twenty-three percent were corporate officers.

Respondents' organizations represented all industry categories, with the largest percentages from manufacturing (22.4%) and finance, insurance or real estate (13.2%). Median company size, measured by sales revenues, was in the $50 million to $249 million range, with nearly 4% of companies claiming sales revenues in excess of $10 billion.

Respondents as a group were overwhelmingly male (94.8%), with a median age of 42 to 45. They earned a median salary of $50,000 to $60,000; more than 30% took home $60,000 or more.

> **Thirty-four percent of respondents said that a staff member had been added to handle purchase and use of micros.**

of the organizations (Item 7).

Among the two-thirds of respondents who said that one department is primarily responsible for personal computers in the organization (Item 3), 81.7% said that the department to do this is MIS or DP (Item 3a). Forty-one percent of these same respondents said that the specific person responsible for personal computers was the director of DP (Item 3b).

Thirty-four percent of respondents said that a person had been added to their organization's staff to handle the purchase and use of personal computers (Item 4), and 66% reported that this person, whatever his title, was to be found in the MIS or DP department.

In a separate question, respondents were asked in what ways the MIS or DP department gets involved in the purchase and utilization of personal computers. That involvement is extensive (Item 6). In more than three-fourths of the cases, the MIS or DP department takes part in:

- Advising the user department on purchase.
- Coaching users in setup and operation.
- Coaching users with specific problems.

In addition, half of the respondents said their MIS or DP department is responsible for training users. In almost half the cases, they are involved in:

- Planning use and applications.
- Establishing an approved vendor list.
- Buying personal computers for other departments.

Nearly three-fourths of respondents said their MIS or DP department "plays the major role" in personal computer software recommendations and purchasing. The next department is the user department, but that is cited by less than 20% of respondents, and top corporate management comes in a weak third with 7.2% (Item 8).

Operating systems

With regard to operating systems standards, respondents were asked which operating systems they thought personal computers should support, and the winner was Microsoft Corp.'s MS-DOS, with nearly three-fourths of the vote. Unix was next, with 51.3%, and all others were selected by less than half of the respondents (Item 9).

It is perhaps an indication of the difficulty of training people to use personal computers that so many methods seem to be employed by these companies. All four of the training methods we asked about received a substantial number of votes (use of training packages, training by MIS or DP staff, in-house classroom training and outside seminars).

In sum, we see a pattern of heavy use of personal computers across a broad spectrum of industries and organizations. We find the MIS and DP departments heavily involved in implementing this technology in their organizations.

In addition, the study shows extensive plans for increasing numbers of personal computers as well as more integration of these devices into corporate networks with mainframe access.

Jack Edmonston is group vice-president of communication services at CW Communications, publisher of Computerworld, *in Framingham, Mass.*

EXPERIENCE THE WORLDS OF UNIX*

UniForum '85 is your passport to the fascinating "Worlds of UNIX." You'll examine the growing impact of UNIX in Office Systems, Personal Computers, Engineering/Programming, and Market Trends at UniForum '85, the largest UNIX event ever held.

More than 200 major vendors, in 850 booths, will display and demonstrate all that's new in UNIX products and applications.

An extensive conference and tutorial program will expand your UNIX database. This program, organized by /usr/group, will include 14 all-day tutorials on user-specific aspects of UNIX...40 in-depth and informative conference sessions...four nationally-known plenary speakers.

In addition, a number of introductory courses in UNIX will be presented throughout the event.

UniForum '85 will be your total UNIX experience. Whether you're just getting started... or are a seasoned UNIX veteran...UniForum '85 is *the* UNIX event of the year.

THE USER EXPERIENCE

INFORMATION SERVICES

General Electric Information Services Company, U.S.A.

EXECUTIVE SUITE

This senior vice-president's story holds out hope for executives over 40 coming late to the microcomputer age.

Page 72

INFORMATION FOR ALL

Manufacturers Hanover's goal is to put information resources within the reach of 75% of professionals in three to five years.

Page 73

Raychem

MICRO NETS

Raychem, a Fortune 500 manufacturer, finds networking micros a cost-effective way to keep tabs on a business unit.

Page 78

EXECUTIVE SUITE

(Raymond W. Marshall is senior vice-president, Technology Operations, at General Electric Information Services Co. in Rockville, Md. His firm applies micros to operational analysis, decision support and business management.)

There is no doubt that micros have changed the fabric of doing business for many executives. A management consulting firm recently estimated that 17% of the nation's managers and 13% of the top executives now have access to microcomputers.

This rapid growth in the use of micros reflects the trend toward the integrated office where mainframes, minicomputers and micros will share the same information more efficiently. It will result in more productive people integrating electronically, allowing independent analysis of more data than ever before possible.

The micro has become a "window on the information world" for the busy executive. Rather than being a dumb-terminal user out at the end of a network connected to a host, the manager is now the center of his information universe.

Although many executives over 40 missed the evolution of computers and genuinely fear using one in their work, it is virtually mandatory for them to learn and become proficient in using a micro or they will be left behind.

Whether he likes it or not, the modern-day executive is being forced to more integral use of his micro — doing things differently than in the past, not just automating current operations.

At General Electric Information Services Co., more than 1,500 micros are in use by executives, managers and individual contributors. Because the company operates the world's largest voice and data telecommunications network, the use of micros by our managers and executives is probably slightly different from the experiences of other companies.

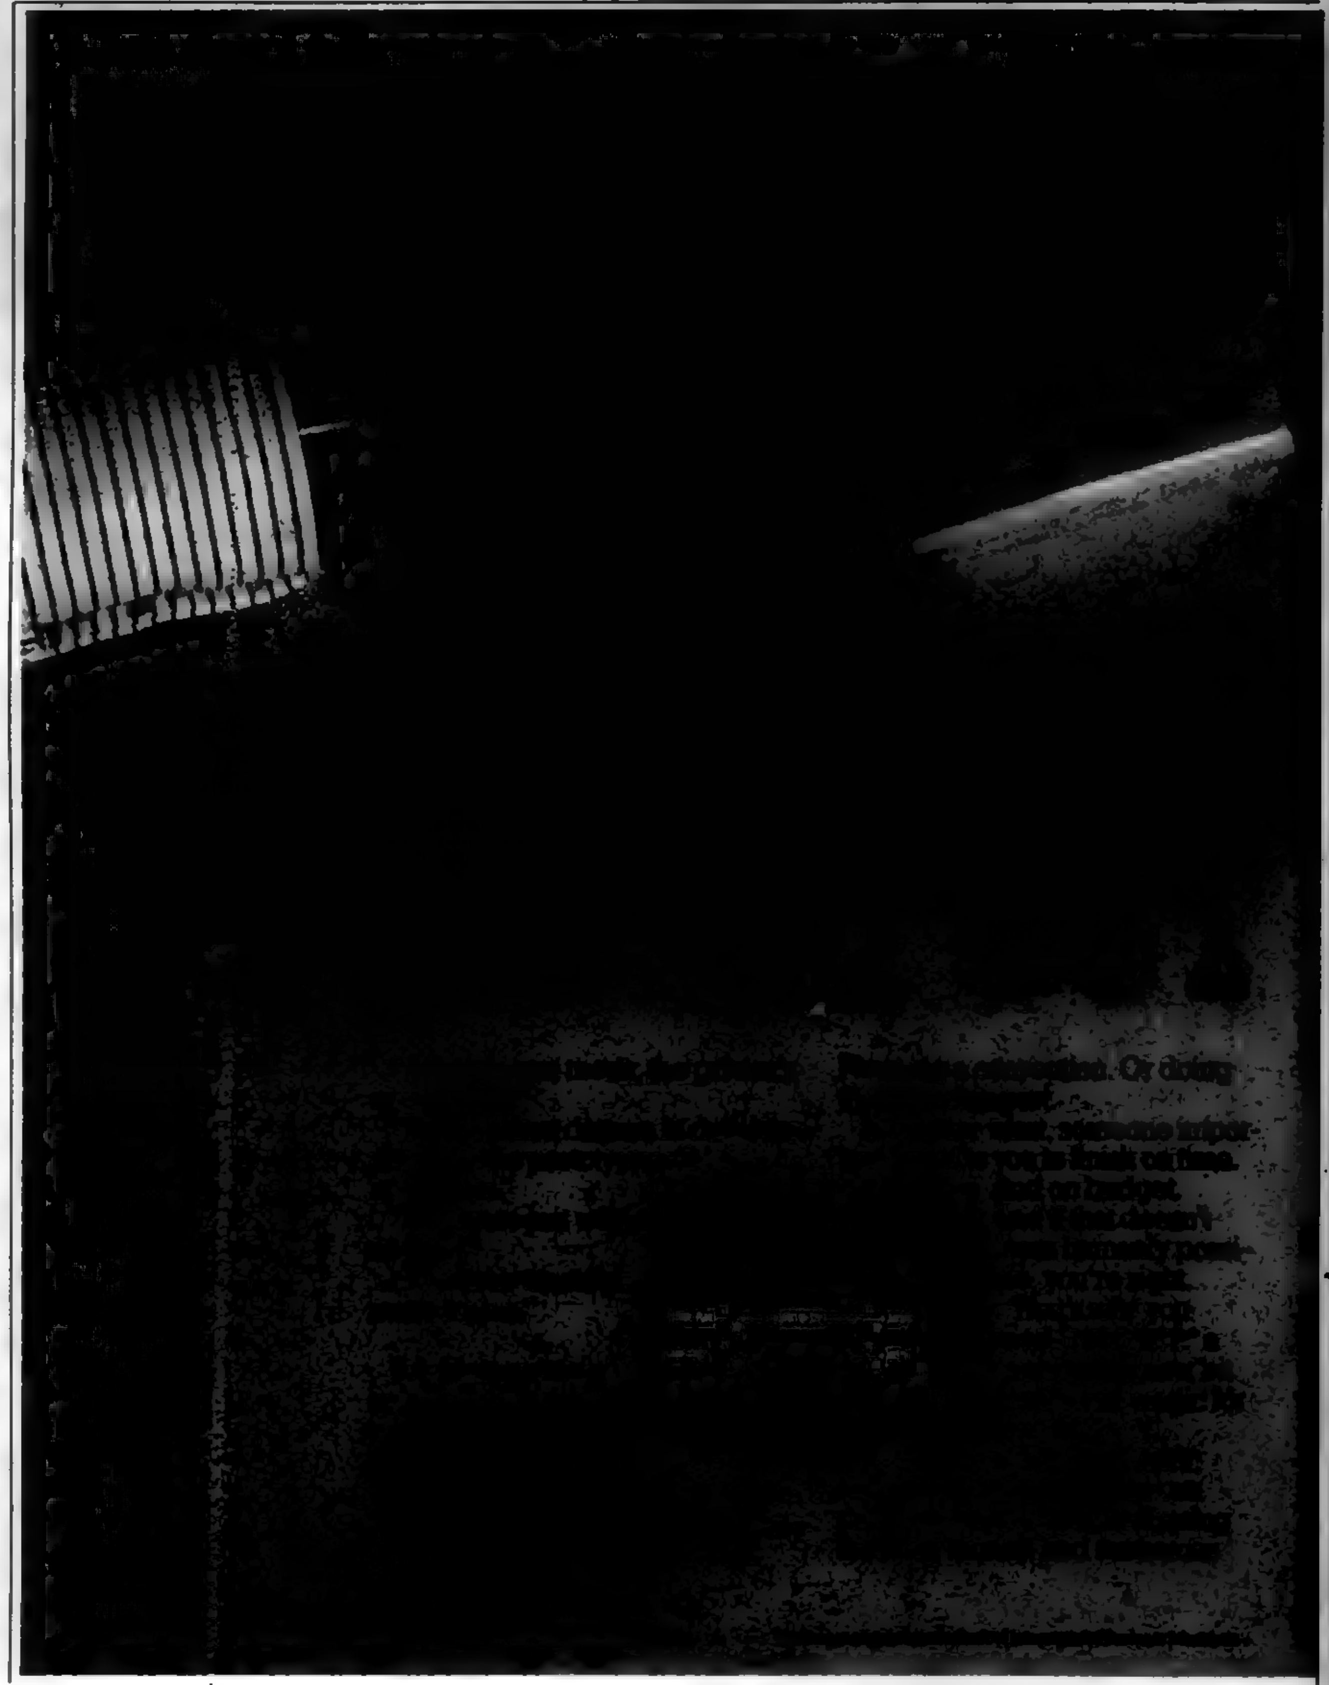
Basically, our micros are used in three main areas: operational analysis, decision support and business management.

In terms of operational analysis, micros allow us to keep constant tabs as we plan and manage our communications networks. Data can be collected and verified, either on-line or offline, by using a micro and then transmitted to our network for further processing, if needed.

For example, our micros are used in telecommunications planning and operations analysis of Dial Comm — General Electric Co.'s long-distance telecommunications network, which is the largest private industrial telephone system in the U.S. Micros enable us to track new orders for Dial Comm service throughout the company, review service contracts and monitor the system's quality control. Similarly, micros are used in the data network to provide both planning and real-time network monitoring.

In the decision support area, I use my micro in reviewing various company worksheets and spreadsheets, for financial analysis and to ask what-if questions that no one had the time to answer before.

Raymond Marshall uses a micro to review company worksheets and spreadsheets.



I use the micro at least three different ways in the area of business management. First, I use it extensively as a communications device in the office and when traveling on company business.

Through our electronic mailbox system, Quik-Comm, which is accessed by my micro, I am able to keep in communication with my office in Rockville, Md., and with many other GE components throughout the world while traveling. When I return home from a trip, or in the evening and on weekends, I use the micro to pick up and send messages to my secretary and my colleagues.

I can also use the micro to access centralized data bases that may be of value to me in doing my job more efficiently.

A third business management use is in critical project analysis through our Mark III teleprocessing network. I am able to review project schedules, do inquiry/status checks and to review quality assurance reports and other engineering reports.

In addition, I see micros used extensively in financial analysis of the company's operations and business opportunities.

Market forecasts

According to the Yankee Group, this year the number of micros in use in the office will double to 6.4 million units. A market research group also contends that by 1987, nearly 80% of the U.S. labor force will interact with the computer on the job.

Two major factors will cause the use of micros in the corporate world to expand: One is the increased exposure of corporate executives and middle managers to new hardware and software as a result of massive advertising campaigns and increased news coverage. The other is the incorporation of micros into the nation's educational system — from elementary school through college.

Frequently the business manager views micros only as stand-alone devices. In essence, he has a short-range view of their potential. The business manager who uses micros strictly for word processing, electronic spreadsheets and charts and graphs is only beginning to use the micro to its full capability. The intersection of the microcomputer, a large-scale communications network and a large mainframe will provide a magnum increase in the value of micro use in the second half of this decade. This arrangement will allow for the balancing and pulling together of all available data within a company.

INFORMATION FOR ALL

(Donald E. Smith is president of Manufacturers Hanover Financial Management Systems, Inc. in New York. He says that while technically oriented managers and professionals were the first to show interest in personal computers at his company, the balance is now beginning to shift to business managers.)

Manufacturers Hanover Trust recognized in 1981 that personal computers were significantly different from the front-office technologies it had been using. It was relatively easy to predict the impact of the earlier tools on the organization and to avoid disruption. Personal computers, with their richness of applications and potential for connectivity, are more complex and, therefore, more capable of disruption.

Corporate officials acknowledged, however, that personal computers could solve many of the integration problems with which the business had been struggling. In one cost-effective package, they can perform many functions that are typically performed in less integrated fashion. Most important, personal computers also can give users direct control to customize solutions to their particular business problems.

Manufacturers Hanover's General Administrative Board issued a "Personal Computer Acquisition Policy" in June 1982. The policy requires that all requests for personal computers be approved by user senior management and be acknowledged by the office automation group. In response, office automation has formed a separate personal computer unit to focus on the task.

In-house computer stores play several roles. They are learning centers in which demonstrations and tutorials are conducted to teach the basics of the most commonly used software. Manuals are available and prospective users are encouraged to learn more about a package of interest by actually running it themselves. In short, the stores ensure that MHT does not wind up with an expensive inventory of unused, unsupported, misunderstood systems hidden in closets.

The first group to call for personal computers was data processing professionals. Since Manufacturers Hanover made extensive use of IBM mainframes in its data center, IBM

You live so

A 3M diskette can make one read/write pass on every track, every hour, every day for 200 years and still be in terrific shape.

Has 3M discovered the floppy fountain of youth?

In a way, yes.

We discovered that if you want to make a floppy that's certified 100% error-free and guaranteed for life, you have to make every last bit of it yourself.

That's why we're the only company that controls every aspect of the manufacturing process.

We make our own magnetic oxides. And the binders that attach them to the dimensionally stable substrate. Which we make ourselves from liquid polyester. Which we make ourselves.

We also test our

should long.

floppies. At least 327 ways. And not just on exotic lab equipment with perfectly aligned, spotless heads. But also on office equipment like yours. We even reject a diskette if its label is crooked.

Some companies claim their floppies are as good as ours.

They should live so long.

One less thing to worry about.

By concentrating on IBM and Wang, the office automation department feels it is capable of providing the support needed by its users.

was a logical choice for this user set.

The traditional office automation customer was next to seek personal computing. In this arena, the front office, user friendliness is a key consideration, and a large base of Wang VS and OIS systems had already been installed. Compatibility in these environments was ensured by the choice of the Wang Professional Computer.

Manufacturers Hanover does not expect to be a one-vendor shop, but the office automation department believes it is important to limit the number of vendors. By concentrating on IBM and Wang, the department feels it is capable of providing the support needed by its users.

While the company feels this approach is desirable now, as experience increases and costs become more predictable, the policy will undoubtedly change.

That is the perspective from the company's internal point of view. But now consider the automation plan for an entire generic business, and you will see that an important element in that plan is the central or host processing computer and its offspring, the data base of corporate records.

In a very simplified way, every act performed within the business relates to those records in one way or another. These acts can be broken into three large classes.

First is the activity designed to ensure the accuracy and currency of the data base. Data capture and work flow are the primary focus here, and interconnection to the host computer generally is the overriding factor in product selection, although there are unexploited independent niches of opportunity in any organization within this activity.

Today, Manufacturers Hanover has about 450 personal computers installed.

The second activity uses the data base without amplification or enlargement to inform or instruct others, both internal and external, as to status or required action.

Reporting is the primary focus here, and the facilities used are largely those of the central site for billing or status reporting, augmented by word processing and electronic mail — that is, basic office automation services. There are not many independent niches here; the heavy volumes and high visibility of these activities have traditionally received close attention from the DP organization.

The last activity analyzes the changing contents of the data base to understand the health of the organization and redirect efforts to enhance or maintain it. The people involved in this activity are the knowledge workers and decision makers. The great personal computer market that is perceived to exist in business has its foundations here. This group contains the curiosity seekers, data manipulators and problem solvers; the personal computer seems to be the inspired solution to their particular needs.

Dynamic and diverse in their use of data and analysis tools, the group is served with difficulty by the central host. They are the what-if players, and the large, highly organized machines are generally inappropriate for their purposes. Independent niches of opportunity abound in this area, but there generally will be corporate bias toward viewing these as the province of the office automation group.

Today, Manufacturers Hanover has about 450 personal computers installed — a two-year average growth rate of about nine systems per month. The rate is increasing, and by year-end, the total is expected to be more than 500. While technically oriented managers and professionals were the first to show interest in personal computers, the balance is now beginning to shift to business managers. The last personal computer users group meeting was attended by more than 150 people, most of whom were business and not data processing professionals.

Manufacturers Hanover's strategic objective is to provide information resources within arm's reach of 75% of managers and professionals within three to five years.

NOW THAT YOU'VE GOT THEM, WHAT ARE YOU GOING TO DO WITH THEM??

If you have personal computers in the office, two Special Reports from International Data Corporation's Office Automation Reporting Service (OARS) can help.

- PC Training Issues for Managers and Professionals: Options and Opportunities. The report profiles 29 training providers and lists more than 65. Market data and projections. $195.
- PC Networks in Large Organizations: What are the "Excellent" Companies Doing? Some of America's best-run companies talk about their PC communications plans. $295.

YES!! Sounds like OARS has what I need!

☐ Send me information about the reports described above.
☐ I'm ordering PC Training Issues at $195.
☐ I'm ordering PC Nets in Large Organizations at $295.
☐ My check for $__________ is enclosed.

Reports will be sent upon receipt of payment.

OR call Mary Trayte TOLL FREE at (800) 343-4952 to order today!

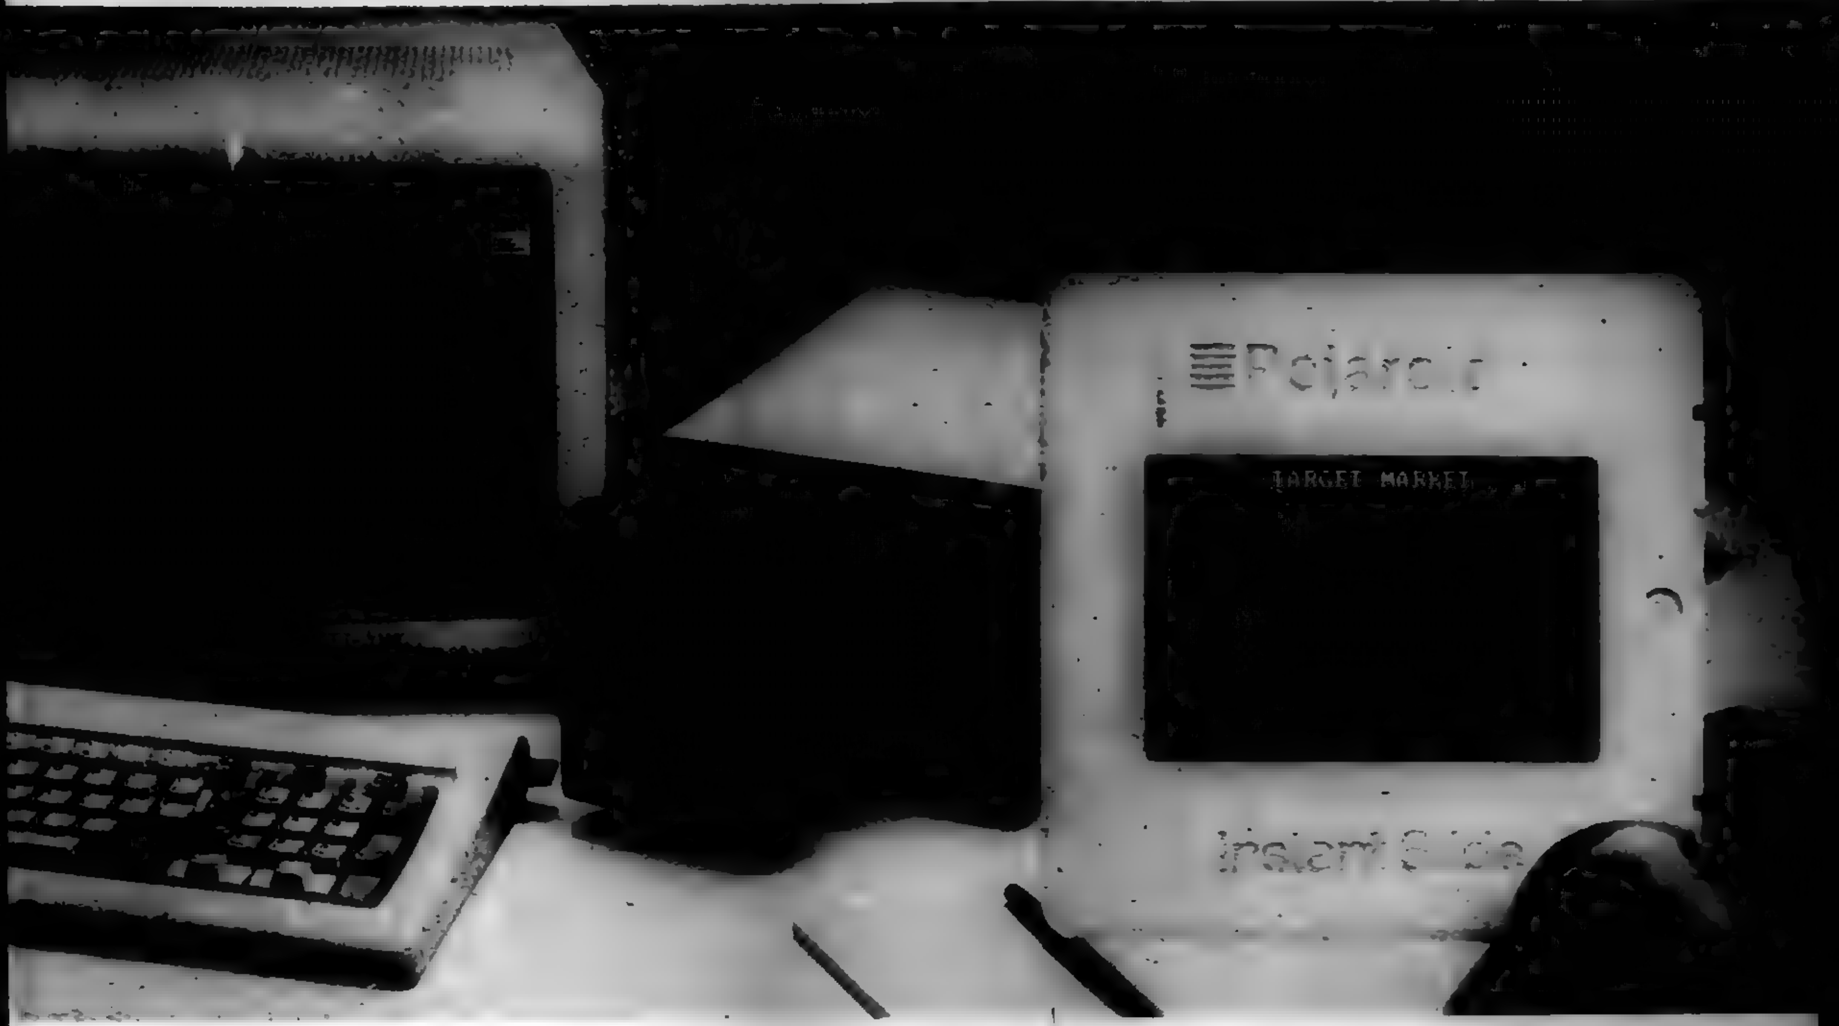
Now last minute presentations can be made from your personal computer. In color. In house. In minutes.



Introducing Polaroid Palette.

Whether your presentation is in 30 minutes or 30 days, the new Polaroid Palette Computer Image Recorder will make it easier. Priced at under $1800*, it lets you make Polaroid instant 35mm slides or prints from personal computer-generated data. Right at your desk. So now you can create a presentation in minutes. Without sending out for processing, paying premiums for rush service or risking the security of your confidential information.

Works with the graphics packages of the IBM PC or XT, DEC Rainbow, Apple IIe and II+ as well as other pcs.

The Polaroid Palette is designed to work with many graphics software packages. In fact, when using such popular programs as Graphwriter, Chart-Master, Sign-Master, DR Draw and DR Graph, Palette can virtually double both the horizontal and vertical resolution of your monitor. Plus, a "backfill" feature reduces raster lines for a smoother, more finished appearance. The result—presentation quality slides. On-the-spot.

Color 35mm slides, even from a black and white CRT.

Think of it as an artist's palette. Because Palette "paints" your graphs, charts and text. You're choosing from up to 72 colors. If you don't want red, press a few keys—it's green. And if you're not the artistic-type, Polaroid has developed a menu of color sets: combinations of colors that have been specially coordinated to complement your presentations. And all of this is yours, even if you have a black and white monitor.

Lets you make last minute changes or add up-to-the-minute information.

The Polaroid Palette is the fast, convenient, low-cost way to prepare slides for your presentation. And perhaps even more important, Palette allows you to keep confidential information confidential. You won't have to send your work out to anyone again.

So why wait until the last minute to find out about Polaroid Palette? Call this toll-free number or return this coupon. Because with Palette you'll make your deadlines, in no time.

Visit us in Booth 166 at Comdex.

For a demonstration, call toll-free, or mail the coupon to Polaroid Corp., E.I. Marketing, Dept. 603
575 Technology Sq., Cambridge, MA 02139.

MICRO NETS

(Marcia Brooks is associate editor of the "Office Automation Reporting Service," a monthly newsletter published by International Data Corp., an industry market research firm in Framingham, Mass. Here, Brooks describes how users at Raychem Corp. and other firms are setting up personal computer networks.)

When Thomas Peters and Robert Waterman published *In Search of Excellence* in 1982, the book soared to the top of best-seller lists. Recession was fresh in people's minds, and a renewed interest in enterprise under a strongly pro-business administration built a business advice-hungry audience. The book promised insights into what management was doing right at what were, in the authors' opinion, some of America's best managed companies.

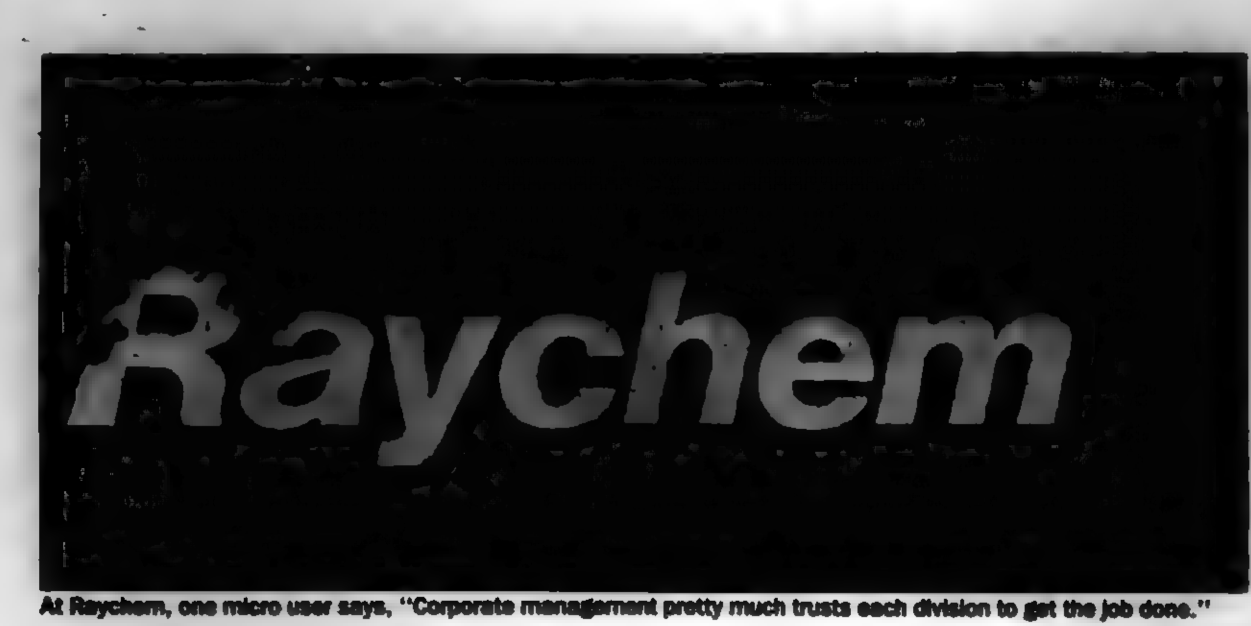
In a special report available this fall, International Data Corp.'s (IDC) "Office Automation Reporting Service" went in search of "excellent" companies to find out what, if anything, they were doing to communicate with personal computers. If they did so many other things right in administering their businesses, their personal computer strategies might provide some guidance to others lurching along the personal computer communications trail.

The "excellent" companies seldom proposed networking solutions that could be described as innovative or out of the ordinary.

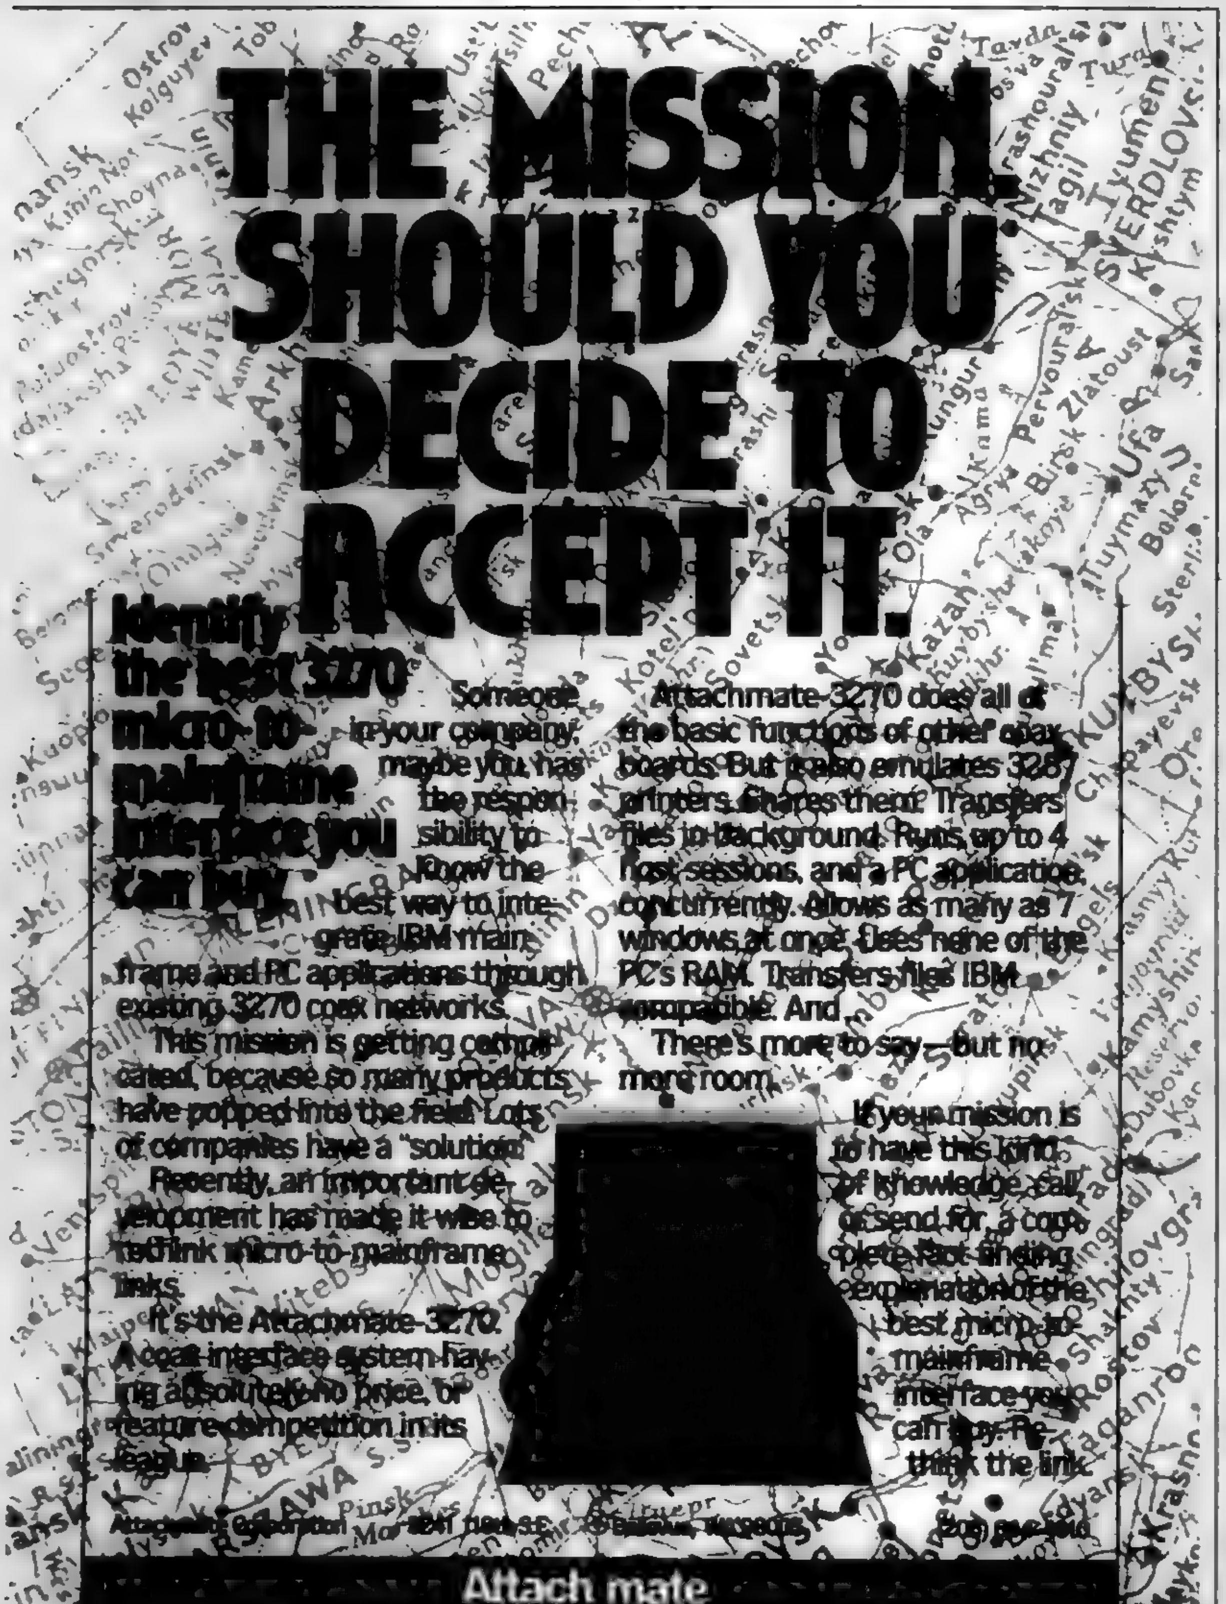
More than 30 large companies were contacted for the study, "Personal Computer Networks in Large Organizations," including several major office computer manufacturers. Employees at 18 companies (16 of them "excellent") were interviewed extensively about their personal computer communications plans.

Each company saw personal computers in terms of corporate strategy and culture. However microcomputers were deployed in a given company, they were to be used in a way consistent with the company's basic style of doing business. Personal computer networks, too, were designed with corporate culture in mind. If a company tended to be entrepreneurial, it developed flexible systems that responded to user demands, often with no particular concern for existing mainframe environments or entrenched office systems.

If, on the other hand, a company had strongly centralized management control, personal computer network access tended to be more formally structured and more strictly controlled.



At Raychem, one micro user says, "Corporate management pretty much trusts each division to get the job done."



THE MISSION. SHOULD YOU DECIDE TO ACCEPT IT.

Identify the best 3270 micro-to-mainframe interface you can buy.

Someone in your company, maybe you, has the responsibility to know the best way to integrate IBM mainframe and PC applications through existing 3270 coax networks.

This mission is getting complicated, because so many products have popped into the field. Lots of companies have a "solution."

Recently, an important development has made it wise to rethink micro-to-mainframe links.

It's the Attachmate-3270. A coax interface system having absolutely no price, or feature competition in its league.

Attachmate-3270 does all of the basic functions of other coax boards. But it also emulates 3287 printers. Shares them. Transfers files in background. Runs up to 4 host sessions, and a PC application, concurrently. Allows as many as 7 windows at once. Uses none of the PC's RAM. Transfers files IBM compatible. And . . .

There's more to say—but no more room.

If your mission is to have this kind of knowledge, call or send for a complete fact-finding explanation of the best micro-to-mainframe interface you can buy. Rethink the link.

Attachmate Corporation 3241 118th S.E. Bellevue, WA 98005 (206) [illegible]

Attach mate

Rethink the link

The so-called excellent companies seldom proposed or implemented networking solutions that could be described as innovative or out of the ordinary. In most cases, in fact, they were doing the most unimaginative thing of all: terminal emulation to a mainframe or minicomputer via hard wire. A few, however, arrived at unconventional solutions to data sharing.

But discussions with those companies pointed out that the single most important objective in personal computer communications is to gain access to host computer data. Even in the few companies that had implemented or begun pilots with peer-to-peer personal computer networks, the ultimate goal was to create a comprehensive, large system network of which personal computers were an integral part.

The special report findings on the excellent companies are bolstered by recent data from a survey conducted by IDC of large corporations' personal computer sites, also discussed in "Personal Computer Networks." Forty-one percent of large companies surveyed that have personal computers reported that more than half their personal computers had access to mainframes.

Peer-to-peer links appear to be a lower priority now, both for the companies interviewed and for respondents to the personal computer user survey. Seventy-six percent of personal computer user companies indicated that less than 5% of their installed personal computers were linked via small networks. Of the companies interviewed, only five had local personal computer nets in place. In many cases, however, companies were very interested in using peer-to-peer networks in the future. They hoped to make more efficient use of peripherals and storage or to improve intradepartmental communications.

One of the companies held up by Peters and Waterman as one that allows its units and employees a measure of autonomy is Raychem Corp., a Fortune 500 manufacturer of electronic components based in Menlo Park, Calif. Autonomy is exactly the thing Robert Hummer, formerly MIS manager at one of Raychem's divisions, said characterized the company: "We're an autonomous division. Corporate pretty much trusts each division to get the job done."

The personal computer network that evolved was not what Hummer had in mind when he went to a nearby computer store, Computers Plus in Sunnyvale, early this year. He started out just looking for a solution to his data storage problem and went in search of a hard disk. "But as soon as I looked at mass storage, it seemed obvious that it would be a good idea to network the machines," he said.

Why did it seem like such a good idea? "Well, the quality control department is downstairs at the back of the building. People upstairs do reports. With the network in place, they can have accurate data right there," Hummer explained.

Using microcomputers in a network is, Hummer thinks, a cost-effective way to keep tabs on a small company or business unit. "Mainframes give you complex reports, and managers won't read them. With micros, you can take data that previously wasn't even kept on mainframes and produce simple reports. It gives us a clearer picture of our situation, so we aren't wasting resources."

Of the companies interviewed, only five had local personal computer nets in place. However, many of the companies were interested in using peer-to-peer networks in the future.

Hummer started off with just three Apple Computer, Inc. Apple IIes in place, for which he chose Corvus Systems, Inc.'s Omninet with a 6M-byte hard disk. The net consists of a hard disk for file storage, a disk server that acts as an intelligent interface between the disk and workstations and an interface card in each personal computer. Data is carried over twisted-pair wires installed in certain walls within the building. The workstations are shared by users in several function areas. Hummer would have liked to wire the entire building, but he was in no hurry as long as AT&T and IBM apparently had set no clear course.

"The Corvus performed flawlessly with the Apples," he said. Satisfied with the network, he then decided to add two IBM Personal Computers, making a true multivendor network.

For the time being, Hummer will remain a loyal Corvus customer. He is enthusiastic about the network software Omninet provides, a critical factor, to his mind, in the operation of a personal computer network. But he is aware that Omninet has its limitations, too. "If you're going to use many more than about 10 files, you probably can't use a system like Corvus," he said.

The experiences of Raychem and others are detailed in "Personal Computer Networks in Large Organizations," which may be ordered from IDC Publications, 5 Speen St., Framingham, Mass. 01701.

Microcomputers contribute more when they have mainframe power.

Compatibility between mainframes and micros has continually challenged experts in information services. But now Boeing makes this dynamic combination of power and convenience and everyday fact of computing life. The result: unprecedented productivity.

We call this powerful breakthrough MAINSTREAM® Distributed Services. For example, our Business Management Workstation combines the new IBM® PC XT/370 with our EIS® (Executive Information Services) Decision Support Software. You can perform functions like modeling and report generation on the PC XT/370, which simulates a System 370 mainframe. And you can switch instantly to your multi-dimensional data base via MAINSTREAM teleprocessing.

For those not requiring the full functionality of the EIS software at the desktop, we also offer the EIS Micro Workstation, which lets you download, manipulate and upload data between your IBM PC or PC XT and the MAINSTREAM service.

Because both workstations have Value-Added Dealership (VAD) agreements with IBM, Boeing is your single source for hardware, software, host processing, education and training, and support.

Our Micro/8410 brings this powerful micro-mainframe combination to structural engineering. The Micro/8410 lets engineers formulate and reformulate on the MDX 11 microcomputer. And then quickly upload to IBM, CYBER or CRAY mainframes for detailed calculations using any of the most popular design packages.

These distributed services are all part of Boeing's approach to complete, integrated information services. Enhanced remote computing services. Distributed processing and micro/mainframe links. Office information systems. Software solutions. Education and training. And a variety of professional support services. For more information or the location of the sales office nearest you, call toll-free 1-800-447-4700. Or write BOEING COMPUTER SERVICES, M.S. CV-26-17B, 7980 Gallows Court, Vienna, Virginia 22180.

BOEING COMPUTER SERVICES A Division of The Boeing Company

Boeing is an authorized Value Added Dealer for the IBM Personal Computer, Personal Computer XT and Personal Computer XT/370.

Viva Italia

Now you can speak Italian to 35,000 DP professionals.

Computerworld/Italia, one of the latest additions to our international network of publications, brings the high quality of editorial that is associated with Computerworld to the Italian DP market. Its circulation consists of 35,000 DP professionals in computer user environments throughout Italy including the leading decision-makers in the various industries. Computerworld/Italia is published weekly.

The Italian computer market is expected to reach sales of over $1 billion in 1983. The booming demand in every category of the Italian computer and peripherals market provides excellent opportunities for U.S. manufactured equipment. The single largest buyers of computers in Italy at this time are manufacturers.

CW International Marketing Services can give you one-stop advertising services in countries around the world. For more information on Computerworld/Italia or any of our other foreign publications, just fill out the coupon below.

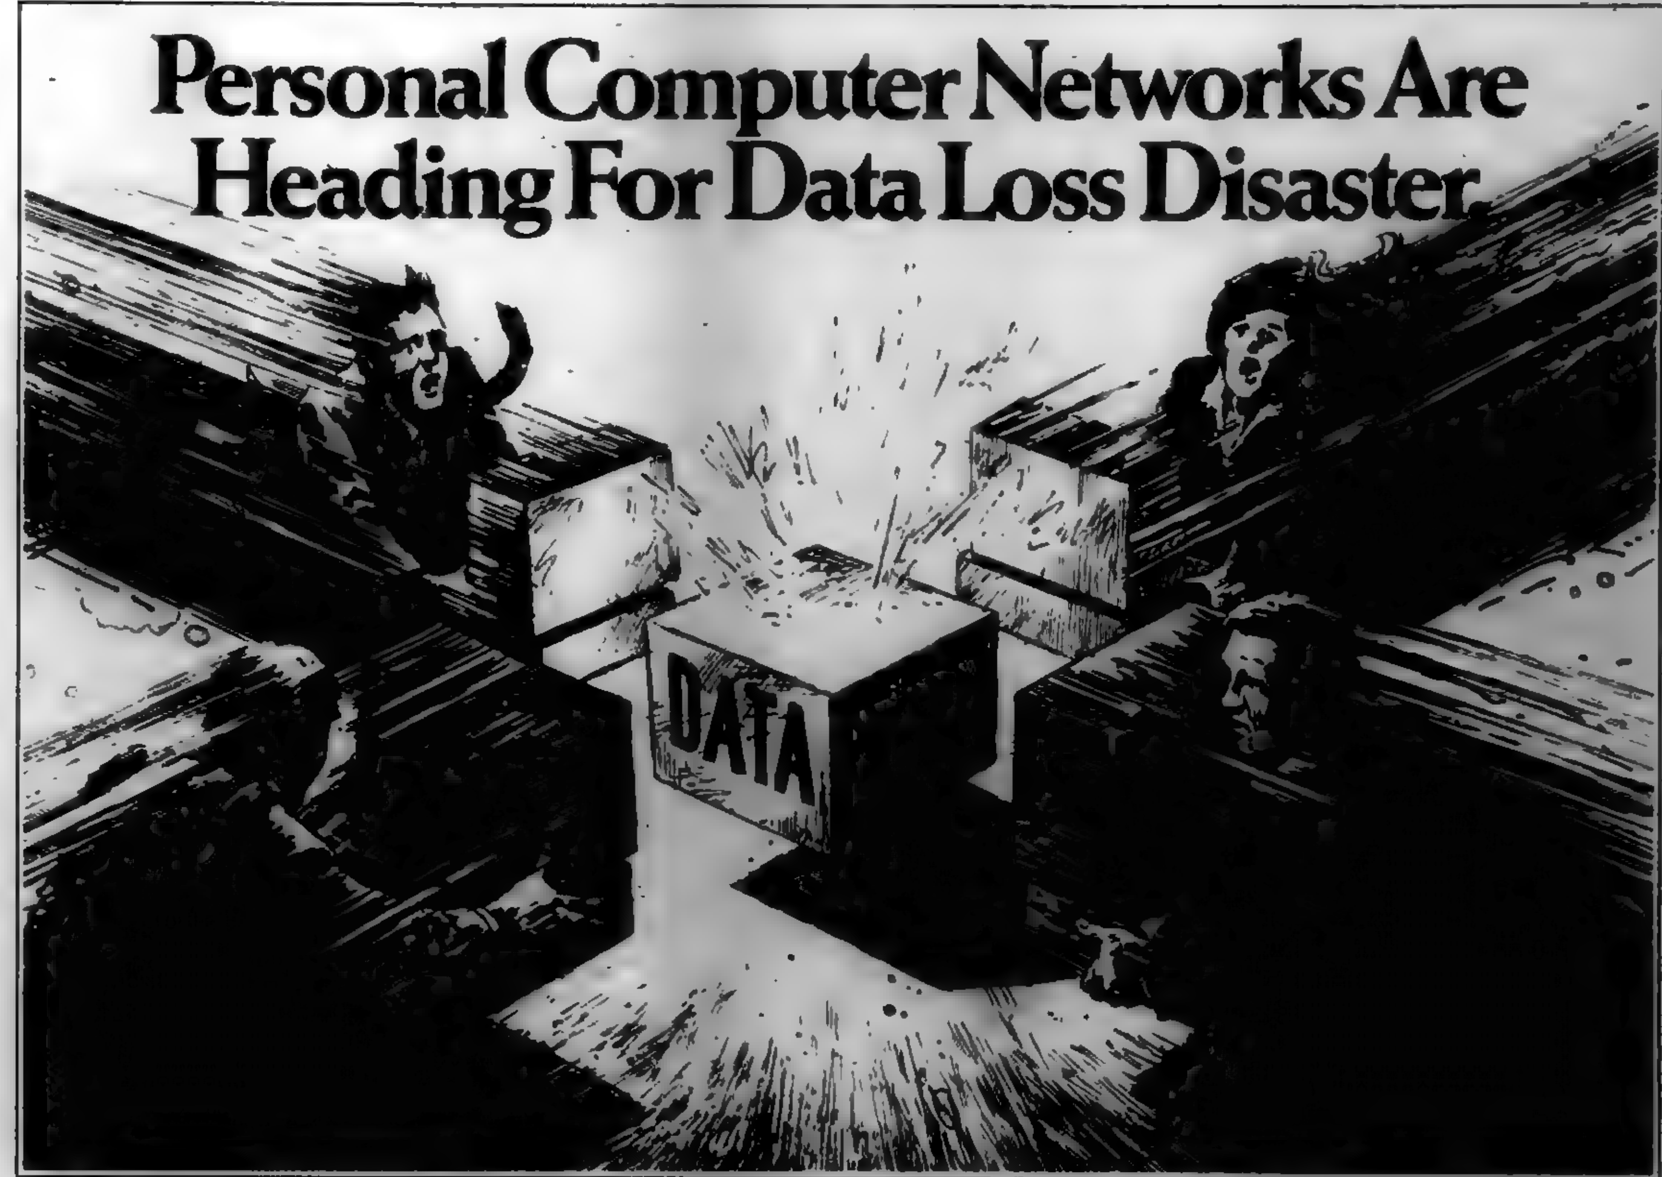
Personal Computer Networks Are Heading For Data Loss Disaster.



INTRODUCING THE SOLUTION. DATASTORE:™lan.

The database management software that prevents costly data loss when several users share the same data.

Hardly anyone knows about it until it happens. And then it's too late. There's a collision. An entire database is destroyed. Vital records and information are lost. And untold dollars and man-hours are required to replace them. An entire business is thrown into chaos.

Why does database destruction occur? Because today's leading database management systems were designed for single users only. So when you have more than one employee accessing the same database, look out.

Happily, there is now a simple solution to this serious problem—DATASTORE:lan, the first software designed specifically for personal computer networks. DATASTORE:lan puts an end to data loss once and for all. And, it offers many other sophisticated database advantages as well:

- SECURITY AND PRIVACY unheard of in single-user database systems. It permits selective access to sensitive information, screening out all those who should not see it. You can even protect data down to the field and record level with DATASTORE:lan.
- BUSINESS-SIZE CAPACITY for growth. It provides up to 16 megabytes of information per database with no limitation on the number of records, and each record can be up to 16,000 bytes with over 500 fields. In addition, there are 16 key fields, and you can join up to 15 different databases. Obviously, single-user systems pale by comparison.
- EASILY COMPATIBLE. If you are currently using single user database management software there's no need to re-enter files when you upgrade to DATASTORE:lan. Compatible with leading database management software including dBase II™ and PFS:file.™
- EASIER TO USE than virtually any other database product on the market. A step-by-step menu leads any user easily through the program.
- AVAILABLE for IBM PC and compatibles, TI Professional and all leading networks including Corvus, 3Com, Nestar, Novell, Davong and PCnet.™

If you don't want to gamble with your company's data, call us or write to find out more about DATASTORE:lan. Or stop in to Businessland, participating ComputerLands, Entré Computer Centers, or other major retailers.

For more information, a full-function demonstration disk, or the dealer nearest you, call toll-free:

1-800-LAN-DBMS

or 1-800-LAN-DATA in California.

GO FOR THE BEST, REGARDLESS OF COST EVEN IF IT'S CHEAPER.

There are some people who wouldn't buy a Rolls Royce for a buck-ninety-five if it didn't come with a hood ornament.

Mercifully, there are other people: those who purchase things (like computers) because of logic, rather than insecurity.

For those, we offer this chart showing how the Leading Edge Personal Color FXD Computer differs from the IBM* XT, not a self-serving litany of trivial distinctions, but a straight-up comparison of basic things of righteous concern.

After you read it, bear in mind that any consequent action you take requires only admirable lack of cowardice.

	THE LEADING EDGE™ PERSONAL COLOR FXD	**THE IBM XT WITH COLOR OPTION**
Display	Full color display standard	Color monitor—$680. Color controller—$244.
Memory	256K Standard	256K Standard
Speed	7.16 MHz and 4.77 MHz Standard	4.77 MHz Only
Expandability	Expandable to 640K No additional boards	Expandable to 640K Must add two boards
Graphics	Capability Standard	With Color Monitor and Color graphic board
Ports	Both Parallel and Serial Standard	Serial Standard, Parallel optional—$75.

Comdex host to myriad micro debuts

Show features few surprises

By Eric Bender
CW Staff

LAS VEGAS — While Comdex/Fall '84 saw hundreds of new microcomputer products fighting for the spotlight, the giant computer reseller show produced few major announcements and no blockbusters.

Unlike last year's show, when competing announcements of IBM Personal Computer-compatible systems and windowing software packages held center stage, no high-profile introductions dominated the conversation at Comdex/Fall.

The predicted crop of IBM Personal Computer AT-compatible machines did not materialize, but the show did display scores of new

DEC users get head start implementing Cobol-80

Supporters of proposed standard cite improved readability, maintainability, coding productivity

By Paul Gillin
CW Staff

As the computer industry continues its vigorous and lengthy debate over the nuances of the proposed Cobol-80 standard, a sizable body of Digital Equipment Corp. VAX users has been busily coding, using a compiler based on the unratified version. In recent interviews with *Computerworld*, several of these users praised many features of the new language and added that conversion from existing Cobol-74 programs has posed few or no problems.

Most users pointed to improved readability and ease of maintenance as the main benefits of the new implementation. They specifically said several new verbs, such as in-line PERFORM and EVALUATE, have improved coding productivity. In addition, other features that allow files to be defined externally have enabled programmers to write more modular and flexible code, they said.

"I'd guess we save 20% to 25% in development effort over Cobol-74, mostly because debugging and logic are easier," said Tom Sprawls, president of Gray Matter, Inc., a Phoenix-based systems house that does data processing for 10 companies. "Writing in Cobol-74 is a pain in the neck. But Cobol-80 has eliminated virtually all of the problems," he said.

Thury O'Connor, vice-president of Lexi-Comp, Inc., a small Hudson, Ohio-based software services, programming and facilities management firm, said,

Sperry ties systems to Unix

Also releases supermicros, software at Comdex

By Edward Warner
CW Staff

LAS VEGAS — Sperry Corp. introduced AT&T's Unix operating system to most of its product line in one fell swoop here at Comdex/Fall '84 last week. It announced that Unix versions would be provided for nearly all of its computers, from its personal computers up to its 1100 mainframe series.

Along with that announcement, Sperry revealed its Series 5000 Unix-based supermicrocomputers and factory and office automation software to run on them.

At the low end, Sperry's implementation of Unix for its personal computers will come via Microsoft Corp.'s Xenix 3.0 Unix derivative. At the high end, the 1100 series will gain an AT&T Unix System V operating system called SX 1100.

SX 1100, priced at $1,000 to $1,500 per month, will reportedly execute as an application on the machine's 1100 OS standard operating system, providing access to 1100 OS formatted files. It will also reportedly be able to maintain multiple concurrent SX 1100 environments, each with its own file system.

Sperry will offer Xenix 3.0, meanwhile, for its Models 40, 45 and 50 Personal Computers and the hard-disk version of the Sperry Portable Personal Computer. It is said to require 512K bytes of random-

A license to save on software

By Paul Gillin
CW Staff

SAN DIEGO — North American Philips Corp. has found a novel and efficient way to save hundreds of thousands of data processing dollars. It licenses only one copy of each of seven financial software packages and makes them available to its 19 subsidiaries.

In that manner, North American Philips not only saves licensing costs, but also employs a much smaller maintenance and education staff for its widely diversified business. In fact, it needs only 11 people to support the applications software for 19 subsidiary companies, explained Kenneth Ary, a financial package coordinator for North American Philips. Ary, who is based at Philips' offices in Itasca, Ill., estimated the company saves 65 programmer-years per year under the arrangement. Ary was interviewed at the 15th Software International Users Group meeting held here last week.

There is nothing illegal about the arrangement. Divisions simply load executable versions of the software into their on-site mainframes from the firm's New York data center for on-line data entry. The data is then formatted to update the data bases at the local sites. Not only does the company save money, but the arrangement also allows it to install new

IRS seeks system to monitor media reports

By Mitch Betts
CW Washington Bureau

WASHINGTON, D.C. — The Internal Revenue Service is advertising for an "on-line automated media diagnostic system" that would help IRS press officers do a better job of feeding the news media statements on federal tax regulations.

The computerized system the IRS has in mind — and which officials concede may not exist — would monitor print and broadcast reports to see if the IRS message is getting across to U.S. taxpayers, according to IRS officials and documents. The agency is now searching for a private firm with media analysis experience that can supply such a system.

"Since we don't own the media, we need to find out how best to reach them and communicate with them," said Mike Williams, an analyst with the IRS taxpayer information program. The system is expected to "measure changing IRS objectives and messages . . . against what was actually used [by the media]," an IRS statement said.

For example, the "media diagnostic system" could help press officers determine which publications actually use IRS press releases and identify what format or timing changes are needed to get the information reported, Williams said.

Asked if the system would be used to manipulate the press, Williams responded, "That's why it's called 'media diagnostic system' and not 'media management system.' . . . The opportunity for abuse is out there, but that's not what we intend to do."

> *'The opportunity for abuse is out there, but that's not what we intend to do.'*
> — Mike Williams, IRS

In a solicitation published in the government's *Commerce Business Daily*, the IRS said it seeks an "operational, on-line, automated media diagnostic system for 85 sites throughout the nation that will allow IRS management to determine the effectiveness of its nationwide taxpayer information program."

The IRS said the computer system should supply detailed statistical reports and graphics that will help IRS management measure "the impact of IRS materials on the media, the value of media coverage, the type of audiences reached, media news preferences, the need for localization of media releases and the best distribution methods."

Furthermore, the IRS said, the system must provide categorized mass media listings and must be available to users — the press officers — seven days a week, 24 hours a day.

Williams said the IRS apparently is the first federal agency that has tried to automate its media relations effort. "We're pioneering in this area," he said.

But Williams said it remains an open question whether the solicitation will turn up any vendors that can supply the computer system the IRS wants. If none surfaces by early December, the plan will be dropped, according to Hiram Wilcox, an IRS contracting officer.

Williams stressed that the automated system would help the agency's 63 public affairs officers communicate more efficiently and effectively with the nation's 40,000 media outlets.

Datapoint rolls out 32-bit supermicro

By John Desmond
CW Staff

LAS VEGAS — Datapoint Corp. last week announced a 32-bit supermicrocomputer for the office automation market based on dual microprocessors and featuring a Unix look-alike operating system.

Called the Datapoint 3200, the supermicro uses dual Motorola, Inc. 68000 microprocessors and runs Charles River Data System's Unos AT&T Unix-like operating system. It allows connection of up to 28 terminals.

The 3200 is compatible with Datapoint's Attached Resource Computer (ARC) coaxial-cable local-area network and supports Ryan-McFarland Corp.'s RM/Cobol relational data base management system.

In the 3200 hardware, one 68000 processor with a 4K-byte cache memory is dedicated to all applications processing; the other is dedicated to I/O operations, a feature said to result in better response time. Main memory is expandable to 8M bytes, and on-line storage is expandable to 152M bytes, according to the company.

The 3200 interfaces with the ARC network via Datapoint's Intelligent Network Executive-32 (INX-32) Adaptor, an optional internal card and accompanying software. Software utilities reportedly allow ARC users to perform tasks in the Unos context and use the results in their own applications.

The Unos operating system is said to provide file management facilities including multitasking, device-independent I/O, I/O redirection, dynamic file allocation and hierarchical directory structure.

Software options available include the C programming language, RM/Cobol and Databus, Datapoint's business programming language. These are said to provide access to many independently developed application packages. RM/Cobol, previously unavailable on the ARC, is said to allow users to maintain single entries of data and to access required information from a single source.

Ace Microsystems, Ltd.'s LEX word processing program and Microsoft Corp.'s Multiplan spreadsheet are also supported by the 3200, the company said.

An entry-level 3200 includes 1M byte of memory, 32M bytes of disk storage with 1M byte of diskette storage, a 4K-byte cache memory and four serial ports. A choice of three types of terminals, three types of printers and a communications adaptor to emulate IBM's 2780/3780 protocols is available.

The base system is priced at $15,430. The price for Unos is $1,000 and for the INX-32 Adaptor with software, $2,500. The system is available 90 days after order, the vendor said.

Datapoint is located at 9725 Datapoint Drive, San Antonio, Texas 78284.

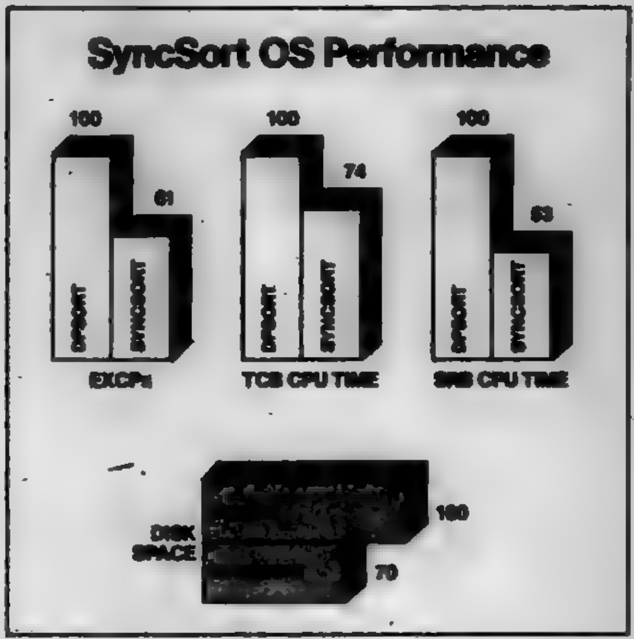
THE BEST COMPOSER SHOULD HAVE THE BEST PIANO

What could be more fulfilling in life than to realize one's absolute potential? And what could be sadder than to fail for lack of the proper equipment?

"Rousing Performance"

SyncSort allows you to perform like a virtuoso, drawing out the best your ***IBM Mainframe*** has to give.



If OS isn't your tune, you'll find our CMS and DOS performance equally impressive.

"Impressive Backstage Support"

Our Technical Service people, resolving more than 85% of all requests for technical service within 24 hours, will make you look like a star. A recent independent survey showed that 97% of SyncSort's users rate our product reliability as Very Good or Excellent.

"Harmonious Features"

SyncSort's features will impress even the most jaded impressarios, increasing programmer productivity and operational flexibility.

- Sortwriter—displays sorted data in user-tailored reports. Programmer efficiency is maximized through flexible report formatting of headers, trailers, sectioning, totals and subtotals.
- Multiple Output—provides multiple copies of the sorted output file. Each output file can be any subset of the full sorted output, and you can produce a different report format for each output file based on user-specified criteria.
- Record Editing—allows insertion of literals, commas, $, etc. as well as editing, repositioning or elimination of record fields, thereby reducing programming time.
- Fast File Copy—dramatically reduces the consumption of mainframe resources. All standard sorting features (Include/Omit, Inrec/Outrec, Sum, etc.) as well as SyncSort's unique features can be activated in a normal copy operation.
- Maxsort—provides powerful operational flexibility in sorting very large files. Sorting of these files is automatically broken into optimal steps, executable at different times; thus, the amount of data that can be sorted is no longer restrained by the amount of disk space available.

Early user harbors ambitious plans for IBM's DB 2

FIRST USER

By Paul Gillin
CW Staff

The Buick Motor Division of General Motors Corp. is plunging headfirst into relational data base management, and its product of choice is IBM's DB 2.

With more than 20 months of DB 2 experience under its belt, Buick is ready to start using the data base management system (DBMS) on some ambitious applications (see story below)."I think DB 2 will get a serious look from now on for every application," said Lowell Watson, administrator of new technology studies at Buick.

The first release of IBM's long-awaited relational DBMS has some shortcomings, Watson said, but he is largely pleased with both its performance and features. "We're happy with it. The code is clean, and it's very good for such a young system and a large system," he said.

DB 2 has the greatest potential for prototype development of end-user-type applications that require frequent query and report writing. "Programming productivity is definitely up," he said. "You have more interaction with the customer, and at the end, you're much more likely to have something he's happy with than in the traditional life cycle approach. It's much more forgiving [than IBM's IMS] in the way you put the data base together."

However, he said, Buick is not planning to move any major applications to DB 2 from IMS in the foreseeable future.

The focus of DB 2 usage at Buick is a large production program used by the personnel department to handle sickness and accident claims. The system tracks claims and actions taken on those claims and maintains a six-month history file of time and attendance data. It also has extensive query facilities using the Query Management Facility utility of DB 2 and includes a tickler file for claims analysts. Written largely in PL/1, the program uses files extracted from three IBM Vsam data bases loaded into a fourth production file that is maintained solely on DB 2.

Currently, the time and attendance data base consists of 1.5 million records. When the history file is complete, it will comprise about 2.5 million records. "So far, we're confident it can handle this application up to 2.5 million rows. We are getting 3 to 5 second response times," Watson said. However, he stressed, "You have to remember we're not updating that table. It's just being queried by the applications program or by the user."

Examining DB 2 limits

Buick is bound by a nondisclosure agreement not to discuss specifics of DB 2 performance, but Watson said, "We are working heavily in that area. We're trying to figure out how far we can push [DB 2]," he said.

"Performance has to be worked on and IBM knows that," he said. "IBM will tell you that in the first release they did not work on performance. The main thing was to make the code clean and make it do what they advertised. They're saying the next release is going to concentrate on performance."

The biggest area of concern is in updating. Watson said Buick has not tried updates on tables larger than 100,000 records. However, "It's clear we can handle all that stuff down in the hundreds of thousands," he said.

So far, extracts have come primarily from Vsam files using IBM's DXT data extract facility. "DXT is a pretty good extracting tool for getting data out of Vsam or IMS or other kinds of data collections if the data is laid out flat," Watson said. "The language you use is a Sequel-like language. It picks data up with great selection. However, when it lays it down, there are no choices you can make about how the updates are done. So in some cases, we have to write some PL/I programs where we have to do some more selective kinds of updates."

Buick had considered several fourth-generation languages in its initial foray into relational processing. But Watson said the relative weakness of the data base handling was a factor against them. "We were looking for something more fundamentally different and structured, not the best report writer on the market," he said.

DB 2's use of SQL was a major factor. "I've been trying to convince other people that it's best for the whole industry to standardize on a language," Watson said. "[SQL] looks like a reasonable standard, and IBM will make it a standard anyway. Why go off on one of these tangents for a while and then come back?"

Once inside DB 2, Sequel Processing Using File Input (Spufi) can be used by programmers in application development to insert data base queries. "If you're writing a program in PL/I and you're editing the file, you can split-screen to your Spufi session and then write the query that you think is appropriate to be included in your program," he said. Buick uses Spufi in an IBM Interactive System Productivity Facility environment for DB 2 development.

Watson said DB 2 has imposed no limits on the variety of record types that programs can use. "You cannot support a one-bit kind of record type that you could in PL/I," he said. "But you have fixed-length character, variable-length character, packed, small integer and float. Most of the data types you have in PL/I you have in DB 2."

Watson said DB 2 is a good first release but needs some enhancements. Buick presented a large document of proposed additions and modifications to IBM at a customer roundtable last year. Watson said IBM appears to be tackling most of the significant needs that were expressed.

Want to stay competitive? Add chief information officer

CHICAGO, Ill. — Chief executive officers and chief operating officers who want to remain competitive will have to incorporate a new title into their management system, according to Arthur Andersen & Co.

In a handbook for executives entitled "Trends in Information Technology: 1985," the accounting firm predicts that the emergence of the chief information officer at the top executive level is essential to survival.

"The corporate role in establishing an information infrastructure and in setting policies and standards for its use must increase," said P. Declan O'Riordan, a senior partner who directed the preparation of the executive handbook.

"With the decentralization of the traditional MIS group, new systems development methods and the rapid convergence and overlapping of technologies, one senior official should be able to correlate information technology and business strategy for the organization's advancement," O'Riordan said.

Along with the emergence of the information executive, the firm predicts an increase in the use of information systems as marketing tools.

Arthur Andersen plans a monthly update of the free handbook which can be obtained at any local Arthur Andersen office.

Second-class postage paid at Framingham, Mass., and additional mailing offices.

WHEN THE CHAIRMAN EXPLODES OVER A SECURITY LEAK, WHAT'S YOUR DEFENSE?

VMCENTER:

THE ONE INDISPENSABLE SURVIVAL TOOL FOR VM DATA CENTER MANAGERS.

It doesn't matter who actually leaked it—if there's a failure in system security, it's *your* problem.

But now, at last, you have an ally. In VMCENTER.

VMCENTER puts you squarely in control of system resources—providing multiple levels of authorization, for maximum protection against security violations.

It also allows you to do a lot more. Change passwords in a flash, encrypt data through simple commands, and keep top management informed of potential problems through a variety of reports.

Best of all, VMCENTER makes *you* secure—knowing that problems are being taken care of *before* they happen, not after.

But there's more.

In addition to security problems, VMCENTER solves a lot of others, like disk and tape management, resource scheduling and accounting, even workload balancing. And it does it all in an integrated manner that's more effective than any possible collection ofquick fixes.

VMCENTER. It's a survival tool —and then some. Once you use it, you'll wonder how you ever got along without it.

And the Chairman may even learn to feel the same way about you.

For more information on VMCENTER, call or write VM Software, Inc., 2070 Chain Bridge Road, Suite 355, Vienna, Virginia 22180, telephone (703) 821-6886.

Lotus offers software for Apple's Macintosh

Jazz package targets corporate users; functions resemble Symphony's for IBM's micro

NEW YORK — Lotus Development Corp. introduced last week its Jazz five-function integrated software package for the Apple Computer, Inc. Macintosh in a move designed to entice corporate users to embrace Macintosh.

Jazz reportedly offers functions found in Lotus' Symphony package for the IBM Personal Computer, including word processing, spreadsheet, data base management, communications and business graphics, but Lotus Chairman Mitchell D. Kapor stressed that Jazz is "in no sense a rework or expansion of [Lotus'] 1-2-3 or Symphony."

Priced at $595, Jazz will reportedly be available in March 1985. It will run only on the 512K-byte version of the Macintosh, introduced in September, and requires a second disk drive, priced at $495.

Jazz reportedly allows users to execute functions using the pull-down menus common to Macintosh software in conjunction with either the machine's keyboard or the Macintosh mouse. Each application is said to function either as a stand-alone program or as an integrated, and even windowed, program within other applications in the package.

For that reason, Kapor refused to specify how much internal memory the program occupies, saying "how much room you have is a function of what [application] you're doing with it."

Jazz's communications program reportedly supports Digital Equipment Corp. VT100 and VT52 terminal emulation and can also convert Multiplan, 1-2-3 or Symphony files, transmitted from the IBM Personal Computer to the Macintosh, into a format that Jazz can use.

> *'Macintosh has had zero momentum in the corporate marketplace, but Jazz will make [the Macintosh] a more attractive offering without a doubt.'*
>
> — Tony Morris, Morris Decision Systems, Inc.

Calling Jazz a product "for the forgotten managers of business, for those users who are not spreadsheet junkies," Apple Computer President John Sculley told the 300 or so who attended the introductory press conference that Jazz will come to have the same impact as Software Arts, Inc.'s Visicalc and Lotus' 1-2-3.

Financial analyst Scott Smith of the Gartner Group, a market research firm in Stamford, Conn., meanwhile, acknowledged that Lotus is "positioning [Jazz] very strongly for the corporate world," but wondered if corporate users really want integrated packages at all.

The cafeteria approach

His firm's research, he said, shows they prefer what he called "the cafeteria approach" of chosing selected software applications that can share data, particularly in a windowed environment.

"The [Macintosh] is out of the woods," as far as sales to corporations go, said retailer Tony Morris in reaction to the announcement.

Morris, whose New York-based Morris Decision Systems, Inc. sells personal computer hardware and software solely to corporate clients, said that, so far, "Macintosh has had zero momentum in the corporate marketplace," but that Jazz "will make [the Macintosh] a more attractive offering without a doubt."

COBOL

from page 1

"When I had a choice in the past, I have always gone toward a scientific language like Fortran or Algol. I developed a strong anti-Cobol bias. But I'm surprised and satisfied with Cobol-80. We've been able to do everything we wanted to do."

Users said Cobol-80's new EVALUATE verb, which allows for testing of multiple conditions and specification of multiple control branches, has been one of the most helpful features of the new implementation.

"We've found that after you get past three levels of IF statements, nobody can keep up with where you are," Sprawls said. "EVALUATE eliminates having to write a lot of IF statements."

O'Connor said the EVALUATE statement has enhanced readability and maintainability of Cobol code. "It's also very economical of characters," he said. "Because of built-in control, I can use selection alternatives and not have to bury them in a bunch of IFs and GOTOs."

The new procedure cuts down on the complexity of debugging programs containing many IF statements, Sprawls said. Previously, a single period could end a series of nested IF statements. In Cobol-80, internal IFs can be ended with an END statement without affecting external IFs. "If it's [3 a.m.] and your payroll's down, it can drive you crazy looking for that little period," he said. "That's been eliminated in Cobol-80."

Users said EVALUATE and in-line PERFORM are so useful that they rewrite Cobol-74 programs whenever possible to take advantage of the new statements. "When you PERFORM a section, it executes a whole section of code," said Nancy Torok, a programmer/analyst at Amax Copper, Inc., a metals trading company in Carteret, N.J. "That makes it easier to document."

A particularly useful new feature for Amax's shop has been the advance ACCEPT and DISPLAY commands. The DISPLAY statement now can be used to display a message and add a new phrase at the end with no advancing.

Control over prompts

"The old system was a prompt and response mode that proceeded line-by-line," Torok said. "In this new way, you can choose how you want the prompt to be displayed, specifying lines and columns. That's useful for prompting on data input screens. Now you can do that in a full-screen mode."

Sprawls has found the new PERFORM WITH TEST AFTER statement to be useful in eliminating problems caused by unfinished subroutines. If any subroutines are accidentally left open, they are closed when the program is exited. "That was a real 'gotcha' in Cobol-74," he said. "I'd say 20% of the bugs I've run into have related to a flag that hadn't been cleared."

Two users found the new REFERENCE MODIFICATION statement useful because it allows individual characters within a string to be accessed from the procedure division without having to be defined in the data division. "This feature is invaluable to us," O'Connor said. "In effect, it allows us to treat substrings of long fields just as if they were part of a standard reference definition. The reference-modified fields are indistinguishable from regular fields."

Nesting whole programs

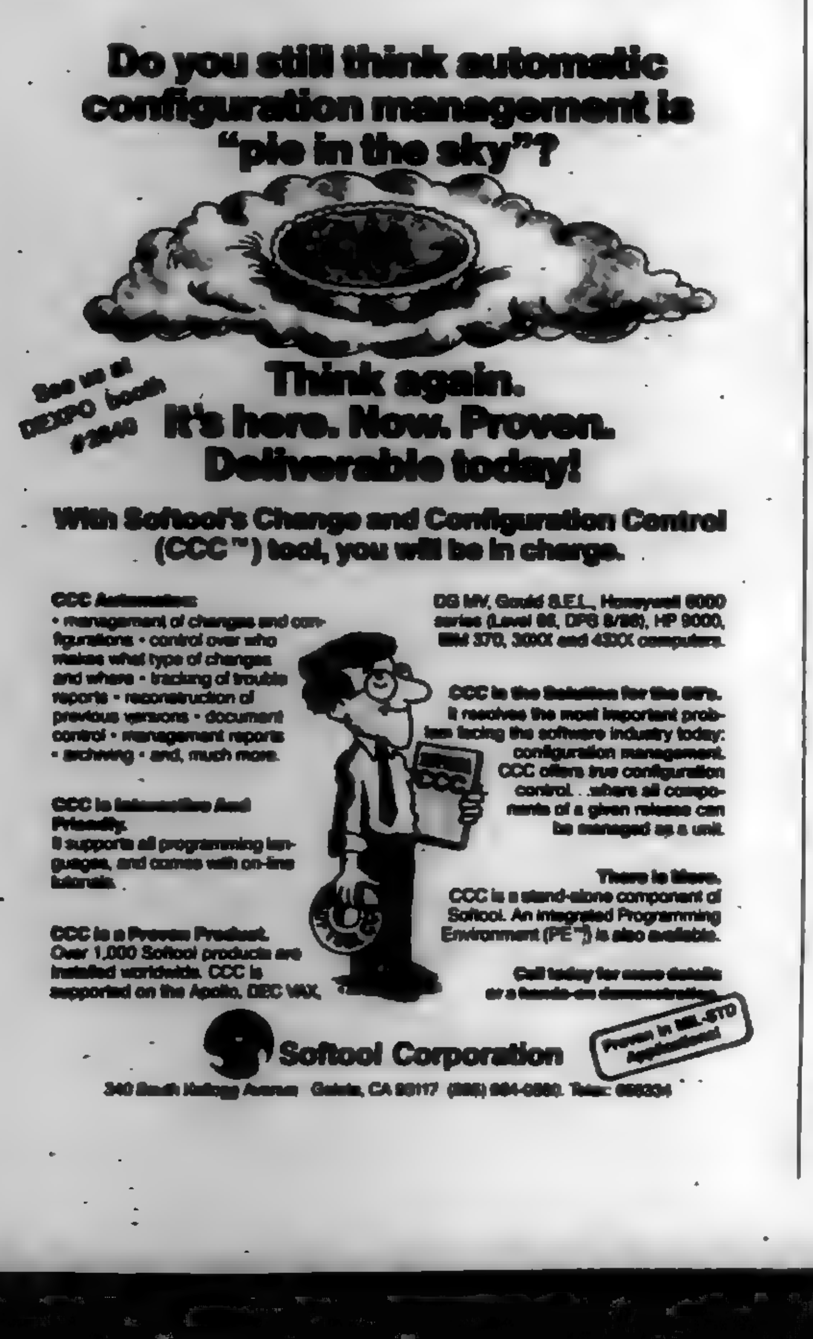
Cobol-80 also contains new procedures for nesting whole programs, a feature that can be used to construct more modular and maintainable applications, users said. When this is combined with VAX VMS features, "you can write a large system with a lot of program modules that call each other and bind on the fly into one image," Sprawls said. "It makes it possible to write applications in a very modular form."

O'Connor said the capability provides the means to share data and pass parameters between calling and called programs.

"Complete programs can be contained in other programs and also executed as separate programs," he said. "They behave as independently compiled programs although you keep and maintain them as a single unit."

Users unanimously said they had experienced few problems in running existing Cobol-74 programs on the new compiler.

"If you want to write Cobol-74 using the Cobol-80 compiler, you can do it. There's even a flagger that will show you where you're departing from it," Sprawls said. "But if you do so, there are a lot of new and great things available now that you will be missing."



Do you still think automatic configuration management is "pie in the sky"?

See us at DEXPO booth #2840

Think again.
It's here. Now. Proven.
Deliverable today!

With Softool's Change and Configuration Control (CCC™) tool, you will be in charge.

CCC Automates:
• management of changes and configurations • control over who makes what type of changes and where • tracking of trouble reports • reconstruction of previous versions • document control • management reports • archiving • and, much more.

CCC is Interactive And Friendly.
It supports all programming languages, and comes with on-line tutorials.

CCC is a Proven Product.
Over 1,000 Softool products are installed worldwide. CCC is supported on the Apollo, DEC VAX, DG MV, Gould S.E.L., Honeywell 6000 series (Level 66, DPS 8/88), HP 9000, IBM 370, 30XX and 43XX computers.

CCC is the Solution for the 80's.
It resolves the most important problem facing the software industry today: configuration management. CCC offers true configuration control. . .where all components of a given release can be managed as a unit.

There is More.
CCC is a stand-alone component of Softool. An Integrated Programming Environment (PE™) is also available.

Call today for more details or a hands-on demonstration.

Proven in MIL-STD Applications

WASHINGTON UPDATE
Mitch Betts
CW Washington Bureau

VA program identifies benefits overpayments

WASHINGTON, D.C. — The Veterans Administration (VA) this month began a computer matching program to detect overpayments of veterans, benefits, such as pensions and educational aid.

The VA Inspector General's Office said it will match its benefit records with vital statistics records kept by 47 states (three states lack automated records) to "identify recipients who may be ineligible or not fully entitled to such benefits." For example, the VA noted that the spouse of a disabled or deceased veteran is not entitled to full benefits in the event of a divorce or remarriage.

In other recent announcements required by the Privacy Act of 1974, the government said:

- The Federal Bureau of Investigation's National Crime Information Center will routinely disclose information about missing children to the National Center for Missing and Exploited Children.
- The U.S. Department of Energy will routinely disclose health information about employees handling radioactive materials to the National Institute of Occupational Safety and Health for studies on radiation exposure.

Florida residents to test OMR 1990 census forms

WASHINGTON, D.C. — The U.S. Bureau of the Census plans next year to test census forms that can be read by optical mark recognition (OMR) scanning equipment in an effort to evaluate automated processing methods for the 1990 census, according to Census Bureau documents.

The bureau said it will test the OMR census forms in March 1985 in Tampa, Fla., as part of a pretest for the nationwide census in 1990. Eighty percent of the Tampa households sampled will fill out the OMR form, while 20% will use the regular census form that requires clerical data entry for computer tabulation.

The OMR form requires respondents to use a No. 2 lead pencil to blacken circles corresponding to the correct answer.

Air Force plans AI system to diagnose aircraft ills

WASHINGTON, D.C. — The U.S. Air Force plans to develop a prototype artificial intelligence system for aircraft maintenance that is expected not only to assist with repair diagnosis, but also to help train new mechanics, officials announced recently.

The announcement from the Training Systems Division of the Air Force Human Resources Laboratory at Lowry Air Force Base in Colorado said the research project will develop a diagnostic expert system with features that would help apprentice mechanics learn the problem-solving techniques of master mechanics.

The Air Force plans to award an R&D contract next summer. "The goal of this research is to design, develop, demonstrate and [make the transition to] artificial intelligence technology, which integrates automated diagnostics, maintenance technician expertise and maintenance information data bases," the statement said.

The system would draw on data bases generated by a computer-aided design and manufacturing system as well as the heuristic knowledge of expert technicians, according to the announcement.

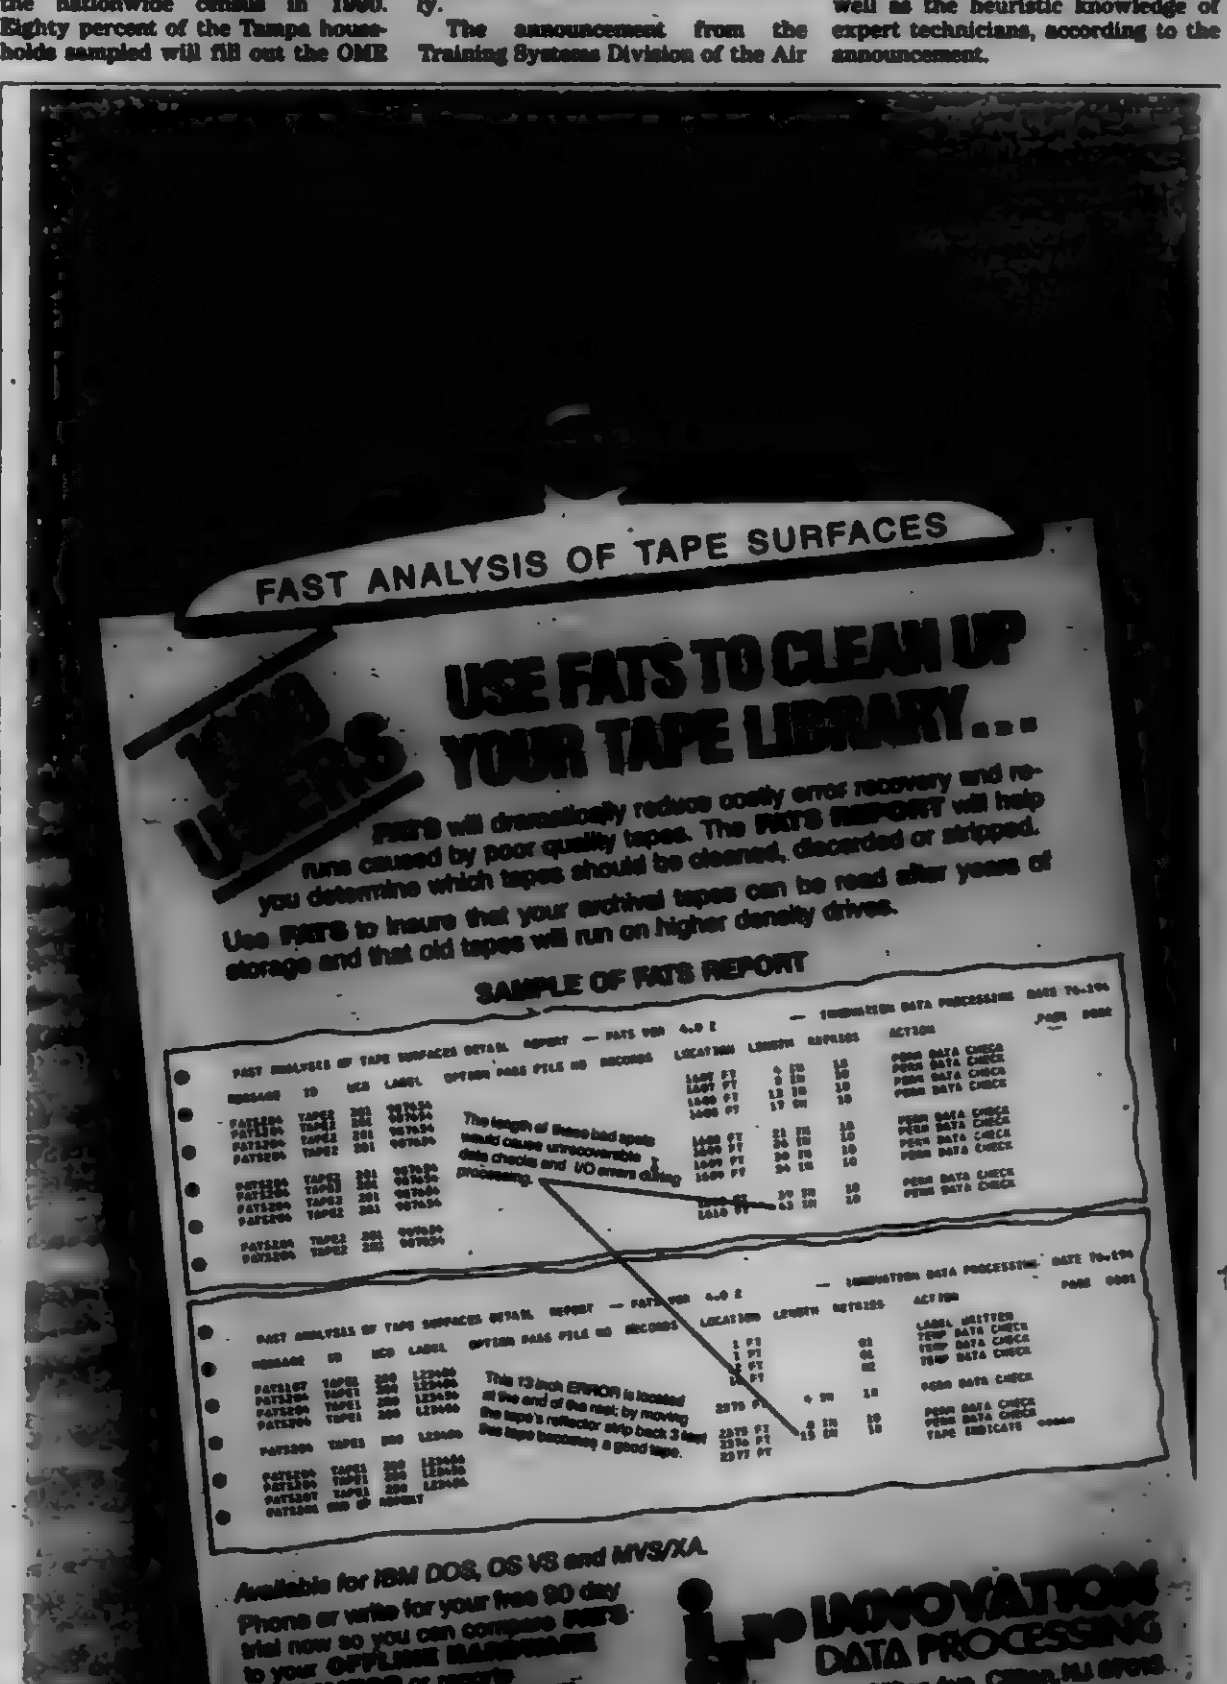
AT&T exec to address conference

BALTIMORE, Md. — Donald Procknow, vice-chairman of AT&T Technologies, Inc., will deliver the keynote address — entitled "Doing Business Electronically" — when the World of Electronic Data Interchange — 1984 Forum and Exhibit convenes at the Convention Center here Nov. [redacted]

The conference, sponsored by the Transportation Data Coordinating Committee (TDCC), will focus on the latest developments in computer and communications applications that use the Electronic Data Interchange standards for computer-to-computer transmission of intercompany business transaction data. The sponsor said industry standards and the transmission and receipt of purchase orders, invoices, bills of lading, freight bills, warehouse instructions, shipment status and payment claims [redacted]

Other scheduled speakers will include R. W. DeSio, director of IBM's Corporate Technical Institutes, and Dr. James Boren, president of the International Association of Profes- [redacted] covering topics on planning, programming and the implementation of modern electronic data interchange systems.

Conference registration is $295. TDCC headquarters is at Suite 606, 1101 17th St., N.W., Washington, [redacted]



FAST ANALYSIS OF TAPE SURFACES

USE FATS TO CLEAN UP YOUR TAPE LIBRARY...

FATS will dramatically reduce costly error recovery and reruns caused by poor quality tapes. The FATS REPORT will help you determine which tapes should be cleaned, discarded or stripped.

Use FATS to insure that your archival tapes can be read after years of storage and that old tapes will run on higher density drives.

SAMPLE OF FATS REPORT

The length of these bad spots would cause unrecoverable data checks and I/O errors during processing.

This 13 inch ERROR is located at the end of the reel; by moving the tape's reflector strip back 3 feet this tape becomes a good tape.

Available for IBM DOS, OS VS and MVS/XA.

Phone or write for your free 90 day trial now so you can compare FATS to your OFFLINE HARDWARE EVALUATOR or reports generated by SMF and [illegible]

INNOVATION DATA PROCESSING
970 Clifton Ave., Clifton, NJ 07013
201—777-1940

DP operations managers lead in salary gains

GARDEN GROVE, Calif. — Data processing operations managers are experiencing an increased salary differential this year over other operations managers, indicating "a much higher level within the management hierarchy than previously," according to a forthcoming survey by the Association for Computer Operations Managers (Afcom).

The 1984/1985 Data Processing Salary Survey, based on data from about 180 computer installations nationally, reveals that the salary gap between the DP operations manager, a relatively new but emerging position, and the computer operations manager increased from 16.7% last year to 22.8% this year.

One reason for the increase, according to Afcom President Leonard Eckhaus, "is that a number of data centers across the country are reorganizing their operations, incorporating the position of data processing operations manager."

While DP operations shops were traditionally run by the computer operations manager, the newer position indicates the top DP operations person is now at a much higher level in the DP management hierarchy and is beginning to find salary compensation on a par with programming managers in many companies, according to Afcom.

Salaries for data entry managers and data control managers closed the gap somewhat with the traditionally higher salaries for computer operations managers, a spokesman for Afcom said, indicating "a movement towards more of an equalization of the salaries" for managers grouped under the DP operations manager. The total spread between salaries for data entry, data control and computer operations managers dropped to 21.9% in the most recent survey, from 31.5% a year earlier. Afcom cautioned that "one year's data does not in itself represent a trend."

The top DP operations person is at a much higher level in the DP management hierarchy and is beginning to find salary compensation on a par with programming managers.

Nationally, the monthly salaries for DP operations managers ranged from a low of $1,680 to a high of $7,663. The average monthly salary was $3,301 and the median monthly salary was [illegible].

Regionally, DP operations managers earned a higher average monthly salary in the Northeast, $3,433; followed by the West, $3,310; South, $3,183; and Midwest, $3,128.

Computer operations managers nationally earned from a low of $1,358 per month to a high of $6,256, with an average of $2,547 and a median of $2,434. Regionally, average monthly salaries were highest in the West, $2,747; followed by the Northeast, $2,609; South, $2,367; and Midwest, $2,217. Median salaries were essentially equal in the Northeast and the West.

Data control managers salaries nationally ranged from a low of $1,284 per month to a high of $3,800; the average salary was $2,229 and the median salary was $2,277. Regionally, the average salary was higher in the West, $2,402, than the Northeast, $2,210, but the median salary was higher in the Northeast at $2,385 compared with $2,264 in the West. Average salaries for the other areas were $2,268 in the Midwest and $2,193 in the South.

Monthly salaries for data entry managers ranged nationally from a low of $1,000 to a high of $3,600; the average was $1,989 and the median salary was $1,900. Regionally, the average salary was highest in the Northeast, $2,021; followed by the West, $2,014; South, $1,978; and Midwest, $1,838. The median salary was slightly higher in the Midwest than the South.

Projected salary increases for 1985 averaged 7.5% for DP operations managers, 7.0% for computer operations managers, 6.9% for data control managers and 6.4% for data entry managers.

Data entry staff largest gain

Overall salary increases for all employees in the DP shops rose 7.8% over the previous year, according to Afcom, with the largest increase among data entry employees, 9.2%, followed by data control employees, 8.7%, and computer operations employees, 6.0%.

Of 19 job classifications included in the survey, DP shops reported some difficulty in recruiting for 11 of those classifications. The greatest difficulty was filling the position of scheduler, which was cited by 89.9% of the survey respondents. Other positions were: DP operations analysts, cited by 80%; DP operations manager, 75%; senior computer operator, 68%; data control manager, 66.7%; and data control shift supervisor, [illegible].

The survey, which also breaks down salaries by installation size and for all 19 job classifications, is available for $40 from Afcom, Suite 201, 11601 Brookhurst, Garden Grove, Calif. 92640.

TEST YOUR I-QUME for value

What terminal gives you a superior combination of features and price? And what distributor gives you an in-stock selection of that terminal at especially attractive prices?

If you answered QUME for the terminal and PMS for the distributor, your I-QUME is in the superior range. Together, QUME and PMS provide the performance solution at the perfect price.

Flexibility
Each QUME terminal is designed with a host of exceptional features. And each offers you options for even greater flexibility. Even better than that, PMS will modify and customize your QUME terminal to provide the best match for your requirements.

Responsiveness
QUME responds with operational versatility and operator comfort and convenience. PMS adds to QUME's responsiveness with a comprehensive service package that includes consultation and analysis, immediate delivery and a toll-free service line.

Affordability
Each QUME terminal offers more standard features for a lot less money. And for a limited time, from November 1 to December 31, 1984, **PMS has the best price on QUME terminals in the country.** Just call and put us to the test.

releases of the applications in much less time.

Ary's group administers the company's Software International Corp. applications, including general ledger, fixed assets and accounts payable. Other groups within North American Philips perform similar functions for a Uccel Corp. Carms accounts receivable system and Insci Corp.'s payroll and human resources software.

The arrangement works like this: North American Philips maintains two IBM 3081 mainframes running IBM's VM operating system at its New York data center. The data center also runs 14 copies of IBM's DOS operating system under VM, as well as a copy of IBM's OS operating system. The widely scattered divisions of North American Philips each maintain their own IBM mainframes, but without any copies of the applications running locally.

Instead, the New York data center maintains core image, source statement and relocatable libraries of the applications at the New York site. When a division wants to update its financial files, it downloads a runtime module of the application over leased or dedicated lines to its mainframe for on-line data entry.

When the update is completed, the data goes through a monitor that Philips wrote in Cobol. The monitor is basically a data collection utility that takes the update data and creates the IBM JCL for batch update. "The user doesn't have to figure out what to run and in what order," Ary said. "The conversion program takes that over for him."

The batch updates are done directly into the user's data base, which is maintained locally. In this way, the users own their data, but not the applications needed to use it. Users do run some of their own applications locally, but the "bread and butter" financial data is all handled through the remote linkup.

Ary explained that the procedures ease the process of converting to new versions of the applications software. But because 19 divisions will use the package, the new releases must be tested much more thoroughly. "If something isn't tested very well, it can bring everyone down," Ary said.

North American Philips uses an internal beta site approach. When a new release comes in, it is tested using a copy of production data extracted from the chosen beta site. The software is then retested against a file of errors that have been found in the past.

Then the beta test site is brought up on the production system under the administration of the application support staff and runs for 30 to 60 days. A duplicate global library containing the new version of the software is kept and run parallel with the previous version. Moving a division over to the new release is as simple as switching pointers, Ary said.

The divisions are notified well in advance of conversion to a new release, Ary said. Staff members from the application support group travel to the divisional locations to train users in the new features of the software. "The easier we can make the system for the users, the happier they'll be," Ary said. "We want the users to know something about data processing, but as little about the complexities of the system as necessary."

User, DP cooperation key to package's productivity

CW AT SI
USERS GROUP

By Paul Gillin
CW Staff

SAN DIEGO — When installing a new financial application package, "the real concerns are not the big heavy technical ones. They have to do with people working together."

That was the essence of a presentation by Carl Coulter, a systems planning consultant in corporate business systems development at McGraw-Hill, Inc. in New York, at the 16th Software International Users Group Conference held here last week.

Coulter, who has been involved in several installations of packaged software, said a financial software installation project differs markedly from that of standard DP applications. "General ledger is very much an accounting system, and the goals of those people in accounting often don't coincide with the goals of DP," he said.

'My system,' not 'your system'

A major goal of the DP staff should be to have the user referring to the application as "my system" rather than "your system" by the time development is well under way, Coulter said. For that reason, the user should drive the process throughout the life of the development cycle.

Perhaps the most important commitment corporate management must make is in the area of personnel. "Accounting people tend to think all you have to do is push buttons and things happen in DP," he said. "It's hard to believe people think you can make a conversion without increasing the people commitment. Your management has to understand the resources you need to install or convert."

Coulter said that when he was at Home Box Office (HBO), a division of Time, Inc., the manager of accounting held weekly meetings to check on the progress of an accounts payable and general ledger installation effort.

"If we needed people, he made sure they were available," he said. In return, DP was expected to meet the accounting department's ambitious deadlines.

Both the user and the DP sides of the project management team must define their roles and stick to them without attempting to do the other department's job, Coulter said.

■ DP should develop the conversion plan, identifying interfaces from other financial systems and setting realistic time frames.

■ It should interact with the user decision-makers. "This is key," Coulter said. "It's very important to know who makes the decisions, who pays the tab and who expects results."

■ It is also up to DP to maintain a relationship with the software vendor that enables the user company to take advantage of the vendor's services when needed.

■ DP must install and test the software, making sure all documentation and instructions are present and that the software is installable.

■ DP must bring the system to operational status.

To make the last two steps easier, do some up-front planning, Coulter said. Set standards for job control language (JCL) and do not modify JCL at first. "You want to make sure the package is installable," he added. Retain identification codes for programs and job streams that are similar to those used by the vendor. That makes error tracking easier than if entirely different identifiers are used, he explained.

One should also bring the system into operation in line with the needs of the user, Coulter indicated. The user may want to build a history file by converting existing data or simply by starting fresh, he added. Building interfaces to existing systems and methods is important in order to bring data over that is in line with the user's expectations.

Coulter

Users, for their part, should be responsible for training their own people, according to Coulter. They should create their own report formats. At HBO, users hired two consultants strictly to build reports. Users will want to define their own control and security systems and should plan for conversions so that it coincides with the expectations of DP, he said.

In addition, users must be solely responsible for defining their own chart of accounts and relationships and for deciding how data should be captured and maintained, Coulter added. All these steps should be taken without extensive DP involvement. The user will not feel he owns the system unless he has defined in detail how it will work, he explained.

According to Coulter, the end result of coordination between DP and user departments is reduced personnel costs, which are by far the most expensive aspects of installation or conversion.

For anyone who has anything to do with the development of business software...

13 reasons why you should read this system-development book

1 **You'll learn practical...not theoretical...ways to develop business systems.**

No pie-in-the-sky ideas in this book...just proven methods that work. In fact, these methods are *guaranteed* to help you on the job...whether you're a manager, an analyst, or a programmer.

2 **You'll learn how to avoid creating paperwork that no one uses anyway.**

You'll stop wasting time on useless paperwork. Instead, you'll get right down to analysis and design decisions so you can get the system done faster.

3 **You'll learn how your work in one development phase simplifies the next.**

Some books focus just on analysis or design. But this book shows you how all the parts tie together. You'll see how your analysis makes the system easier to design ...how your design makes it easier to implement...and how your implementation makes it easier to maintain. You'll also see how you can overlap the phases to get the system running sooner.

4 **You'll focus on the big decisions that won't change...not on the details that will.**

You'll learn how to concentrate first on overall *functions* and put off the details until later. As a result, your analysis and design won't be destroyed when users mention details they forgot to tell you about.

5 **By following a complex business system through development, you'll learn what to look for...and look out for ...when you develop systems on your own.**

You'll see how to handle the tasks that are common to most businesses. But you'll also see how the special requirements of a business (in this case, a commodities brokerage) affect design and implementation...so you'll know how to provide for them in your own work.

6 **You'll learn how to make decisions, not how to draw charts.**

Some courses are based on drawing charts full of special boxes, circles, arrows...symbols that are tied to details and have to be changed each time a detail changes.

Now I know that graphics can be a big help in system development, and this book does teach a graphic approach. But the documents you'll create are easy to understand and change. And the emphasis is not on the drawings, but on making the decisions that are documented in the drawings.

7 **You'll learn how to boost programmer productivity.**

You'll find ways to make programs easier to code, test, and debug. More important, you'll learn to make the design decisions that boost productivity the most. For example, when you make the right decisions about file structure, you avoid the late changes...like adding a field or two...that lead to re-programming, re-compiling, and ulcers.

8 **You'll learn to document the system as you develop it.**

Not only will your documentation be accurate. But collecting it at the end of the project won't be the tedious task it has been in the past...so it'll be easier to do right.

9 **You'll learn how to create systems that users are happy with.**

The analysis and design documents you create are easy for users to review. So they'll be able to point out mistakes early in development, before the changes get expensive. And when there's a design choice, they'll be able to tell you which alternative makes the most sense to them. As a result, they'll find the finished system works the way they want it to...and they'll be eager to use it.

10 **You'll learn how to develop reliable systems that are easy to maintain.**

Another way to keep your users happy is to make sure the software works right every time. And you can do that using the methods in this book. You'll develop systems in a controlled way from start to finish, so you can test them completely. And the documentation and programming methods will make it easier to pinpoint and correct any bugs.

11 **You'll get plenty of ideas for interactive systems.**

These ideas include: how to create menus that tie into the system design...how to use menus to control security and time-dependent processing...13 tips for designing screens so they're easy to read and use...and more!

12 **You'll be the one to decide which ideas will work best for you.**

The methods in this book work...even if you're the only one in your shop who uses them...even if you only try some of them. So plug the ideas you like into your current development method and see what a difference they make.

13 **This book is guaranteed to work for you forever.**

You must be satisfied with it, or send it back for a full refund...*no time limit*.

1 more reason for trainers

1 **You'll save hours of work with our case studies and instructor's guide.**

Our case-study book gives you 4 problems based on actual businesses, the instructor's guide gives you complete solutions. Both are *guaranteed* to help you turn your trainees into first-rate system developers.

Planning keeps package running problem-free for years

CW AT SI USERS GROUP

By Paul Gillin
CW Staff

SAN DIEGO — Donald Willis has never had to grapple with the "make or buy" decision of application software during his 13 years at the Capital Group, Inc. in Los Angeles. Willis, who is manager of corporate accounting, joined the Capital Group in 1971 when the company was in the middle of the process of installing a general ledger package from Software International Corp. (SI).

Thirteen years and four major releases later, Willis is still an advocate of packaged software. The choice seemed natural for the Capital Group in 1971 as it entered a period of aggressive growth. The packaged solution offered faster installation than an in-house-developed system and greater flexibility than any alternative, he said in an interview at the 15th Software International Users Group Conference held here last week.

The Capital Group is an investment management and research company that owns several other subsidiaries worldwide. Subsidiaries include Capital Research and Management Co., Capital Management Services, Inc., Capital Guardian Trust Co. and international affiliates in Europe. An IBM 4381 computer at the company's Brea, Calif. headquarters processes virtually all corporate financial accounts. Individual customer accounts are maintained by a service bureau.

The packaged application has operated so smoothly that Willis said it ran virtually maintenance-free between 1972 and 1981, when the Capital Group converted from Version 3 to Version 4 of the general ledger package.

The secret lies in the fact that 13 years ago some very astute accountants did some very careful planning, he said. "If you think it out on the front end, [the package] should serve you for years and years," he said.

Unfortunately, a common problem of package installations that many DP departments must fight is the unwillingness of corporate management to acknowledge the difficulties involved. "Management often thinks of a package as if it [were] a lamp," he said. "You should be able to just plug it in and have it work."

The truth is quite the opposite, he said. Installing a software package does not offer much leeway for changes during development. As a result, the package has to be selected and implemented with an eye toward the long haul.

Estimate growth paths

A critical planning element is estimating growth paths, he said. If your company is planning to double in size over the next 10 years, you need a package that allows you to add many new relationships, and logic that will let you customise the software to handle the accounts the way your business handles them.

That effort can also pay off in case of installing new releases. The Capital Group has been able to bring up new versions of the general ledger over the years with few visible changes, he said. "In some cases the users don't even know the conversion has been made," he said. A key element is knowing the new release before trying to install it.

When implementing a new release, the Capital Group does not use the only copy of its live data. Production data is backed up prior to the change. Conversions should be made during the off-season or during holidays when work is likely to be slow, he said.

Steady contact with the vendor is critical both during conversion and in day-to-day operations, Willis said. "User conferences are one of the best ways I know to meet the vendor," he said.

Realia COBOL.
Migration without migraines.

Until recently, you had to abandon the business computer language when you developed microcomputer application software. The available micro COBOLs were inadequate—too limited, too slow. The best alternative—the XT/370 or AT/370 using IBM's COBOL—was very expensive and still too slow. To get acceptable performance, you had to retrain your programmers in Pascal or C.

Realia COBOL is the cure for such headaches.

Realia's compiler supports most IBM VS/COBOL and VS/COBOL II features, such as:

- COMP and COMP-3 data
- SELECT assignment names
- Multiple entry points
- GOBACK, EJECT, and SKIP statements
- Structured programming extensions of VS/COBOL II

You can download mainframe systems for development, maintenance, and testing. Productivity will soar.

You can compile faster with Realia COBOL than in most mainframe environments, even on floppy-based systems. Compile-time options allow cross-reference, brief and full code listings, and helpful features like subscript and decimal value checks.

Our interactive debugger lets you follow the program source, display and modify data, and set breakpoints using the normal optimized machine code.

The results are startling.

Our users report that their systems run up to 20 times faster when compiled by Realia COBOL. That's compared to our nearest micro competitor. The ratio is up to 100 times faster when compared to any of the others.

On the IBM PC AT, your programs can run at 370/148 to 370/158 speed. Realia's file system really makes your machine deliver, giving it a distinct edge over Pascal or C. Our indexed file system even has full key compression and buffer controls just like VSAM. The generated code is pure MS-DOS, so it can be run on most of the 8088/8086 machine family.

And you can sell your programs without paying us a royalty fee.

Realia COBOL is priced at $995, including one year of maintenance and upgrades. Subsequent maintenance and upgrade contracts are currently priced at $125/year/copy. Available for the IBM PC, PC XT, 3270 PC, PC AT, PC-compatibles, and the TANDY 2000.

Realia COBOL. What a relief.

IBM, IBM PC, PC XT, 3270 PC, XT/370, PC AT, and AT/370 are registered trademarks of International Business Machines Corporation. MS-DOS is a registered trademark of Microsoft Corporation.

Sperry launches 7000/40 32-bit superminicomputer

Machine supports up to 128 users, targeted to compete against DEC VAX-11 superminis

By Edward Warner
CW Staff

LAS VEGAS — Sperry Corp. last week chose the world's largest microcomputer show as a stage to unwrap a 32-bit superminicomputer supporting up to 128 users and designed to run AT&T's Unix operating system and the C language.

The Sperry 7000/40, announced at Comdex/Fall '84 here, will be manufactured by Computer Consoles, Inc. and will reportedly feature an AT&T Unix operating system and main memory capacity of between 4M and 8M bytes.

Priced between $160,000 and $900,000, depending on configuration, the 7000/40 will also reportedly offer independent processing for instruction decoding, address generation and instruction execution, allowing the system to process three instructions simultaneously. First shipments are slated to begin Feb. 2.

The 7000/40, Sperry officials said, is targeted to compete with, among others, the Digital Equipment Corp. VAX-11 superminis, including the recently introduced 8600 series.

"VAX users who are looking either to upgrade their system or standardize on a VAX Unix product can now have the option of migrating to the Sperry family," according to Dewaine Osman of Sperry's Americas Division.

Initially, the 7000/40 will support the University of California at Berkeley Unix 4.2 operating system, but Sperry's director of microsystems and commodities marketing, Neal Waddington, said that by mid-1985, AT&T's Unix System V will also be available.

The former operating systeh will make the machine attractive to the scientific market, while the latter — which provides IBM interconnect ability — will enhance its appeal to commercial users, Waddington observed. Berkeley Unix 4.2 for the 7000/40 will be priced from $10,000 to $22,500, depending on the number of users.

Other features of the 7000/40 are a separate subsystem for the CPU, main memory and I/O and four-way interleaving of its memory capacity, said to permit several controllers to access memory simultaneously.

Sperry Corp. can be reached through P.O. Box 500, Blue Bell, Pa. 19424.

Apple's Sculley: Innovation will shake micro doldrums

CW AT COMDEX/FALL '84

By Edward Warner
CW Staff

LAS VEGAS — Abandoned by investors and shaken by the shakeout, the personal computer industry is trapped in a giant rut that it can escape only through innovation, said Apple Computer, Inc. President John Sculley in his keynote address opening the Comdex/Fall '84 show here.

Sculley

That innovation, Sculley indicated, will come from the software world because the personal computer has "begun the transition from a hardware machine to a software appliance."

Contributing to the industry's rut, the Apple chief said, is the fact that the shakeout of microcomputer hardware makers has now expanded to include software publishers and makers of computer peripherals. To get the industry back on track, he added, innovation will be needed, and "innovation must be market-driven to be successful."

Sculley, who joined Apple a year and a half ago, also had some thoughts to share about innovation as it pertains to his firm's continuing battle with its Big Blue nemesis. When told shortly after his arrival that Apple should seek IBM compatibility or a non-IBM dominated market niche, Sculley said he responded, "I get my satisfaction from being a dreamer, a builder and a leader."

He later remarked that IBM compatibility will become harder and harder to achieve, citing as evidence the arrival of the IBM Personal Computer AT and the announcement of IBM's upcoming Topview windowing environment.

Sculley argued, however, that size is not enough to ensure success, pointing to the minicomputer makers and AT&T, which he said are not providing the leadership needed in the industry.

While not mentioning his firm by name, he said the leaders of the personal computer industry "will not resort to mass merchandising, but will work with their dealers as partners."

In his speech, Sculley blasted the venture capital investment community, which he said "has turned away from the biggest growth industry."

SPERRY

from page 1

access memory and a 10M-byte hard-disk storage unit and will cost $395.

Also introduced were versions of Unix for the Series 5000 supermicros and the firm's new Series 7000/40 superminicomputers (see story above).

Until now, "You haven't seen a mainframe-to-micro company making such a financial commitment to Unix," claimed Dewaine Osman of Sperry's Americas Division.

Four models offered

The Series 5000 supermicros, meanwhile, will be offered in four models, reportedly supporting from eight to 64 users and offering processing at a rate ranging from .7 millions to 3.2 millions of instructions per second.

The machines, based on the Motorola, Inc. 68000 CPU, will reportedly offer dual bus design and a separate processor/memory technique that provides error checking and correction.

Series 5000 supermicros will be priced from $15,000 to $50,000 for the low-end 5000/20 and 5000/40 models and from $62,000 to $150,000 for the high-end Models 5000/60 and 5000/80. Shipments of Models 5000/20 and 5000/40, being manufactured for Sperry by NCR Corp. and two other firms, will reportedly begin at the end of January 1985, while shipments of the Models 5000/60 and 5000/80, being manufactured by Arete Systems Corp., are not scheduled to begin until March 8, 1985.

Unix System V for the Series 5000 machines will be priced from $1,250 to $22,500, depending on the number of users.

Sperry's Series 5000 announcement was accompanied by the unveiling of office automation and factory automation software packages for the line.

The integrated office automation package, Q Office, is said to offer word processing, spreadsheet capabilities, data base manipulation and graphics. It is priced from $3,500, for the 5000/20, to $20,000, for the 5000/80 64-user system.

Sperry's Manufacturing Business Solution (MBS) factory automation package runs under Unix on both the Series 5000 and on the 7000/40 supermini.

MBS is said to be an on-line MRP-II manufacturing control system with integrated financial applications, including transaction history, actual-cost to standard-cost variance reporting, year-end material and financial rollover functions and password security.

Terminals announced

Also announced at its Comdex press conference were two terminals that the firm said would be most appropriate in a Unix environment — the SVT 1210 and SVT 1220. The SVT 1210, priced at $696, reportedly provides green-screen display and Digital Equipment Corp. VT52 and VT100 terminal emulation. The SVT 1220, priced at $796, reportedly emulates the DEC VT220.

Citing one projection that estimated sales in excess of [illegible] million Unix systems by 1988, Sperry's Osman said his firm "is positioned exceptionally well to take advantage of this Unix growth potential" and that such emphasis would help the firm move away from relying on its mainframe line as its primary source of revenue.

Sperry can be reached through P.O. Box 500, Blue Bell, Pa. 19424.

Save a programmer.

Right now, every one of your programmers may be a serious candidate for "programmer burnout."

That's because without realizing it, they spend much of their time rewriting existing source code — a tedious task for them, and a major productivity drain for you.

MANAGER SOFTWARE PRODUCTS' SOURCEMANAGER™ frees your programmers from this task and lets them get on with the challenge and pleasure of writing procedural code. Which of [illegible]

SOURCEMANAGER is an on-line, dictionary-driven, COBOL applications development system. It automatically generates standardized data definitions and program documentary sections. It helps programmers develop a library of re-usable code — and helps them develop procedural code. It even detects standards and style violations, and provides efficiency controls.

SOURCEMANAGER performs brilliantly as a stand-alone system. Yet it can be fully integrated with other dictionary-driven products in MSP's MANAGER family — such as DATAMANAGER®, the data and information resource management system, and DESIGNMANAGER™, the logical data base design and modeling system.

Find out how SOURCEMANAGER can help you prevent programmer burnout and increase productivity. Send the coupon today. Or call (617) 863-5800 (Telex 710 326 6431).

Managers go to Comdex for micro news

CW AT COMDEX/FALL '84

By Kathleen Sullivan
CW West Coast Bureau

LAS VEGAS — For microcomputer managers, the Comdex/Fall '84 conference, held here last week, represented the opportunity to stay a step ahead of the continuing explosion of technology and products in the personal computer industry.

"Generally, we're here because we're trying to stay a little bit ahead of the curve," said Roger G. Neaves, vice-president and general manager of data center planning for San Francisco-based Wells Fargo Bank. Neaves was one of several micro managers interviewed by *Computerworld* at the start of the show.

"We are trying to avoid getting buried," Neaves added. Neaves said he and Raymond E. Potts, who serves as his assistant in the data center planning division, planned to walk through the entire show, which this year included 1,400 exhibitors spread out among six major facilities.

"If anything catches our eye, we'll stop and look at it," Neaves said. Neaves and Potts, who oversee the purchase of computer equipment for Wells Fargo — from personal computers to mainframe systems — said Comdex gives them the chance to accomplish several tasks at once.

The two planned to check out new products at the request of their end users who had asked about software programs that had been announced. Neaves, who pointed out that some companies in the personal computer industry have had problems delivering a product after announcing it, said Comdex would give him the chance to confirm whether new products "were alive and well" or were simply "vaporware."

In addition, Neaves and Potts said they would be investigating current offerings in the local-area net market for Wells Fargo, which has installed close to 900 personal computers in its offices throughout California.

For large organizations that have made a commitment to personal computers, local-area networks represent the "obvious next step" in making the machines more productive and more useful, Neaves said.

Neaves and Potts cited other interests as well, saying they would be looking for dumb terminals to hook up to IBM's recently announced Personal Computer AT, as well as multifunction boards for the machine.

In addition, the two said, they are now wrestling with the issue of data security and would be paying attention to exhibitors who offered products in that market.

Steven Hochberg, vice-president of Complete Technology Corp., a Flint, Mich.-based firm that acts as a microcomputer consultant to Fortune 1,000 firms, said Comdex would give him the chance to stay "one step ahead of users."

While most users help micro managers decide which products will be used within an organization, the microcomputer manager must stay on top of the changing technology, new products and new buzzwords, Hochberg explained.

Hochberg, who said Complete Technology has installed approximately 60 personal computers in its own offices, said he would be looking at a variety of products at Comdex, including printers, micro-to-mainframe link packages and project management software.

Unlike Neaves and Potts, Hochberg said he would not be focusing on developments in the network market while attending Comdex. Although Hochberg said he was interested in the technology, he did not expect any significant announcements in local-area nets at this year's show.

Hochberg said most of his firm's users were satisfied with their basic applications software packages, so he would not be looking at new programs. Instead, he said, he was interested in software productivity tools, such as Topview, IBM's recently announced operating environment.

"Management is crying out for some type of system where users can get on a computer and hunt and peck their way through several software packages under their own menu system," he said.

Hochberg said he planned to take a look at Topview, which is said to provide a windowing and multitasking environment for applications software.

COMDEX

from page 1

software offerings and dozens of personal computer and multiuser micro system debuts. It also placed a considerable emphasis on communications links.

Among major Comdex developments, Sperry Corp.'s Information Systems Group unveiled plans to put AT&T's Unix on a broad line of products (see story page 1). Texas Instruments, Inc.'s Pro-Lite laptop computer (see story page 57) and Lotus Development Corp.'s Jazz software for the Apple Computer, Inc. Macintosh (see story page 6), also gathered crowds.

In other software moves, Ashton-Tate introduced upgrades of its Framework, Dbase II and Dbase III application programs that are fully supported by the IBM Personal Computer AT. Updates for current licensees range from $25 to $35 (depending on shipping costs), except for licensees of Dbase II version 2.3 and earlier, who will be charged from $75 to $90. Ashton-Tate is located at 10150 W. Jefferson Blvd., Culver City, Calif. 90230.

Microsoft Corp. showed two new applications for the Macintosh, the Microsoft File data management package and the Microsoft Word word processing program. Each will be available by the year's end and will cost $195. Microsoft is headquartered at 10700 Northup Way, Bellevue, Wash. 98009.

Apple itself introduced a 10M-byte hard disk drive for its Lisa, Apple II and Apple III. The Profile system will be available this month for $1,995. Apple is located at 20525 Mariani Ave., Cupertino, Calif. 95014.

Third-party developers also showered the Macintosh with hardware and software products, including a hardware accessory kit that hooks the system to the NEC Information Systems, Inc. Spinwriter letter-quality printer. The kit costs $100 and is available from NEC at 1414 Massachusetts Ave., Boxboro, Mass. 01719.

In networking, the first diskless workstation from a leading vendor of IBM Personal Computer-compatible systems appeared. The diskless version of the Zenith Data Systems Corp. Z-150 is shipping now with a $1,599 price tag, according to Zenith, which is based at 1000 Milwaukee Ave. in Glenview, Ill. 60025.

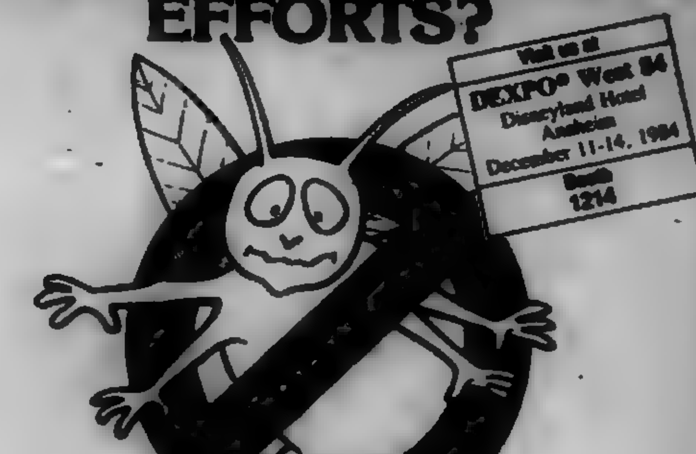
The show also featured many recent network offerings, including enhancements of 3Com Corp.'s Etherseries software. Etherseries 2.4 products reportedly support the Personal Computer AT and provide a new menu system that boosts security and enables users to custom-design application menus. 3Com also cut prices on software and hardware products from 18% to 70%. 3Com is located at 1365 Shorebird Road, Mountain View, Calif. 94039.

Many multiuser microcomputers running some version of Unix were introduced at Comdex/Fall, along with several other multiuser systems designed to connect to personal computers. In the second category, Televideo Systems, Inc. showed the PM/16T, an enhanced version of its Personal Mini/16 that adds an integral 20M-byte streaming tape drive, 512K bytes of random-access memory, a multiuser version of the vendor's Infoshare operating system and an electronic mail package. The PM/16T will be available in February for $9,996, according to Televideo, which can be reached at 550 E. Brokaw Road, San Jose, Calif. 95112.

Among the host of add-on products for the Personal Computer AT appearing at Comdex, Sysgen, Inc. displayed a 45M-byte cartridge tape backup subsystem. The Qic-File subsystem costs $1,395 for an internal version and $1,495 for an external model, according to Sysgen, which is headquartered at 47853 Warm Springs Blvd., Fremont, Calif. 94539.

Comdex also produced several 2,400 bit/sec modems targeted for personal computers. One leading contender is the Hayes Microcomputer Products, Inc. Smartmodem 2400, which is said to provide intelligent transmission controls, voice/data switching and the ability to set communications instructions with keyboard commands. The modem is available for $899 from Hayes, which is located at 5923 Peachtree Industrial Blvd., Norcross, Ga. 30092.

ARE BUGS PLAGUING YOUR PROGRAMMING EFFORTS?



RXVP80™ IS A BUGBUSTER

RXVP80 finds bugs in your FORTRAN programs before you do!

It also documents your programs for you and tells you what parts of your programs aren't executed when they run. All this in terms of your source code. RXVP80 is as easy to use as your compiler and is available on most superminis and mainframes including DEC VAX and IBM equipment.

RXVP80 has an established track record for increased productivity, quality error-free software, on-time software deliverables, and decreased maintenance costs for large and small companies around the world.

Coalition needed to stem computer crime

CW AT COMPUTER SECURITY CONFERENCE

By John Gallant
CW Staff

ROSEMONT, Ill. — Only a concerned coalition of government, industry, users and consumers can stem the tidal wave of computer crime that threatens to engulf the U.S., according to the head of one of the nation's largest public data networks.

J. David Hann, president of GTE Telenet Communications Corp. told visitors at last week's 11th Annual Computer Security Conference here that the responsibility for halting the growing danger of computer crime and computer security violations is a shared one.

Hann said the task of stopping the computer crime wave must be taken up not only by legislators and industry officials, but also by all computer users and "every consumer whose tax and credit records — even medical records — are kept in computers."

"Over the past year and a half," Hann said, "we have seen a lot of media hype and stridency on the part of public lawmakers concerning computer security. But this already enormous problem is still growing. What can we do to stem the computer crime wave?" he asked.

"I believe the problem is solvable," he continued. "I am very optimistic about our future progress in stopping computer crime. A solution is within reach — a solution based on a new level of commitment and cooperation that is growing today. Industry must band together with users and government to find an effective and just solution to the problem of computer crime."

Hann said the current generation of computer criminals — so-called hackers — has been portrayed as bright, adventurous "kids" who utilize public networks to illegally access unguarded systems. But he warned of a far more serious security issue, the rise of a sinister class of criminals who use computers to perpetrate their crimes.

According to Hann's statistics, an armed robbery, on the average, nets the criminal $3,000, and the average embezzlement yields between $19,000 and $25,000. But the average computer crime earns the perpetrator a staggering $100,000 to $500,000, he said.

Hann quoted a June 1984 report released by the American Bar Association's Task Force on Computer Crime [CW, June 18], which showed that fully one quarter of the nation's largest corporations reported verifiable losses due to computer crime. The total value of those losses was reported to be between $145 million and $730 million, which represents an average loss of $2 million to $10 million per respondee.

Billions of dollars lost annually

"If we take this as a representative sampling of other businesses and government," Hann said, "computer theft and abuse costs North American businesses billions of dollars annually."

And, according to Hann, the hackers who pester public networks add to that costly toll — even if they do nothing more than illegally access computer systems. "An alert, determined operations staff is needed to find the very small clues left behind by professional criminals. But the crowds of hackers provide a steady distraction." The youthful hackers prove to be such a distraction, Hann said, that the attention of the operations staff is diverted from tracking down the professional criminals. "So the whiz kids are contributing to the proliferation of serious crime and abuse. Computer trespassing is not child's play even if no harm is done," he said.

GTE Telenet's own Telenet communications network was used by hackers in August 1983 to break into computers in the Nuclear Research Facility at the National Laboratory in Los Alamos, N.M. [CW, Aug. 22, 1983].

What is Hann's system for ensuring computer security in a public data network environment? First, consumers, computer owners, public network operators and government officials must work together to promote legislation that matches penalties to the seriousness of the crimes. In addition, industry officials must take a firm stand on pressing charges against suspected offenders.

As a third step, Hann said public network operators should begin to educate customers on potential security risks and on methods for improving the integrity of their systems. Finally, those operators must enhance the security of the networks by providing security products and services to their customers.

Computer crime bill inadequate

What has GTE Telenet done along those lines? "We have pressed for strong legislation, and we have worked with the [House of Representatives] to draft such a law," Hann said. "The bill that was finally passed this year [CW, Oct. 15], is not adequate to cover the full problem, and it should be reviewed and strengthened in the next legislative session," he added.

Hann said GTE Telenet had also contacted the governors of all 50 states to promote stronger state legislation and has practiced a policy of cooperating with law enforcement officials to prosecute violators. He said the firm has been successful to date in obtaining both indictments and guilty pleas under federal wire fraud statutes.

In addition, he said, GTE Telenet has worked to provide customers with new security products and services, such as public key encryption methods for electronic mail and personal identification number systems to prevent unauthorized access.

Equitable workers win VDT safety clause in contract

SYRACUSE, N.Y. — Clerical workers at a major insurance company here agreed to a labor contract earlier this month that included groundbreaking provisions involving VDT health and safety.

A spokeswoman for District 925 of the Service Employees International Union of the AFL-CIO, said the agreement with the Equitable Life Assurance Society of the U.S. could serve as a future model for protecting employees who work with VDTs.

"What's important here is the breadth of concerns covered in the contract," said Karen Nussbaum, president of District 925 and head of 9-to-5, the National Association of Working Women.

The agreement covers 54 members of District 925 — insurance claims processors and support personnel — who work at Equitable's group benefits office here. Nussbaum said the contract is especially significant in that it involves a private company in an industry that has been difficult to unionize.

Provisions of agreement

The accord includes provisions for installation of glare reduction devices, adjustable chairs, detachable keyboards and regular machine maintenance.

The contract provides for extra work breaks away from VDTs, and it also gives female workers the right to ask for transfers to non-VDT work during pregnancy.

Gilbert M. Reich, an Equitable vice-president, said the company "is pleased that the terms of the agreement fall within the framework of our long-term business plans."

Workers and unions have long been seeking protections related to health and safety issues involving VDT use. Various scientific studies have provided inconclusive and sometimes contradictory evidence about the hazards posed by VDTs.

Threats to systems outpacing security technology

CW AT COMPUTER SECURITY CONFERENCE

By John Gallant
CW Staff

ROSEMONT, Ill. — While they give security products vendors an "A" for effort, most visitors to last week's 11th Annual Computer Security Conference here said they don't think security technology is keeping pace with the threats to computer systems.

In a random survey conducted on the exhibition floor attendees told *Computerworld* that they were encouraged by the awakening of interest and the growing level of research and development demonstrated by vendors. Security personnel interviewed expressed considerable interest in the increasingly sophisticated access-control and data encryption devices and microcomputer security products only now becoming available.

But those same executives lamented the lack of a comprehensive approach to security — one product or vendor that handles all aspects of a company's security requirements — and the narrowly focused, task-specific nature of many of the products demonstrated here.

"It is very clear that the technology is not keeping pace. We haven't even quantified the threats yet. The risk possibilities have not been explored fully," David Moore said. Moore is second vice-president of Jefferson-Pilot Information Services, Inc., located in Greensboro, N.C.

Risks in data communications

According to Moore, the real security issues do not involve in-house, hard-wired systems, but the increasing risks involved in data communications. "Outside communications concerns me," he said. "We have a responsibility to our customers to protect their information. Some of the products here are years ahead of any need we might have, but none solves all our problems."

Alfred Foster, data security administrator with Englewood, Colo.-based U.S. West, also applauded vendor efforts. "They are making a very good attempt to meet our needs. The increase in R&D in security in the past year is phenomenal. Suddenly, everyone is interested in security it seems."

Foster said the greatest worry he faces with U.S. West, one of the holding companies created by the breakup of the Bell system, is authorized users remotely accessing corporate information. "Once that data is outside the mainframe," he said, "you have lost all control over it. There is really nothing you can do except try to maintain accurate audit trails. As far as I know, there are no products available today that address that concern."

With between 400 and 600 mainframe terminals under his security control, John Schneider complained about the limited scope of the security products available. "The kind of security I am looking for transcends the equipment I have seen here," said Schneider, who is security control administrator for ITT Communication and Information Services, Inc. in Secaucus, N.J. "Some of these systems require you to have one access control box per terminal. I do not need something like that. I want one box that can handle all our terminals. Otherwise, it just is not cost-effective."

Philip Suitkey, assistant vice-president of the Cedar Rapids, Iowa-based Banks of Iowa Computer Services, said he would like to see advances in text encryption technology.

"The variety of products today is incredible compared [with] just a couple of years ago," he said. "I am responsible for security within my organization. We have physical security devices and access controls in place, but we need more in the way of encryption. The way that communications is growing, including the use of satellites, that is vital."

Though he believes the technology is just now starting to catch up with the threats to computer systems, Michael McNamee said that something more than products is needed to ensure the integrity of information. "Users must be made aware of the threats to security," he said. "The information they are using and distributing is valuable, and they just do not realize the importance of integrity."

"I would like to see better education on security in our colleges," said McNamee, who is information asset security administrator with IBM in Westchester, N.Y. "I would like to see a curriculum for data security professionals. My background is in finance, and I only got into this field in my role as an auditor."

But in the end, according to Robyn Strang, the race between technology and threats may prove to be a vicious cycle. Strang is security officer with Menlo Park, Calif.-based Saga Corp. "I think we are making some advances, but someone will always counter them. Some of the products seem incredibly advanced, but it is only a matter of time before someone catches up to them. No matter what controls you develop, someone will always find a vulnerability."

The Digital VT220 is in stock at Continental. Before you settle for an emulator, consider the total cost.

Why settle for a seemingly less expensive emulator and risk higher maintenance costs when you can have the **real thing** with on-site maintenance for as little as $9/month? That's right, with **Digital's VT220™** you get it all—top performance, reliability, and an unbeatable service package. True, you might be able to find an emulator for less, but you could easily spend the initial "savings" in maintenance fees alone.

Even today, selecting an advanced video terminal is really quite simple. Doesn't it make sense to select the **industry standard VT220** instead of a mere imitation? Order your VT220 from Continental today and take the guesswork out of terminal selection. We guarantee immediate availability so you can have your VT220 up and running in just a matter of days.

We deliver what you need.

* VT220 is a trademark of Digital Equipment Corporation.

Safeguarding security plan integral to overall strategy

CW AT COMPUTER SECURITY CONFERENCE

By John Gallant
CW Staff

ROSEMONT, Ill. — There are many different kinds of security. There is the security of being surrounded by loving family and friends. There is the security that comes from knowing you have enough life insurance. There is also data and computer systems security.

And then there is the security of security.

Redundant? Donn Parker doesn't think so. Important? Probably more than you can imagine, according to Parker.

Parker is a senior management systems consultant with Menlo Park, Calif.-based SRI International, Inc. and an expert in computer systems security. The author of three books on computer crime, Parker is also currently directing a computer abuse research project funded by the National Science Foundation.

Last week, at the 11th Annual Computer Security Conference here, he related to attendees the vital importance of protecting and safeguarding information about their security systems and practices. "An organization's security information about controls, practices, vulnerabilities and plans is the most sensitive of all," Parker said, "because it is the key to unlocking all other information. Secure security practices are needed. I may sound a bit paranoid, but you would do well to listen."

According to Parker, the security of security is plagued by two major classes of problems. The so-called active problems involve the voluntary, though perhaps not intentional, disclosure of secrets. The active problems include casual meetings and conversations in which a security administrator may unwittingly reveal his firm's security secrets — what Parker labeled a "loose lips sink ships" situation.

In addition, third-party questionnaires and inquiries as well as vendor and outsider visits pose the potential for active disclosure. And, while they are touted as one approach to designing companywide security systems, in-house task forces often present another threat of overly wide security data dissemination. Parker also listed among the active problems in-house publications, training programs and overly informative terminal prompts to users who have not even logged on.

"I am amazed at the amount of information you will tell a total stranger at a conference like this," Parker said. "You will willingly reveal your security mechanisms, your safeguards — even your weaknesses. You are giving away the keys to the kingdom."

The second class of problems is what Parker labeled passive ones, involving involuntary disclosure of systems and practices. Among these are theft of security information, industrial espionage, the loss of such data and "spoofing," in which an unauthorized person poses as a legitimate insider to gain knowledge.

Parker outlined a number of steps an organization can take to offset both the active and passive threats to the security of security.

■ First, a company must establish strict security policies and provide notice of them to every employee.

■ A company must also promulgate a code of security conduct that establishes rewards for compliance and penalties for violations, such as disclosing a password.

■ Firms should obtain confidentiality agreements with all vendors and consultants and provide for safe practices for the hiring and firing of all personnel, especially security employees.

■ Parker urged corporations to avoid detailed disclosures of security data and to minimize screen prompts to prospective system users.

■ Finally, he warned security personnel to keep them secret.

Parker urged the careful control and discarding of security documents and the undertaking of an in-depth inventory of such information. In addition, he warned security administrators and all other executives to travel safely, carefully securing company information in their personal possession.

"Assume the enemy knows what you are doing, but keep everything as secret as possible. Employ the military's need-to-know concept for all security information. With everything you say, consider that your listener may be your worst enemy. The job you save may be your own," Parker said.

FBI head urges preventive action to protect sensitive data

By John Gallant
CW Staff

ROSEMONT, Ill. — In rapidly evolving industries such as the computer field, both law enforcement agencies and the private sector must work to keep abreast of potential problems, or the "twisted mind" will get ahead, the director of the Federal Bureau of Investigation said last week.

Speaking at the 11th Annual Computer Security Conference here, Judge William H. Webster assessed the "big three" problems — technology transfer, industrial espionage and computer-related crime — that he said threaten both corporate and national security today. Webster also outlined the steps the FBI has taken internally to beef up the security of its own computer systems.

Webster said the responsibility for countering the transfer of vital military and industrial technology rests squarely with his agency, assisted by the departments of State and Commerce and the U.S. Customs Service. He said that since the 1930s the Soviet Union has spent vast sums of money and manpower in an attempt to acquire such technology.

Webster said that in the past year there has been a spate of cases involving classified documents and other data being turned over to foreign intelligence officers and agents. Those cases have involved all types of people, Webster said, even an FBI agent arrested for allegedly supplying secrets to two Soviet agents.

"Our goal in foreign counterintelligence work is to identify and neutralize foreign intelligence operations, not just to arrest and prosecute the individuals involved," Webster said.

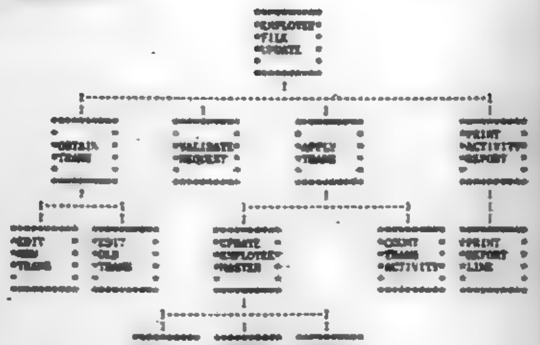
After touching only briefly on industrial espionage, Webster said that the investigation of computer-related crime has become an important facet of the agency's white-collar crime program.

He said that the FBI has begun to track crimes that fit the agency's definition of computer-related crime. He estimated the average dollar loss as around $500,000 per incident. Webster said it does not require genius to perpetrate a computer crime, only know-how.

"Since the investigation of computer-related crime is relatively new," Webster said, "we have had to develop new training methods. Since 1976 we have trained more than 300 agents and other law enforcement officials through our Computer-Related Crime school. It provides the basic skills needed to unravel the tangled trail of computer crime."

Webster said the agency had improved its own internal computer security by eliminating dependence on leased communications lines through the use of only dedicated lines, relying on transmission of only encrypted data, using access control devices and security software, employing the technique of periodic password changes and following strict policies for the acquisition and training of employees.

Webster characterized the federal computer crime legislation passed this year [CW, Oct. 15] as a beginning and said it would bring a measure of consistency to the state legislation in place or under consideration.



DISCOVERING HIERARCHY CHARTS?

H-Chart has been producing them for years. Since 1979, to be exact. But have no fear. You're just in time for the successor to H-Chart. Son of H-Chart, that is, H-Chart II, is now available from NDS.

In addition to producing hierarchy charts from COBOL source code, H-Chart II helps programmers (and managers) track those nasty GOTOs. And should a programmer slip up, (heaven forbid), the diagnostic report locates any non-executable code and even pinpoints and spotlights fall-thru code.

Curious?

Computer leasing expands, lessors optimistic

Financing, mart niches viewed as key factors in current leasing boom

INDUSTRY SPOTLIGHT

By Peter Bartolik
CW Staff

Coming out of the national recession two years ago, the computer leasing industry was troubled with uncertainty over the impact of IBM's leap into the third-party computer financing industry. Today business is booming, seemingly for everybody, and the industry is attracting new players; but nobody in the business is breathing any easier.

"There has always been a pall over the third-party leasing business, especially in the computer area," said Kenneth Pontikes, chairman of Comdisco, Inc., in an interview earlier this year. The industry, according to Jon J. Prager, chairman of Finalco Group, Inc: "has been through its ups and downs."

The industry right now is undoubtedly going through an up cycle. Market research firm International Data Corp. of Framingham, Mass., recently projected that the computer-related leasing industry as a whole will grow to revenues of $7.6 billion this year, a 30% increase over 1983 — about double the growth rate of the computer industry in general — and will grow 30% each year through 1987. IDC's figures include the market for used computer equipment, an area intertwined with leasing.

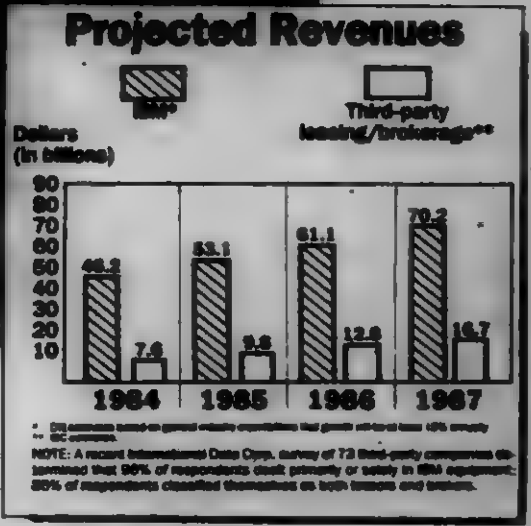
During the October meeting of the Computer Dealers and Lessors Association (CDLA), which numbers more than 200 companies as members, outgoing CDLA President Richard A. Forsythe, head of Chicago-based Forsythe/McArthur Associates, Inc., noted that "40% of the attendees [at the meeting] were not members two years ago. There is a lot of growth in this area."

In a recent IDC survey of 73 third-party leasing companies, 91% of the respondents rated business this year as good or excellent, and 94% said next year will be good or excellent. Despite that optimism, 62% of the respondents said they need to be more creative in order to stay competitive, and 41% said they need to diversify.

One does not have to look far to understand why today's optimism is tinged with caution about the future. IBM Credit Corp., the leasing subsidiary of IBM, has mushroomed into one of the largest companies in the business; IDC pegs IBM Credit as the leader in the field, putting $100 million of equipment out on lease each month through the first half of the year; others still give that distinction to Comdisco, with IBM Credit coming on strong in second place.

Formed in mid-1981, IBM Credit is now in high gear, estimated by IDC to be increasing its lease values by 92% this year and 50% next year.

The impact of IBM Credit on the third-party industry is a subject of debate within the industry. Some, like Comdisco's Pontikes, assert that IBM has legitimized an industry that has suffered from more than its fair share of scandals and IBM has thereby increased the size of the potential market; others, like Finalco's Prager, say IBM Credit has substantially limited growth opportunities in the IBM CPU and peripherals market (see story page 22). Even less clear is the impact that IBM Credit will have on the used computer market. The used market and the leasing market are inextricably tied together and, at some point, the equipment IBM Credit has put out on lease will begin to enter the used equipment market (see story page 23). Although there are many used equipment dealers not involved in leases, companies involved in leases are always involved in used equipment.



CW CHART

* [illegible]
** IDC estimate.
NOTE: A recent International Data Corp. survey of 73 third-party companies determined that 96% of respondents dealt primarily or solely in IBM equipment; 80% of respondents classified themselves as both lessors and brokers.

IBM is not the only computer manufacturer with a captive credit corporation; most of the large vendors have such subsidiaries or allied ventures formed with existing financing companies. The latest to jump into the fray is AT&T Credit Corp., which hopes to do for telecommunications equipment what the third-party market did for computer equipment. According to Charles Greco, director of financial services at IDC, "AT&T is trying to do in one year what it took IBM 20 years to do."

The leasing of telecommunications equipment, spurred by the deregulation of AT&T's equipment resources, is seen by many in the leasing industry as a potentially explosive new market. Edward Cherney, president of CMI Corp., is working with AT&T to develop distribution channels for used AT&T equipment, and he said that the key to success in that area lies in AT&T's commitment to make used telecommunications equipment a commodity in the same manner that IBM equipment has evolved. Cherney said AT&T has made that commitment through a willingness to provide maintenance of used equipment. AT&T Credit, while focusing initially on telecommunications gear, has made it clear it also intends to function in the computer market.

Finalco's Prager noted that "competition has been a way of life for us," and he expects to see IBM's and AT&T's credit subsidiaries, along with

INDUSTRY SPOTLIGHT

In recent years IBM has taken aggressive steps to eliminate rental and leasing of its equipment. Realizing that many customers still do not want to purchase equipment, however, IBM established a subsidiary to provide that rental option while still recording the equipment on its own books as an outright sale.

From its start three years ago as a five-man operation, IBM Credit Corp. has grown to replace Comdisco, Inc. as the premier leasing company in terms of volume, according to Charles Greco, manager of financial services with market research firm International Data Corp. (IDC) of Framingham, Mass.

IDC estimates that IBM Credit was writing leases in the first half of this year at the rate of $100 million worth each month, and because the second half of the year is traditionally busiest, IBM is estimated to achieve $1.7 billion by the end of the year. "IBM Credit Corp. will win any deal it wants to win," Greco declared.

James Benton, executive director of the Computer Dealers and Lessors Association (CDLA), an industry group composed of more than 220 third-party companies, conceded that IBM Credit Corp. will likely displace Comdisco as the No. 1 lessor by the end of the year, but argued that IBM does not want all of the third-party business. Third-party companies collectively have historically been IBM's biggest customer.

"The reason for IBM Credit's existence is that IBM wanted to get out of the leasing business and needed cash flow. But IBM was not going to give all of that business to the third-party companies," Benton said. With some 2,000 salesmen employed by CDLA members primarily in the business of leasing IBM equipment, he added, "We're an integral part of [IBM's] marketing strategy."

Kenneth N. Pontikes, chairman, president and founder of Comdisco, went as far as to question IBM Credit's viability in the area of financing leases. "If you look at IBM Credit in competition with the third-party industry, can they make the kinds of returns in that business that the rest of their businesses have the opportunity of making? No, they can't," he declared, predicting that IBM Credit will shift away from the financing of leases.

Pontikes and Benton both argued that the third-party industry is growing at twice the annual rate of growth of DP equipment sales; the third-party market is expected to grow as much as 34% this year to between $7 billion and $8 billion. "It's almost as if there is a realization that these [third-party] services are required as well as the additional hardware and the financing. I think that bodes very well for the industry as a whole," Pontikes said.

Jon J. Prager, chairman and chief executive officer of Finalco Group, Inc., readily conceded that the impact of IBM Credit's growth has "substantially limited growth for companies like Finalco over the next couple of years."

But Prager noted that competition has always been fierce in the leasing area and his company has prevailed "while big institutions have come and gone."

Greco believes IBM's subsidiary will attempt to duplicate the growth patterns of the other segments of its parent's business, and he argued that third-party companies must become more flexible in structuring their leases and will have to diversify into other areas such as communications equipment and software leasing.

Indeed, the larger companies appear to be making efforts to enter other market areas. Comdisco is marketing a disaster recovery service and has established a risk arbitrage subsidiary, among others; Finalco, which used to lease only DP equipment, in fiscal year 1984 wrote 53% of its leasing volume in non-DP equipment, including aircraft, telecommunications equipment, computer-aided design and manufacturing equipment and other types.

The leasing companies are also shying away from a dependence on leasing CPUs, a reliance that caused the collapse of Itel Corp., and are instead devoting more resources to peripheral equipment, which has a longer life span and greater residual values. Finalco, for instance, reported that in the fiscal year ended in July, mainframe leases represented only 5% of its total leasing volume.

them of other vendors and financial institutions, competing in many areas with the independent companies.

The growth in the leasing industry is so great and expected to continue over a long term, that one of the greatest concerns facing the industry, according to Forsythe, is "how to finance that growth." He said the industry could grow to $20 billion by 1990, based on current projections, and outside financing is a key to growth of third-party companies that cannot afford to tie up their assets in leases.

The fastest growing source of outside financing has also been the most controversial. There are many types of leases and many labels, but one type that has generated great profits and great problems is that known as tax-advantaged. A simplified explanation of this lease is that the leasing company, in exchange for various tax benefits and a portion of resale values, obtains the financing for equipment from outside investors, and the leasing company administers the lease for those investors.

A key to this type of lease is the tax shelter it provides to the investors, who see practically no profits from the actual lease until after the lease expires and the equipment is resold. It serves to provide users with relatively low-cost equipment; leasing companies can avoid tying up their own cash in leases; and investors gain short-term tax write-offs and long-term profits. Everybody is happy except for the IRS, which is currently on a crusade to halt all tax shelters that it deems are created merely for the purpose of sheltering income.

James F. Benton, executive director of the CDLA, concedes that the IRS does not appear to be singling out the computer leasing industry, but in fact is going after many industries involved in shelters. Nevertheless, he added, the scrutiny of what he calls "essentially plain vanilla wrap leases," along with a negative business journal article last year critiquing Comdisco's financial practices, has served to deter a number of leasing companies from going public.

According to IDC's Greco, the key for the future of the third-party industry, buffeted on one side by IBM and on the other by ever-changing tax laws, lies in its ability to remain flexible and to diversify. "Third-party companies have to continue to look for creativity; they must become more flexible in structuring their leases in order to compete with IBM Credit," he said. The independent companies must also quickly move into new areas where IBM and others have yet to focus, he added.

For smaller companies, the key to long-term growth may not be new markets, but rather identifying existing markets niches that are overlooked or neglected by IBM Credit and the bigger independent firms.

According to Robert Miller, chief executive officer of Minneapolis-based Centron DPL, "nichemanship" is the key to success. Relatively small, with revenues last year of $16.6 million, Centron DPL has focused primarily on leasing IBM front-end controllers, products that have a long product life compared to CPUs.

Robert Irish, vice-president of technical sales with Centron DPL, put the company's relationship with IBM in perspective: "Sometimes you're the good guy and sometimes you're the bad guy; and sometimes you're tolerated."

DJC
Recommends Racal-Vadic Modems

When it comes to communications, Racal-Vadic is a leader.

Racal-Vadic's complete line of modems, acoustic couplers and accessories comprehensively addresses the broad range of low- and medium-speed communications requirements.

DJC stocks all of Racal-Vadic's communications products, including the RV3451 triple modem, the Auto-Dial VA212 and the VA212LC, and the new Maxwell line of modems, specifically designed for personal computers. Availability in both 300 and 1200 baud and internal and stand alone models, the Maxwell is fully featured to fill all your PC communication needs.

DJC can satisfy all your data communication problems. We handle a comprehensive selection of devices and equipment, and have the experience to show you how to connect them all.

DJC is an authorized distributor for Racal-Vadic, Micom, General DataComm, Protocol Computers, Anderson-Jacobson, Bizcomp and Ventel.

Next time you need Racal-Vadic, or any other solution to your data communication needs, do yourself a favor—call DJC.

IDMS/R is proving to be what most people expected it to be:

Simply the best.

For nearly a decade, in survey after survey of the data processing community, one database management system was consistently rated first in user satisfaction—IDMS.

So when we announced IDMS/R in April of 1983, expectations naturally were high for a versatile database management system that would combine the ease-of-use of a relational architecture with high performance.

That was the promise we made. And that, in fact, is the product we've delivered.

With IDMS/R, people whose only data processing experience is an encouraging "you can do it" from the dp department are finding themselves able to create their own customized applications. They're doing it quickly, easily and, best of all, *independently*. And that comes as a welcome relief for over-burdened dp personnel.

As for complex, high-volume production applications, IDMS/R is without peer. With an exclusive Cullinet feature called "Relational Fastpath," data processing can tune the database and thereby benefit from a dramatic boost in performance. Moreover, IDMS/R has the most sophisticated back-up and recovery capability of any dbms—an absolute must for on-line applications.

And when one considers that IDMS/R is the cornerstone of the only information management system available today that fully integrates database, applications and decision support software, choosing a relational dbms becomes a very simple decision.

To attend a Cullinet Seminar, phone, toll-free, 1-800-225-9930. In MA, 617-329-7700.

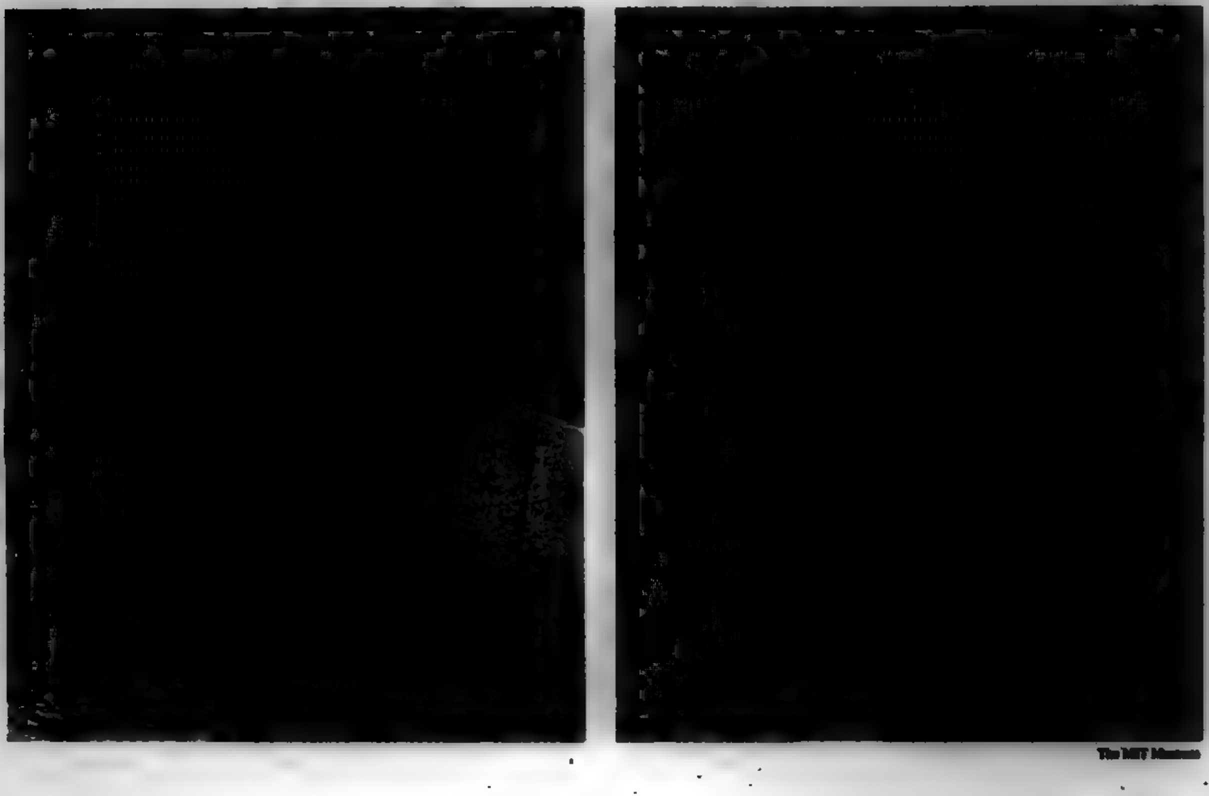
Oddly enough, most offices are better equipped for the future than the people who will create it.



The MIT Museum

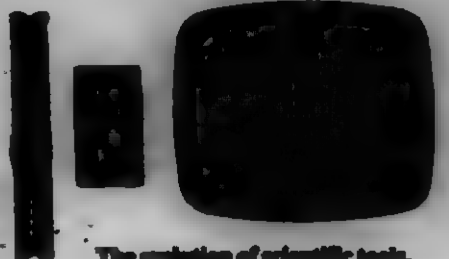
According to recent reports, this last year, businesses spent over $10.5 billion successfully automating America's offices.

Meanwhile, do you realize what many of the scientists and engineers are using to design and develop America's new products?

Hand calculators.

Which is just preposterous.

Especially now that there's computer-aided analysis software designed specifically to do what all technical professionals spend most of their time doing: analyzing data.



The evolution of scientific tools.

It's called RS/1.™ And it's from BBN Software Products Corporation.

RS/1 is fully capable of making technical professionals 4-5 times more productive. Which in turn, will allow them to create considerably better, considerably more reliable new products. In a fraction of the time it now takes.

And it will do so without turning them into hackers. RS/1 works like a research assistant. Not a computer.

Lest you doubt the significance of RS/1, we would hasten to point out that a single copy of RS/1 running on a single computer has already saved one company over $7 million. In one plant. In one year. Without any additional investment in new equipment. They did it simply by allowing their technical professionals to explore alternatives they never had the time to before.

And if you think RS/1 may be something you should look into in the future, you should know that many leaders in American industry are already using it to get their new products out into the marketplace faster.

Don't expect them to tell you about it, though. They'd just as soon you continue spending your money only on getting your letters out faster.

For information on RS/1, call toll-free 1-800-251-1717.

This one's for the VAX and PDP-11.

This one's for the PRO 350/380.

Second-hand computers make more for lessors

By Peter Bartolik
CW Staff

Not all used computer dealers deal with leases, but all computer lessors deal in some manner with used computers.

The leasing of new equipment and used equipment is inextricably tied to the selling of used equipment. That is so because leases are structured around the expected resale or residual value of equipment when those leases expire.

In all leases other than those structured outright to provide ownership of equipment to a lessee upon termination of the lease, the residual value is probably the key component.

When a leasing company provides a user with a piece of equipment for a three-year period for lease payments that will add up to, say, 60% of the purchase price paid by the leasing company, it does so based on the assumption that it will be able to recover the balance plus a profit from the sale of the used equipment after the lease has terminated.

According to the manager of financial services for Framingham, Mass.-based International Data Corp., Charles Greco, who is involved in determining residual values of IBM equipment, the golden rule in determining those values is: "Be accurate or be conservative." According to Greco, when a leasing company writes a lease based on residual values, accuracy will ensure a profit, conservatism will bring greater profit and inaccuracy on the side of overestimating residual values leads to disaster. The most famous case in point, according to Greco, was the bankruptcy of Itel Corp., which saw its overvalued inventory of IBM 370 mainframes devalued overnight with the introduction of the IBM 4300 line.

INDUSTRY SPOTLIGHT

IDC said it bases its determination of residual values on a model developed through the analysis of historic information. IDC has identified four major life cycle phases through which all computer equipment passes, albeit at various rates of speed:

- The active marketing life starting from first delivery of prod-

See RESIDUAL page 23

LESSOR from page 17

ever greater amounts of equipment, they, like the users, do not want to tie up their assets in equipment inventory. In essence, the lessor, with purchased equipment on his hands, looks around for somebody else to buy the equipment, providing the lessor with additional cash to make more deals.

Historically, the traditional vehicle for the lessor has been the nonrecourse or leveraged lease. In this scenario, the lessor, after arranging a lease, puts up 20% or more of the purchase price and obtains the balance from a financial institution in exchange for assigning lease payments to that institution. The lessor makes a commission from assignment of the lease and retains the tax benefits of ownership. The financial institution provides the money based on the collateral value of the equipment and in the event of nonpayment can repossess the equipment, but it has no recourse to seek repayment from the leasing companies.

The newest wrinkle to leasing, and the most profitable and controversial, is the tax-advantage lease, or wrap lease. In this scenario, the lessor merely arranges a lease for a user; the equipment is then sold for a small portion of its actual value to one or more third-party investors who actually lease the equipment back to the user and arrange for the leasing company to administer the lease. Lease payments generally are assigned by the investors to the leasing company for the first few years of the lease. The investors gain tax shelters in that their investments are generating little or no return in those first few years, and various tax credits can be divided a number of ways.

While extremely profitable for leasing companies, the tax-advantaged lease is under constant scrutiny from the Internal Revenue Service, which terms as abusive — and therefore nondeductible — any shelter that provides an investor with no benefit other than the sheltering of income. Both Comdisco, Inc. and Finalco Group, Inc. suffered financial setbacks when it was revealed that the IRS was investigating their use of such lease instruments; investors were scared off by the possibility that the IRS would turn around and disallow the tax deductions at the heart of the lease. Both were effectively given clean bills of health when those investigations were terminated.

However, according to Jon Prager, chairman and chief executive officer of Finalco, the IRS, both before and since the investigation, has assigned an agent to monitor the company's tax-advantage activities. Prager said such scrutiny "is a way of life."

IBM Credit in the resale arena: Estimating its impact

INDUSTRY SPOTLIGHT

By Peter Bartolik
CW Staff

The biggest question facing participants in the third-party market — including lessors and also dealers of used equipment — is the impact that IBM Credit Corp. will have on the resale market.

IBM Credit is writing leases at a phenomenal rate for a three-year-old company. Beginning with a trickle this year, and exploding in following years, IBM Credit leases will begin to expire, and the equipment currently out on lease will become available for resale and on a lesser scale for re-lease.

The Computer Dealers and Lessors Association (CDLA), a trade association representing more than 200 companies in the industry, recently pondered the question of dealing with IBM Credit in the used market. At its fall meeting in New York last month, the CDLA voted in principle to allow IBM Credit to tap into the CDLA's electronic trading network.

A minority of attendees at the CDLA meeting were in favor of banning IBM Credit participation in the network, arguing, according to those present at the closed meeting, that IBM Credit would contribute little equipment for resale by CDLA members and would instead use the access to gain strategic information about its competitors.

The majority view, however, was expressed by Edward Cherney, president of CMI Corp. of Minnesota, who said, "Either we play ball with [IBM Credit] or they will go and play in their own ballfield." Thomas Martin of New Jersey-based Computer Financial, Inc., added that third-party companies have the choice of working with IBM Credit or watching Big Blue's subsidiary develop an alternate distribution channel for used equipment that will freeze out the independent companies.

Charles Greco, a leasing specialist with Framingham, Mass.-based International Data Corp., takes the view that "IBM Credit is in for a big surprise" when it attempts to remarket used equipment. Greco said IBM Credit will be competing in the used market with established firms, such as Comdisco, Inc., that have been successful for 15 to 20 years and that have established distribution channels. "IBM has never marketed used equipment for anything less than list price to users who didn't know any better," Greco said.

But, Greco acknowledged, should IBM Credit attain success in keeping with its dominant parent, "used prices will collapse." If IBM Credit is able to flood the market with used equipment, supply will drive down prices, and residual values will prove to have been inflated for third-party companies and IBM Credit itself.

Even if IBM Credit were to establish ties with the Comdiscos of the third-party market, Greco said, these independent companies will still push their own equipment first, based on fiduciary responsibility to their own third-party investors and on plain business sense.

RESIDUAL from page 22

uct and ending just prior to announcement of a replacement model.

■ Critical replacement period when shipments are at a peak just prior to replacement model announcement and when residuals may experience the first sharp decline.

■ Late life, when shipments of the replacement model are declining and a new model is expected.

■ Residual life, the final stage when the system has twice been superceded and residuals are low.

Key factors affecting residual values during those cycles, IDC said, are availability of replacement systems, IBM price actions and policies, major price actions that may be paving the way for new product announcements and processor capabilities.

In the past, Greco asserted, appraisers of computer equipment residuals were often way off in their estimates, with equipment devaluing at a more rapid rate than anticipated. The problems have generally been with determining residual values of CPU equipment, which have suffered from rapid introductions of replacement products, he said. On the other hand, Greco said, most appraisers generally have underestimated the residual value of peripheral equipment, which generally has a long life span.

Which Very Effective Device Is Used By ICC When Discussing Your Upgrade Options?

Sure, after you've signed on the dotted line, ICC will agree to upgrade your system...but how will they do it...and with what limitations? ICC's primary business is not remarketing used equipment. And that leaves their customers with very few options, and very little flexibility at upgrade time, especially if you have to upgrade before your lease expires.

After over 15 years in the business, *Comdisco is the world's largest remarketer of IBM hardware.* We know that over 70% of our Lessees want to upgrade prior to the expiration of their lease term. And, because 80% of our new business is repeat business, we've learned to listen ...and listen well...to our customers' needs.

- We provide our customers with a choice of upgrades, *new or used*. And that can be crucial when an *entire* used machine may be selling for less than *just* a new upgrade!
- We'll also extend your underlying lease so it's coterminous with your upgrade. In other words, we'll work with your budget, not a manufacturer's quota!
- And we'll *remarket* your used machine ourselves should you decide to replace it rather than install a new upgrade.

With Comdisco, your options are almost unlimited. We'll agree to a guaranteed future upgrade to the initial lease, or agree to duplicate an entire data center should you relocate your center during your lease term.

So choose the leasing company that hears you...at Comdisco, we listen to your total requirements right from the start. Contact your Comdisco Representative today!

Before you sign X_______________, THINK.

Preventive measures essential to data security

CW AT DATA TRAINING

By Maura McEnaney
CW Staff

PHILADELPHIA — Sensitizing employees to the importance of data security is essential to preventing computer crime, data education personnel were told recently.

August Bequai, a Washington, D.C.-based attorney specializing in white-collar crime, told attendees of Warren/Weingarten Publications' Data Training Conference & Exposition at the Adam's Mark Hotel here recently that unless companies educate employees about the importance of security, they may be a likely target for abuse.

"You've got to sensitize your people to the fact that you do have a [security] problem," he said. "Teach them the value of security."

Companies should establish a computer security program that suits their needs, but, the attorney warned, "Don't go overboard — [the computer] is not a safe."

Computer crime is in its "formative years" Bequai said. However, there are several steps that managers can take and signals they can look for to help ward off computer crime, the attorney said. Among them, companies should take note of employee unrest in order to tighten up DP security. Employees unhappy about a particular company could turn to the computer for revenge, the lawyer said.

Companies should also make sure that DP equipment is properly controlled and that only authorized persons have access to the system. Firms cognizant of employee alcohol, gambling or drug problems should also be particularly careful of their computer systems, especially if abuse of the system could result in a funds transfer.

But even with this type of protection, "I bet there isn't a company here today that isn't a victim of white-collar crime," he said, adding that many of those companies have probably not detected those crimes.

Many of the companies that have been victimized by computer crime are often hesitant to bring the case to prosecution for fear of possible ridicule, higher insurance rates or alienating creditors, Bequai said.

In addition, law enforcement officials are hesitant to take on cases of computer and white-collar crime.

For law enforcement officials, the cost of following up on a white-collar crime case is almost prohibitive. "The [district attorney's] office has a $2 million budget and to prosecute a white-collar crime; you can easily expend about a half a million dollars," he said. There are also no federal and only a handful of state statutes that deal with computer crime.

One of the problems associated with computer crime is that "it is difficult to distinguish crime from noncrime," especially in the case of hackers.

OAC '85 scheduled

ATLANTA — The 1985 Office Automation Conference (OAC '85) will be held Feb. 4-6 at the Georgia World Congress Center here.

Sponsored by the American Federation of Information Processing Societies, Inc. (Afips), OAC '85 will offer more than 45 sessions on topics such as organizational impacts, office workstations, ergonomics of the workplace, communications, technologies and issues and productivity.

The registration fee is $125 in advance, $150 on-site. The one-day registration fee is $50.

More information is available from Afips, 1899 Preston White Drive, Reston, Va. 22091.

SCIENCE/SCOPE

Radar and sonar video signals can now be displayed without fading, thanks to a newly developed video image processor. The device converts analog images into digital format so those images can be stored and displayed continuously on a standard television monitor. In addition, images can be shown on remote monitors and be recorded on videotape. The Hughes Aircraft Company processor, using digital storage, offers greater versatility and a wider range of information than analog circuitry. Digital storage allows considerably more flexibility in retaining and updating tight images than previously available using analog circuitry. The processed digital image resembles a conventional TV picture and can be seen in ambient light, eliminating the need for a darkened room.

Weather satellites help airlines save $700 million in fuel bills, thanks to timely pictures and other data. Meteorologists who plan trips for airlines use satellite information to find efficient travel routes. For example, normally the route between Los Angeles and Hawaii is about 2,300 miles. In case of a headwind, the airline will select an alternate route. Even though the new route may be 2,500 miles long, better flying conditions could save the airline $1,500 in fuel. The latest three spacecraft in the Geostationary Operational Environmental Satellite (GOES) system were built by Hughes. The sensing devices, which provide the daytime and nighttime pictures shown on TV and printed in newspapers, were built by a Hughes subsidiary, the Santa Barbara Research Center.

Thermoelectric cooling has made a hand-held infrared viewer more convenient and more economical. The Hughes Probeye™ infrared viewer, originally equipped with argon gas cooling, now comes in an all-electric model. The new version weighs 1.2 pounds less and makes sustained use easier and less tiring. The Probeye viewer sees heat the way a camera sees light, converting it instantly into an image seen through an eyepiece. The viewer is used to spot heat maintenance problems and energy losses in industrial and commercial applications.

The first attempt to sample the atmosphere of an outer planet, NASA's Project Galileo will journey 750 million miles to Jupiter this decade. The mission will consist of two spacecraft, an orbiter and a Hughes-built probe. Six instruments inside the probe's descent module will assess the structure and composition of the atmosphere, determine the location and structure of clouds, calibrate a precise ratio of hydrogen and helium, and measure lightning, radio emission, and energy absorption. The probe will transmit data to the orbiter for relay to Earth. Project Galileo will be the first interplanetary vehicle launched from the space shuttle. The launch is set for May 1986 and arrival for August 1988. Four Hughes-built probes explored the atmosphere of Venus in 1978.

Hughes needs engineers, scientists, and programmers to design and build advanced airborne and spaceborne radar systems, including data links, electronic warfare systems, and display systems. We need systems analysts (communications and control theory, signal processing, applied mathematics), microwave specialists (antennas, receivers, transmitters, data processors), circuit designers (analog, digital, RF/IF), scientific programmers, mechanical designers, and systems and test engineers. Send your resume to Engineering Employment, Dept. 83, Hughes Radar Systems Group, P.O. Box 92426, Los Angeles, CA 90009. Equal opportunity employer. U.S. citizenship required.

For more information write to: P.O. Box [illegible], Dept. [illegible], Marina del Rey, CA [illegible]

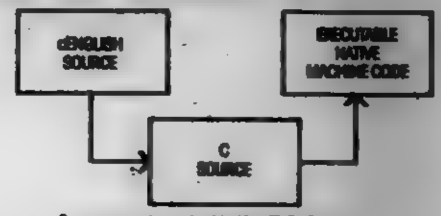
HUGHES

cENGLISH™

The C Generation Language.

What is cENGLISH? cENGLISH is a comprehensive fourth generation procedural language based on dBASE II™ syntax. It is portable to a wide range of micros and minis. The language features user-transparent interfaces to a wide range of popular C compilers, operating systems, and data base managers.

How is portability achieved? cENGLISH through its compiler interface translates cENGLISH into documented C source and uses a host C compiler to produce native machine code.



C source can be embedded in cENGLISH source.

Differences in the operating system and data base manager are handled by the runtime libraries.

The result is that cENGLISH source can be compiled without modification on any micro or mini configuration supporting cENGLISH.

What about performance? cENGLISH executes FAST, just like any compiled C program.

How easy is cENGLISH to use? While cENGLISH is a powerful high level language that can accommodate complex software development, it remains simple and straightforward to use.

Call or write for availability of cENGLISH for the following configurations—

Compilers:
  Standard O/S compilers: Lattice C™ for MS/DOS™
Operating Systems:
  UNIX,™ UNIX-like, MS/DOS,™ Coherent,™ VMS™
Data Base Managers:
  C-ISAM™ and INFORMIX,™ UNIFY,™ ORACLE,™ PHACT,™ Logix™
Foreign Language Versions:
  German, French, Spanish

Attention MS/DOS users. Demo version and special introductory offer available for IBM PC,™ XT,™ AT,™ and other MS/DOS systems. Requirements: 256K, hard disk or two floppy disk drives, and MS/DOS 2.1 or higher.

Attention dBASE II and dBASE III users. dBASE II to cENGLISH Converter now available; dBASE III Converter available later this quarter. Converted code is portable to micros or minis and executes as fast as original cENGLISH source.

dBASE II and dBASE III are trademarks of Ashton-Tate. Lattice is a trademark of Lattice, Inc. UNIX is a trademark of Bell Laboratories. MS/DOS is a trademark of Microsoft, Inc. Coherent is a trademark of Mark Williams Company. VMS is a trademark of Digital Equipment Corporation. C-ISAM and INFORMIX are trademarks of Relational Database Systems, Inc. Oracle is a trademark of Oracle Inc. PHACT is a trademark of Phact Associates. Logix is a trademark of Logical Software, Inc. IBM PC,XT and AT are trademarks of International Business Machines Corporation. UNIFY is a trademark of Unify Corp.

Speaker gives tips on buying, installing local nets

CW AT POAC

By Mitch Betts
CW Washington Bureau

WASHINGTON, D.C. — Organizations looking to install a local-area network should steer clear of vendors likely to fall victim to the forthcoming shakeout and should recognize that network vendors generally provide no support after the sale, according to Connie Zuckerman, a senior consultant with Arthur Andersen & Co. here.

In a comprehensive presentation at the recent Federal Office Automation Conference here, Zuckerman provided attendees with tips on selecting and installing local-area networks based on her experience in OA projects.

She asserted that OA managers frequently underestimate the amount of time and effort required to implement a local-area network. A successful project, she said, will require a careful OA systems development methodology that includes planning, design, installation and systems management phases.

Zuckerman made the following suggestions for avoiding pitfalls in each stage:

- In the planning phase, create a steering committee with members from the data processing, communications, office automation and user staffs. Determine user requirements for applications software, security and outside data bases, as well as the technical requirements and size of the system.
- Do not let the technology — or the vendor's sales pitch — drive the decisions; make decisions based on user requirements.
- Evaluate the vendors, keeping in mind the coming shakeout.
- Design, install and test a prototype network, especially for large networks.
- Do not neglect systems administration once the network is installed. It is a time-consuming job that requires assigning responsibility for network planning and security; providing user-friendly documentation; establishing procedures, such as for backup and recovery; and user training.

Another speaker, Walter H. Mackie of the U.S. Navy, agreed, saying the network vendors are motivated only to make more sales, not to provide user support.

Mackie, who is deputy director of the Navy Secretariat's office automation and communications system, described his efforts to develop a local-area network to serve the Navy and Marine Corps headquarters commands in the Washington, D.C., area. A multivendor pilot version of the network is expected to be implemented in fiscal years 1985 and 1986, he said.

Zuckerman CW Photo by M. Betts

In addition, Mackie said his office has developed a Document Interchange Format (DIF) standard to permit the exchange of text between systems supplied by different vendors.

He described the DIF as a "software filter programmed by each vendor to allow conversion to and from the agreed-upon standard."

Datapoint Corp., Wang Laboratories, Inc. and Xerox Corp. were recently validated as complying with the DIF, Mackie said.

ICCA lists firms on-line

ST. LOUIS — The Independent Computer Consultant's Association (ICCA) has put the national directory of its 1,500 member firms on-line with the Compuserv Corp. videotex service.

The action will permit Compuserv users to seek out ICCA consultants on the basis of the consultant's specialization, location, personal or company name or other criteria.

ICCA members are all full-time consultants, the association said, adding that 60% of the membership specializes in commercial consulting and 40% specializes in scientific consulting.

More information is available from ICCA through Box 27412, St. Louis, Mo. 63141.

BUILDING A COMPUTER CENTER?

If you're planning a new expanded or remodeled DP facility, you need Datasphere's help.

Since 1968 Datasphere's unique combination of products and services has saved dollars, frustration and time for large and small firms around the world.

From turnkey—design/build computer rooms to the smallest support equipment, we'll do all or part—on schedule, within budget! Datasphere is unique—we're engineers, contractors and suppliers specializing in computer facilities.

Supplying a full line of support equipment, including:

- *Uninterruptible Power Systems*
- *Computer Power Centers*
- *Computer Fire Protection Systems*
- *Computer Type Air Conditioning*
- *Gas Turbines/Diesel Generators*
- *Operation Command Centers*
- *Elevated Flooring*
- *Frequency Converters*
- *Line Filters*
- *Security Systems*
- *Systems Monitors*
- *Voltage Regulators*

Electronic mail, EFT demand tighter security controls

CW AT FOAC

By Mitch Betts
CW Washington Bureau

WASHINGTON, D.C. — Security experts told attendees at the recent Federal Office Automation Conference (Foac) here that the emergence of electronic mail, local-area networks and electronic funds transfer (EFT) have all heightened the need for hardware and software security controls.

"A lot of corporations would like to use electronic mail . . . but they're afraid to. They are concerned about who has access to it, so they are willing to use electronic mail for routine matters, but not for sensitive matters," observed Stephen T. Walker, president of Trusted Information Systems, Inc. of Glenwood, Md.

Walker, a former Department of Defense official, urged OA managers to establish classifications for the sensitivity of business information much as the military does, and then obtain computer operating systems that control each person's access to each category of data.

He pointed out that the Department of Defense Computer Security Center at the National Security Agency in Fort Meade, Md., has an evaluation and rating system for security software products [CW, Sept. 17].

These trusted computer systems should be part of an overall program that includes physical, procedural and personnel security, he stressed.

Another important security area is the encryption of data communications, Walker said, noting that the U.S. Department of the Treasury recently established a new policy to assure the integrity of the department's EFT data.

Walker

Treasury Secretary Donald T. Regan, in an Aug. 16 directive, said that by June 1988 all Treasury Department EFT transactions must be authenticated, conforming to the Ansi Standard X9.9 for Financial Institution Message Authentication and the National Bureau of Standards (NBS) Data Encryption Standard. Dennis Branstad, manager of computer integrity and security technology at the NBS, said that this requires the EFT message to be sealed so that any replacement, reordering, deletion or repetition of the message or characters can be detected.

Dennis Steinauer, a computer scientist at NBS, discussed the security implications of the proliferation of desktop personal computers, each one equipped with user-friendly features that make security difficult.

Steinauer emphasized that personal computers typically lack the built-in security features that mainframe computers have, such as multiple processor states, privileged instructions and memory protection. "Without such hardware features, it is virtually impossible to prevent users from accessing or modifying parts of the operating system. Therefore, users can circumvent any software controls," he said.

Steinauer said there are products on the market that can mitigate security concerns about personal computers. He noted that next year NBS will issue federal guidelines for the security of small computer systems, and it is working on standards for password usage, data integrity and local-area network security.

Choice of micro vs. workstation

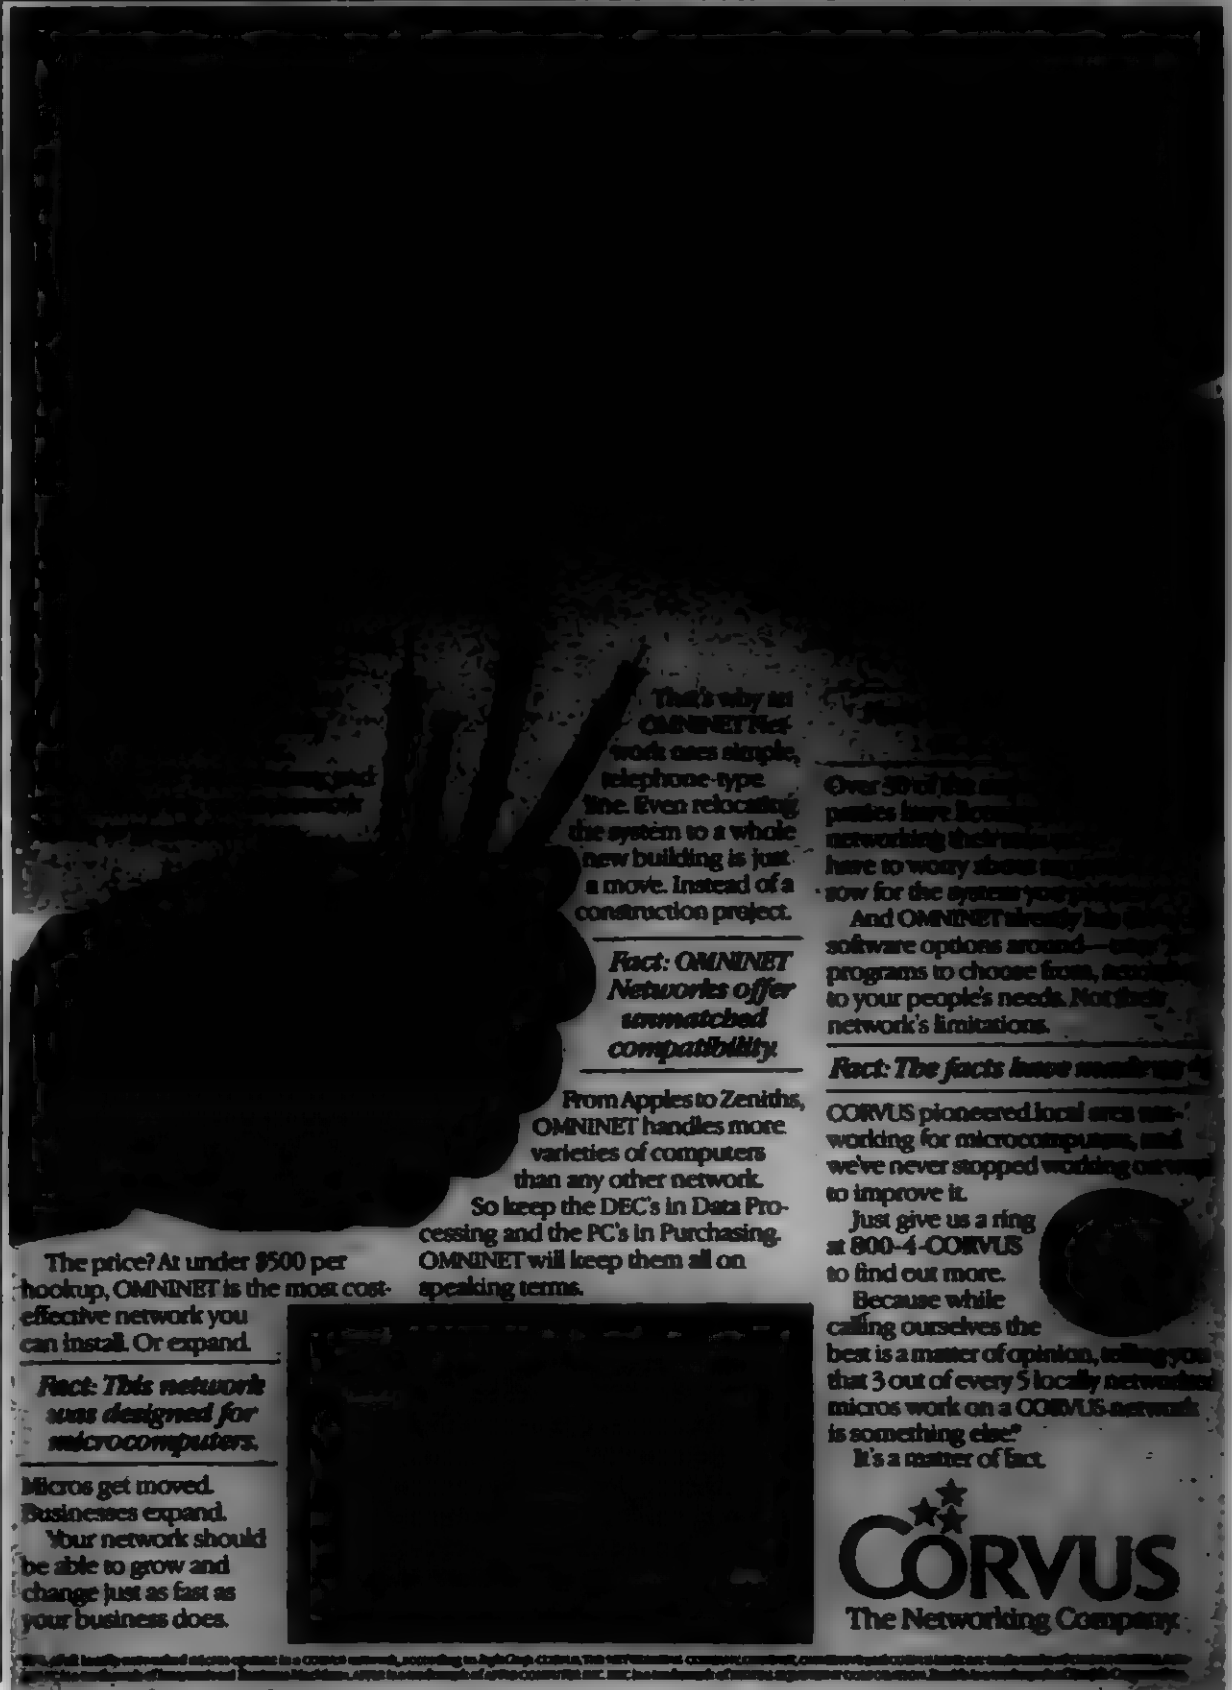
By Mitch Betts
CW Washington Bureau

WASHINGTON, D.C. — The office automation market has evolved to the point where personal computers and advanced workstations can both find niches in large organizations, according to speakers at the recent Federal Office Automation Conference here.

Deborah L. Fain, vice-president of Samna Corp., an Atlanta-based vendor of office software for microcomputers, stressed that a personal computer is a flexible, generic product, while a workstation is designed to be part of a total system aimed at a specific type of user.

Evaluating both forms of end-user computing, Fain said that the flexibility of the personal computer's open architecture makes it a more versatile tool than the workstation.

The personal computer's open architecture encourages the use of innovative software and peripherals. "The advanced workstation integrates all the hardware and software that the job function demands" in a closed architecture that does not easily accept enhancements, she said.



That's why an OMNINET Network uses simple, telephone-type line. Even relocating the system to a whole new building is just a move. Instead of a construction project.

Fact: OMNINET Networks offer unmatched compatibility.

From Apples to Zeniths, OMNINET handles more varieties of computers than any other network.

So keep the DEC's in Data Processing and the PC's in Purchasing. OMNINET will keep them all on speaking terms.

The price? At under $500 per hookup, OMNINET is the most cost-effective network you can install. Or expand.

Fact: This network was designed for microcomputers.

Micros get moved. Businesses expand.

Your network should be able to grow and change just as fast as your business does.

Over 30 of the [illegible] panies have [illegible] networking their [illegible] have to worry about [illegible] sow for the system you [illegible]

And OMNINET already has [illegible] software options around— [illegible] programs to choose from, [illegible] to your people's needs. Not their network's limitations.

Fact: The facts have [illegible]

CORVUS pioneered local area networking for microcomputers, and we've never stopped working on ways to improve it.

Just give us a ring at 800-4-CORVUS to find out more.

Because while calling ourselves the best is a matter of opinion, telling you that 3 out of every 5 locally networked micros work on a CORVUS network is something else.*

It's a matter of fact.

CORVUS
The Networking Company.

NEWS

INTERNATIONAL REPORT

CW International News Network

JAPAN

TOKYO — Japan's Big Six computer makers have reported glowing financial results for fiscal year 1984. Leading the pack was Mitsubishi Electric Corp., which showed a 53% growth in computer-related sales from the same period in 1983. All six companies increased office automation sales in Japan as well as computer sales abroad. Fujitsu Ltd. has grown 28%; NEC Corp. has increased 28%; sales at Hitachi, Ltd. are up 25%; Toshiba Corp. is up 25%; and Oki Electric Industry Co. showed an increase of 20%.

■

TOKYO — The recent Fifth-Generation Computer System International Conference here focused on the programming language Prolog, along with the development of a parallel processing machine, artificial intelligence and future international cooperation. Progress on Japan's own fifth-generation project at the Institute for New Generation Computer Technology (Icot) was discussed. The Icot AI machine is said to feature a conversation function and an inference function.

■

TOKYO — Fujitsu, Ltd. has introduced a net environment called Fujitsu Network Architecture 4 (FNA4) that is said to provide integrated information systems with the following five communications capabilities: wide-area networking, large-scale networking, access to corporate information net systems, local-area networking and standardization. FNA4 can support satellite communications, videotex communications, digital transmission services and facsimile services. The net is reportedly capable of supporting up to 10,000 terminals.

KOREA

ICHON — Hyundai Semiconductor and Western Design Center, Inc. (WDC) have entered a technology exchange agreement involving WDC's 8- and 16-bit Cmos versions of the 6502 microprocessor. Under the terms of the agreement, Hyundai will manufacture and market the WDC devices here and also in its new Santa Clara, Calif. facility.

THE NETHERLANDS

AMSTERDAM — The European market for professional micros will see a tenfold growth in a six-year period, according to a recent report from International Data Corp. here. The study also revealed that the relative market shares of 8- and 16-bit systems will be reversed by 1989. The Netherlands had an installed micro base totaling 18,500 in 1983 and an average annual growth rate of 54%, which will result in an installed base of 250,000 by 1989. It is estimated that the nearby Belgian market will grow annually by 47%.

■

AMSTERDAM — The Dutch group Philips Information Systems, Inc. and the German group Siemens AG will cooperate in the joint research and development of high-density memory chips. The vendors' five-year project will focus on the production of 1M- and 4M-bit memory chips at facilities in Nijmegen, Netherlands, and in Hamburg, West Germany. Both companies are expected to invest roughly $150 million, with additional funding coming from the two countries' governments.

■

THE HAGUE — Deregulation of the Dutch telecommunications industry has become a hot topic here, sources said. An investigative committee contacted the research group McKinsey, Inc. to complete a future-status report before mid-1985. The Postal Telephone and Telegraph (PTT) agency will retain its monopoly on telecommunications, telex and data infrastructures, but will lose control of peripheral equipment.

Furthermore, the financial relationship between the PTT and the government will be loosened. The future structure of communications here will be built around three entities: a public entity, an entrepreneurial entity and the ruling entity modeled after Oftel in the UK.

Comdex: pacing micro evolution

Perhaps the only part of the computer business that has evolved faster than the business itself over the past few years is the annual fall Computer Dealers Exposition, also known as Comdex. This harvest home of the microcomputer season started last Wednesday and ended just yesterday, and show sponsors were expecting some 100,000 attendees to converge on the miles of aisles lined with some 7,000 (yes, seven thousand) display booths.

Comdex has come to serve as a compass from which readings of the direction of the microcomputer business can be accurately taken. True to this form, the show's beginnings six years ago were marked by negligible interest on the part of serious business users, as the micro was more a toy of the hobbyist than anything else. Last week, the eyes of corporate DP management were focused on the networking achievements that vendors brought to Las Vegas, as managers continue to grapple with the increasingly complicated issues of integrating into mainframe environments the millions of micros now installed in major companies everywhere.

Comdex has also borne out the cyclical nature of the micro business, where a rash of hardware announcements one year has been followed by an onslaught of software operating system and application software debuts, which, in turn, are followed by the next generation of hardware. For example, in 1982, Comdex was predominantly a hardware extravaganza, where dozens of vendors dragged their IBM Personal Computer look-alikes out of the laboratories and onto the show floor.

In 1983, software to run on the Personal Computer and compatibles highlighted the show, while IBM and others were preparing the next round of more powerful 16- and 32-bit micros, with IBM continuing to pull the micro business in its wake. In fact, according to one report, there were approximately 10,000 IBM Personal Computers on the Comdex floor last year, demonstrating the pride of the software vendors.

In 1984, Comdex featured not only the much more sophisticated integrated packages supported by these high-powered machines, but also the communications software that micro managers are demanding. The hardware featured at the show was not computers, but elegant laser printers, which today can be had for under $6,000, compared with $30,000-plus just a couple years ago.

And now, of course, the traditional mainframe software and hardware vendors are the ones that stand out in the Comdex crowd, as the show has taken on more the appearance of the National Computer Conference than a dealers' confab. For those attending the show, this proves more a nightmare than a blessing.

Finally, it is worthy of mention that, despite an actively ongoing shakeout in the microcomputer business, more vendors (1,400) than ever were exhibiting at Comdex.

LETTER

Avoiding memory loss in 4381 upgrade

The article, "IBM DOS/VSE users lose memory in 4381 conversion" [CW, Oct. 29] failed to mention methods for resolution of the problem. Converting E mode VSE to 370 mode is the least desirable aspect of installing a 4381 computer (due to the memory loss) and is probably the most difficult approach.

The easiest solution is to install the VM/SP that will support the VSE E mode processing on the 4381. While additional cost and processing overhead is incurred, the simplicity of a straight hardware installation is possible, without major concern given to extensive operating system conversion and testing. In addition, for the users that are under severe virtual storage constraints, the VM/SP offers another avenue for memory expansion without converting to an operating system with extended addressing capability or waiting for the new VSE/SP release that supports the Extended Architecture.

I suspect, however, the whole idea of the article was not to warn future 4381 users of virtual storage loss as much as it was intended to take a shot at IBM and their marketing practices. I would be the last person to say that IBM support offers complete satisfaction, but for the user who knows how to ask the appropriate questions, timely guidance and advice can be obtained. The key to asking the right questions is full and complete information from a variety of sources.

VIEWPOINT

Software escrow not a guarantee for protection

READER'S PLATFORM
L.J. Kutten

The article "Firm utilizes software escrow for access control" [CW, Oct. 29] gives the unwarranted impression that software escrow can be a panacea that will protect a software developer's proprietary information while at the same time guaranteeing "access by interested parties in case of product discontinuance, bankruptcy, theft and copyright and trade secret infringement."

Based on my research, this just is not always true. As an analysis of each issue could easily take 70 pages, I will explain the ramifications of a software developer's bankruptcy on a software escrow agreement.

For the purpose of further discussion, the three following assumptions are required:

- The software developer (the escrower) has filed for bankruptcy, either voluntary or involuntary, or for corporate reorganization.
- A bankruptcy trustee has been appointed, and the escrow agreement calls for delivery.
- The agreement calls for delivery of the escrowed material upon the escrower's filing for bankruptcy.

Unless the escrow company has been formally authorized to take charge of the debtor's property for the general benefit of the debtor's creditors (usually by contract or court order), it is deemed a noncustodian of the debtor's property. Typical noncustodians include bailees, pledgees, a co-owner and an escrow holder.

As long as the debtor retains any title to the property at the time of the bankruptcy filing, the property belongs to the debtor's estate. This property includes all property in which the debtor has any legal or equitable interest, including any interests in copyrights, patent rights, trademarks and trade secrets.

Accordingly, the bankruptcy trustee can require a noncustodian to turn over to it all property of the estate, including any software held in escrow.

If the escrow company is a custodian and has knowledge of the bankruptcy, then under 11 U.S.C. 543, it must take appropriate steps to preserve and protect the property (for example, refuse to turn it over to the software consumer), and it must turn the property over to the trustee.

> *So long as the debtor retains any title to the property at the time of the filing, the property belongs to the debtor's estate. This property includes any interests in copyrights, patent rights, trademarks and trade secrets. Accordingly, the bankruptcy trustee can require a noncustodian to turn over to it all property of the estate, including any software held in escrow.*

The fact that the escrow beneficiary has a contract with the debtor/escrower is unimportant. Under 11 U.S.C. 365 (a), a bankruptcy trustee may assume or reject an executory contract (that is, a contract in which both sides have a future obligation).

For example, Select-A-Seat Corp. developed and marketed a software package that allowed for remote sales of athletic and entertainment tickets (625 F2d 290, 9th Cir. 1980). In November 1975, Select-A-Seat sold exclusive rights to Fenix to use and license others to use Select-A-Seat's software. This right was contingent upon Fenix paying Select-A-Seat $140,000 plus a promise to pay 5% of the income generated for 10 years. In addition, Select-A-Seat promised not to provide the program to any other party.

On Dec. 3, 1976, Select-A-Seat filed for bankruptcy. On May 19, 1977, the trustee rejected the licensing agreement as executory. Fenix appealed, claiming it was not executory because it had paid and received an exclusive license to the program. The appeals court reject this and said the contract was executory because Fenix had a continuing duty to pay a royality, and Select-A-Seat had a duty not to license others to use the program.

As a result, the trustee was allowed to sell and/or license the program to others. As a general rule, if the software is usually updated, and the updating is required by contract, that contract is executory. If it is executory, the software license agreement can be rejected. If it is rejected, the license cannot protect the nondelivery of the escrowed material.

Trustee may sell debtor's assets to third party

The trustee can also sell the assets of the debtor to a third party, notwithstanding any provision in the original escrow agreement or licensee agreement to the contrary.

The only caveat is that where the debtor only holds legal title to the property and it is being held for the benefit of another, the trustee may not sell the property if the sale will be detrimental to the beneficial owner [see 11 U.S.C. 541(b)].

It should be noted that bankruptcy law 11 U.S.C. 541(c) specifically prohibits any contract language that purports to transfer the property of the debtor to any other party that is "conditioned on the insolvency or financial conditions of the debtor . . . or on taking possession [of the assets] by a trustee."

Finally, an escrow beneficiary cannot immediately sue the escrow service or the supplier in a local court to compel delivery of the source code and documentation.

The bankruptcy court has exclusive jurisdiction over all property of the debtor and all issues and cases that affect or concern the property of the debtor. If the user wants to sue, he must do so in a bankruptcy court. ‡

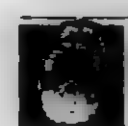
DP center must gird for challenge of OA implementation



HUMAN CONNECTION
Jack Stone

Automating the office has become a mighty challenge for the best of today's technical minds. The issue of dealing with the convergence of word processing and data processing technologies, which have dominated the industry for so long, has been compounded by the necessary consideration of multiple technologies that have either reached a reasonable level of maturation or will do so soon.

These days, it does not make sense to initiate office automation planning without taking into account the many cost-beneficial alternatives (and the following list is not intended to be all-inclusive):

- Electronic mail systems configured with facsimile devices and optical character scanners to transmit combined typewritten and handwritten text plus graphics material.
- Devices of various levels of intelligence for remote access to office-level computer facilities, including notebook computers and cellular radiotelephones.
- Powerful personal computers with integrated applications software and a broad range of communications add-ons.
- Combined voice, data and video workstations and switching devices for a variety of applications within local-area networks.

Rapid-fire OA developments

In spite of these rapid-fire developments, many leaders of large organizations do not appreciate that, nowadays, the complexities of systems planning for office automation projects are approaching those of large-scale mainframe projects. This should not come as a great surprise because of the growing processing power of office systems.

Therefore, to do the OA planning job right, the organization requires much the same kind of talent that is found in the DP center systems analysis department. And that's where the executives figure they will go to pry loose the OA analysis capability. If your DP center has not yet felt the pressure to divert preciously guarded systems people to OA, then take heed — they soon will.

Not surprisingly, OA analysts have difficult tasks ahead because, as is the case for mainframe systems analysts, their attention is directed as much to management, personnel and organizational matters as to issues dealing with the technology. The first need in this situation is to identify realignments in the current flow of information processing to take full advantage of the new OA connection. This effort is, of course, well established in the mainframe systems planning cycle. Such changes may require as little as a few minor modifications in existing manual procedures or as much as a divisional reorganization.

But as we have all come to learn, mostly the hard way, getting office users to change the ways they have done business, however slightly, is not accomplished overnight and may take years, particularly when manual procedures have been operative for decades.

To implement such changes, OA analysts must be unusually gifted in dealing with people. They should be able to relate easily to office users during the entire systems development process and be available to offer assistance to make users' jobs easier and their time more productive. OA analysts ought to be capable of convincing managers and supervisors of the value of an OA project by relating the prospective implementation of new technologies to one of the following:

- Improvements in operations.
- Decreases in operating expenses.
- Expansions in services to customers or constituencies.

Finally, the OA analyst should be experienced in training and possessed of the patience and sensitivity necessary to deal with non-DP-oriented professionals in an effective way during OA implementation. ‡

SOFTWARE & SERVICES

Hobbyist makes program development look easy

By Paul Gillin
CW Staff

TULSA, Okla. — At Clyde Petroleum, Inc. here, petroleum engineer Jack Coursey is bringing new meaning to the words "end-user computing." Coursey, a longtime computer hobbyist with no formal DP training, has replaced a data base application originally written on an IBM System/34 with a similar one he developed on an IBM Personal Computer XT using a high-level programming language and data base management system.

Coursey's application is a storage and retrieval program for production data for oil and gas wells. The data base encompasses information about oil, gas and water production data, test data, lease background information and information about division of interests. It will eventually encompass about 700 wells. Coursey used Information Builders, Inc.'s PC/Focus to build the data base.

The application uses three data bases that can be dynamically linked for reporting, Coursey said. The data bases include lease data, production and test data associated with leases and an inventory data base of field equipment. "If I want the total history of a well sorted by county, for example, I have to pull more than one data base to do it," he said. "I've got well over 200 leases on the data base right now."

To handle the size of the data base, Coursey added a Tallgrass Technologies Corp. 45M-byte hard disk to the Personal Computer XT. The engineer relied largely on past experiences and common sense to design the application. "You basically draw a flow chart of how you want to look at data, and that's how you want to store it," he said.

To test for accuracy, Coursey wrote programs on PC/Focus that generated reports similar to those already employed on

With no experience in formal development, Coursey basically used the prototyping capabilities of PC/Focus to make changes.

Productivity gauge changing

Since 1981, a new kind of software productivity benchmark called "function points" has started to replace "lines of source code" as a standard measure for software productivity. The reasons for this, and what is likely to result from the switch, are turning out to be very significant.

From the time that software production began more than 30 years ago, measuring the productivity of software projects has been a major problem. During the early years of professional programming, measurements based on lines of

Micro Tempus revamps micro-mainframe link

MONTREAL — Micro Tempus, Inc. has announced what the company labeled a totally redesigned version of its Tempus-Link microcomputer-to-mainframe link that features improved performance and additional functions.

According to a spokesman, Version 3.1 of Tempus-Link offers performance capabilities that include more efficient use of terminal buffers, shorter path lengths between modules and improved translation and compression algorithms. The performance features are said to increase mainframe capacity and capability. Tempus-Link supports a variety of mainframe operating environments, including IBM's CICS, TSO and CMS and the entire line of IBM and IBM-compatible micros.

The spokesman said other additions to Tempus-Link include a translation table, a conversational tutorial and full screen presentation and windowing capabilities that make the link easier for end users to operate. Version 3.1 also comes with the Tempus-Link Application Program Interface (API) and Host Application Program Interface (Hapi).

Permit integration of environments

The two interfaces permit integration of the micro and mainframe environments. They allow the user, for example, to write micro programs that call mainframe applications as subroutines, which are then reportedly transferred to the micro program transparently to the user.

The spokesman said Version 3.1 also allows users to configure programs according to a variety of options. Beginners are guided through a series of tutorial menu choices when they access the system, and experienced users can move more quickly through Tempus-Link by bypassing familiar options, the spokesman said. An additional enhancement to the system, which the spokesman described as a statistics capability, enables users to generate information about the transmission of data, including speed and efficiency of data transfer, number of errors and other information.

Version 3.1 of Tempus-Link is priced incrementally on the basis of maximum concurrent users. A basic five-user version is priced at $6,175. A 100-user version costs $39,000. The next increment of 100 users is priced at $11,700. Users of the complete Tempus-Link 2.0 product, including Hapi and API, can upgrade to Tempus-Link 3.1 at no charge. Other Tempus-Link users can upgrade to Version 3.1 for a 30% charge as long as their minimum configuration is five users.

Micro Tempus is located at Suite 300, 440 Dorchester Blvd. W., Montreal, Quebec, Canada H2Z 1V7.

AT&T compiles Unix definitions for software developers

NEW YORK — AT&T Information Systems has announced that it will publish a definition document for its Unix System V. The document is intended to serve as a guide for software developers who want to write applications that are portable across the various System V implementations.

The "System V Interface Definition" will define a minimum set of system calls and library routines that should be common to all operating systems based on Unix System V. The initial document will be released in January at a nominal charge, according to an AT&T spokesman. It will be followed by further papers defining optional extensions to the basic definition.

The communications giant also said it will offer a service to help system developers conform to the System V Interface Definition. The service will be made available to System V licensees during 1985. It will test implementation of Unix System V for conformance to the definition.

Boosting a solid commitment

"It is letting the entire computer community know that [AT&T is] solidly committing [itself] to a standardized System V Unix," said Harry Layton, software systems product verification manager for AT&T Technologies.

Unix observers and software developers said the announcement should not be taken as a significant statement about Unix. "I think it's a nonevent," said David Fiedler, editor of "Unique," a Unix newsletter. "I don't think it's anything new because it's stuff that's been available all along."

However, Fiedler said the specifications should provide some reassurance to developers. "Before, they could just copy the system calls. This gives them an added reassurance that what AT&T says is going to be the actual interface."

Jeff Stives, marketing communications manager at Plexus Computer, Inc. said the usefulness of the standard will depend upon AT&T's commitment to adherence. "For the moment, issuing a spec and adhering to it are two different things," he said. But he added, "Each time AT&T ups the ante on Unix, it benefits our market."

CA-Universe upgrade released

JERICHO, N.Y. — Locking algorithms, IBM Vsam transparency and support in IBM's VM/CMS for multiple minidisks are among the enhancements included in Computer Associates International, Inc.'s Release 2.1 of CA-Universe relational data base management system.

According to the company, users of IBM's DOS/VSE do not have to modify programs using Vsam files while CA-Universe's transparency feature is being used.

All security and recovery systems, such as IBM CICS journaling and CICS automatic transaction backout, reportedly continue to run while the system's transparency capabilities are utilized. In addition, the release is said to require no modification to CICS or C... functions.

Supports multiple disks

The enhanced release is said to support multiple minidisks within VM/CMS or the CA-Universe data base. A multiextent data set has been implemented so that one data base table can now span multiple minidisks, the company said.

CA-Universe is priced at $140,000 for IBM's OS/VS, MVS and VM/CMS operating systems. The product costs $110,000 for the DOS/VSE environment.

Computer Associates International is located at 125 Jericho Tnpk., Jericho, N.Y. 11753.

SYSTEMS SOFTWARE

CALIFORNIA SOFTWARE, INC.
Netman 3.0

California Software, Inc. has released a version of its on-line data communications and data center management system.

Netman 3.0 is said to include more than 50 enhancements, including reverse paging, faster mass updating capabilities and a faster response time. The new version also includes an optional On-line Customization Facility. The product supports IBM's MVS/TSO, MVS/CICS, VS1/CICS, VM/CMS and DOS/VS/CICS.

The software update is available to Netman users free of charge. The On-line Customization Facility will be offered to existing users until Dec. 31 at $15,000 for a perpetual license. After that date, the price of the option to existing and new users will be $20,000. A perpetual license for the Netman 3.0 for the MVS operating system remains at $37,500.

California Software, 3232 Nebraska Ave., Santa Monica, Calif. 90404.

UNIQUE AUTOMATION PRODUCTS, INC.
UAP-Link enhancement

Unique Automation Products, Inc. has announced that its UAP-Link micro-to-mainframe communications software now runs with Digital Equipment Corp. VAX-11 systems under DEC's VMS operating system.

According to the vendor, UAP-Link now permits VAX systems to transfer files to another VAX or to control groups of micros or interconnect with other vendors. The link is said to work on IBM Personal Computers and compatibles, DEC Rainbow microcomputers running under Microsoft Corp.'s MS-DOS operating system and Digital Research, Inc.'s CP/M 86 operating system.

It also runs with DEC's PDP-11 minicomputer, as well as under Unix operating systems, IBM's VM/CMS operating system and Data General Corp.'s AOS/VS operating system, the company said.

The new release includes both control and host modules and is priced at $1,250.

Unique Automation Products, Suite G, 15401 Red Hill, Tustin, Calif. 92680.

NETWORK APPLICATIONS, INC.
Transnet enhancement

Network Applications, Inc. has announced that its communications software now runs with office systems from Digital Equipment Corp. and Data General Corp.

According to Network Applications, through the use of IBM's Document Interchange Architecture and Document Content Architecture, Transnet allows multiple-vendor office systems to communicate through the host's IBM Systems Network Architecture Distribution Services. Transnet permits office systems from IBM, Wang Laboratories, Inc. and Xerox Corp. to exchange text documents, which can then be edited by any of the systems.

In addition to DG's CEO office system and DEC's All-In-One office system, electronic mail systems from the two companies will also be usable with any Transnet-supported systems from DEC, DG, IBM or Wang Laboratories.

Transnet has a base price of $35,000.

Network Applications, 9020 Capital of Texas Highway N., Austin, Texas 78759.

WHITESMITHS, LTD.
Enhancements to Pascal and C compilers

Whitesmiths, Ltd. has announced that its Pascal and C compilers for IBM 370 mainframes have been enhanced to provide optional cross-compiler support. The company also announced that the compilers are now available for IBM's VM/CMS.

According to the company, the optional cross-compilers support the Intel Corp. 8080 and 8086 microprocessors and Motorola, Inc.'s 68000 microprocessor.

Each cross-compiler reportedly can generate free-standing programs. The 8086 option can also generate programs executable under IBM's PC-DOS operating system, the company said. The 8080 processor supports Digital Research, Inc.'s CP/M 80, and the 68000 option supports Digital Research's CP/M 68K-byte operating system, according to Whitesmiths.

The VM/CMS option is standard with the C/370, priced at $5,000. Each of the cross-compilers is priced at an additional $5,000.

Whitesmiths, 97 Lowell Road, Concord, Mass. 01742.

ADVANCED SYSTEMS CONCEPTS, INC.
Status/38

Advanced Systems Concepts, Inc. has announced a resource accounting product said to be compatible with the IBM System/38 under Release 6.0 of the CPF operating system.

The accounting features of Status/38 reportedly track all facets of system use. Total job execution time, CPU use time, response time, printer and paper use and disk space utilization are included, the company said. The product reportedly allows jobs to be grouped for departmental reporting.

Status has a one-time license fee of $1,500, the vendor said.

Advanced Systems Concepts, Suite S, 1350 Remington Road, Schaumburg, Ill. 60195.

The nicest thing about IDMS/R on a 4300 is how easy it is to build with.

It's a rare data processing department that doesn't have a backlog of applications, and nowhere is the problem more acute than among 4300 users. With fewer people typically to develop applications, fewer applications typically have gotten developed.

Adding more applications developers might seem one way to combat the problem. But we'd like to suggest a more sensible approach. A way to enable you to get more productivity out of your existing dp staff. It's called IDMS/R.

Cullinet's powerful new relational database management system, IDMS/R greatly reduces the time it takes to develop applications. Its Automatic System Facility (ASF), a major advance over fourth generation languages, is so simple to use, end users can develop applications *themselves*.

IDMS/R is also extremely flexible. It anticipates change by providing for the dynamic definition and redefinition of your relational database.

Finally, a point of special interest to 4300 users: IDMS/R conserves finite data processing resources. With a feature called "Relational Fastpath," you can tune the database and thereby benefit from a dramatic boost in performance.

For more information about IDMS/R, as well as our complete approach to information management, attend a Cullinet Seminar. You can make arrangements by calling, toll-free, 1-800-225-9930. In MA, the number is 617-329-7700.

The Complete Software Solution

Cullinet: I'd like to learn more about IDMS/R.
Please arrange for me to attend a Cullinet Seminar.

MEASURE

from page 33

source code worked relatively well. In those days, when assembler languages were the only ones available, the phrase "a line of source code" had a fairly clear definition: It was in fact a single source code statement, and it occupied a single line on a coding sheet.

However, with the arrival of Cobol, Fortran and the other compiler-based languages, a set of major problems arose that caused ambiguity about lines of source code.

While the unit of measure "lines of source code" continued to be the standard measure of productivity, it no longer had a precise definition, and the same program could vary by more than 10:1 in apparent size simply by changing the rules of line counting.

The real problem

Ambiguities in line counting are only a superficial problem and could be resolved by adopting standards. However, there is a much more serious problem with benchmarks based on lines of source code than a simple lack of standard definitions. The real problem is that such a benchmark does not work across different source languages and indeed penalizes high-level languages in direct proportion to the level of the language.

The reason for the penalty is analogous to a classic industrial phenomenon: If a manufacturing process has a high percentage of fixed costs and there is a decline in the number of units produced, then the cost per unit goes up. In software development, there are a great many activities that are not exactly fixed costs, but are not directly related to coding either: requirements, design, user documentation and so forth.

For example, assume that two identical programs are to be written — one in assembler language and the second in Pascal (see Figure 1).

Paradox occurs

Note the paradox that occurs: While the high-level language reduced the total development effort by 50% and improved true economic productivity by 50%, if productivity is measured in terms of lines of source code per month, then the improvement disappears, and the assembler language version looks twice as productive.

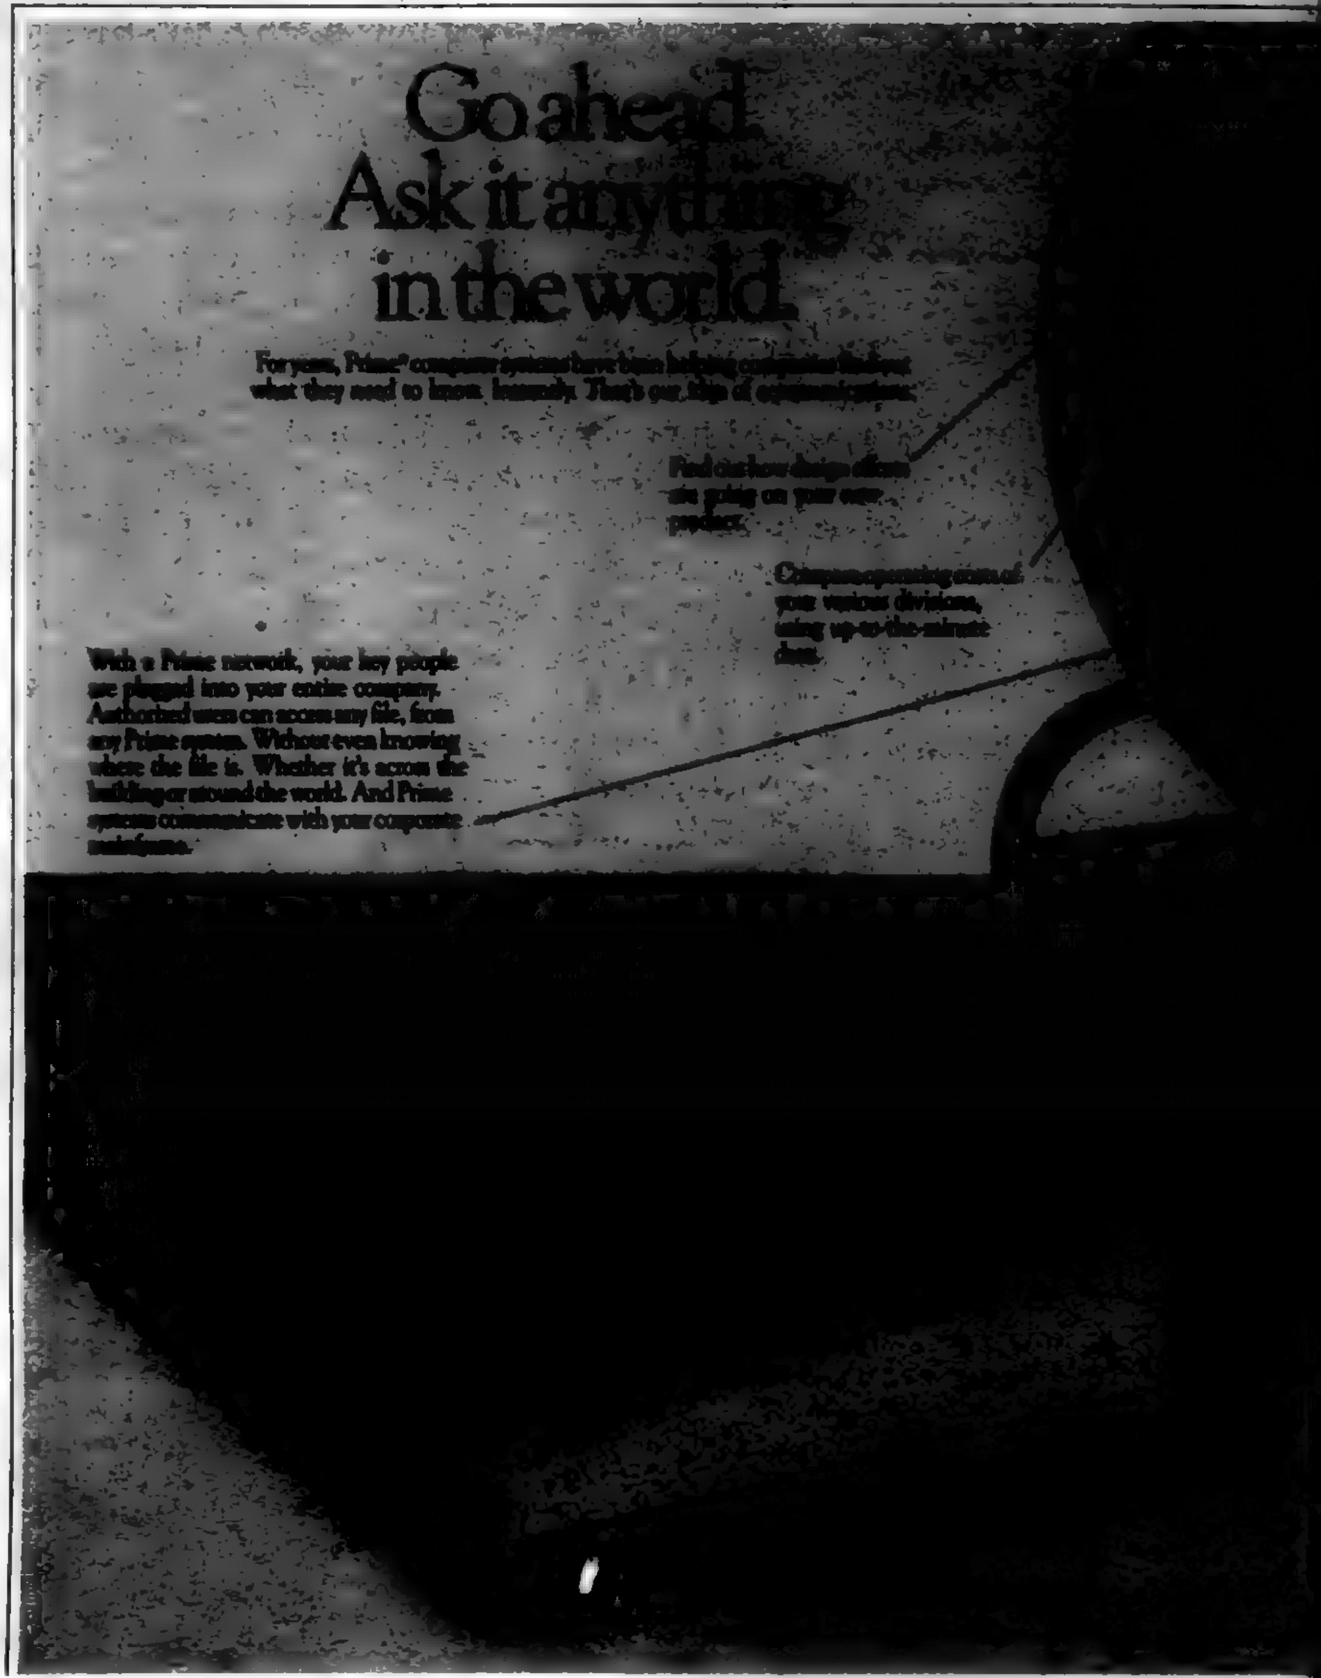
In the late 1970s, Allen Albrecht of IBM had to confront this productivity paradox. As a manager within IBM's Data Processing Services group, he was looking for a way to measure productivity that would work across multiple languages: assembler, Cobol, RPG, IBM's DMS/VS and many others.

What he came up with has come to be called "function points," the weighted sum of five major external attributes of a software program (see Figure 2).

There are some other attributes of the function point method that deal with adjustments for complexity, but they are not needed to understand the fundamental concept. Essentially, function points are like the Dow Jones market indicators — a composite number that can indicate useful trends.

Look at the previous assembler and Pascal examples in terms of function points. For both versions, the function point total will be the same. In this case, assume one of everything (see Figure 3).

Considering the previous assembler and Pascal examples, the 100 months it took for the assembler lan-



For years, Prime® computer systems have been helping companies find out what they need to know. Instantly. That's our kind of communications.

Find out how design efforts are going on your new product.

Compare operating costs of your various divisions, using up-to-the-minute data.

With a Prime network, your key people are plugged into your entire company. Authorized users can access any file, from any Prime system. Without even knowing where the file is. Whether it's across the building or around the world. And Prime systems communicate with your corporate mainframe.

guage version can now be expressed as 0.3 function points per month. The 50 months it took to do the Pascal version yields a function point rate of 0.6 function points per month, or twice the function point rating of assembler.

For the first time in the history of computing, software productivity has a benchmark that reflects economic productivity without the mathematical paradoxes associated with measurements based on lines of source code.

Reason for significance

This is the reason why the function point method is becoming so significant: It can show the value of high-level languages in a way that is relatively free from distortion.

Not only can the function point method demonstrate the value of high-level languages, it can be used to predict the size of a program as well, in any language. For example, the approximate number of source code statements per function point for a few common languages are shown in Figure 4.

Although the current margin of error of the source code-to-function-point ratio is high, even the possibility of an accurate measure that can be used early in development is a very exciting occurrence.

The function point method is still evolving. Not only that, but the function point method has its own sources of ambiguity, and the exact definition of some of its terms, such as "inputs" and "outputs," has required a great deal of effort. Even so, the potential value of the method makes it worthy of serious exploration.

SYSTEMS from page 34

VIRTUAL MICROSYSTEMS, INC.

Bridge enhancement

Virtual Microsystems, Inc. has announced that its Bridge development system now permits Intel Corp. development languages to run on Digital Equipment Corp. VAX-11 computers.

By using the Bridge, users reportedly can compile and run Intel PL/M-86 programs from any terminal attached to a VAX-11 or other DEC minicomputer system. The program is said to allow user to work at exiting terminals and exchange programs and data via the DEC VMS operating system utilities.

Price per system is $9,900.

Virtual Microsystems, Suite 200, 2150 Shattuck Ave., Berkeley, Calif. 94704.

BUSINESS COMPUTER DESIGN, INC.

Telex-Mint

Business Computer Design, Inc. has announced a software package that reportedly gives telex processing capabilities to IBM System/34, 36 and 38 minicomputers.

The Telex-Mint communications package reportedly allows users to create telexes, cables and mailgrams from any workstation using full on-line text editing. Communications characters are said to be generated by Telex-Mint and carried over the ITT Databridge communications network. According to the company, users can send to any telex acceptance machine at rates of 2,400 bit/sec to 4,800 bit/sec with an AT&T-compatible modem.

The introductory fee for the Telex-Mint system is $1,950 for the System/34 and System/36 and $2,850 for the System/38.

Business Computer Design, 9000 Jorie Blvd., Oak Brook, Ill. 60521.

MT XINU, INC.

Enhanced 4.2BSD

Mt Xinu, Inc. has released source code software for the University of California at Berkeley 4.2 version of the Unix operating system, 4.2BSD, that adds a debugger, performance enhancements, utilities and device support. Dubbed Enhanced 4.2BSD, the system runs on Digital Equipment Corp.'s VAX-11 computers and

Continued on page 38

SOFTWARE & SERVICES

Continued from page 37

various 32-bit microcomputers, including systems developed by Sun Microsystems, Inc. and Masscomp Co.

The company offers ongoing source maintenance and binary redistribution rights to purchasers of its Enhanced 4.2BSD source software.

The price of the Enhanced 4.2BSD system is $10,000.

Mt Xinu, 739 Allston Way, Berkeley, Calif. 94710.

PRECISION VISUALS, INC.

HP 7550 device driver

Precision Visuals, Inc. has announced a device driver coded in Fortran that permits users of the device-independent Precision Visuals DI-3000 and GK-2000 graphics tools packages to utilize the Hewlett-Packard Co. HP 7550 plotter.

Capabilities supported by the driver include 40 character fonts, nine markers, 14 line styles and the plotter's automatic paper load feature. To access the hardware functions of the HP 7550, the driver converts all DI-3000 or GK-2000 subroutine calls into the appropriate HP graphics language commands.

The HP 7550 device driver is priced at $500 and includes documentation and source code.

Precision Visuals, 6260 Lookout Road, Boulder, Colo. 80301.

STAFF COMPUTER TECHNOLOGY CORP.

The Key

Staff Computer Technology Corp. has introduced The Key, an access control and software security system that reportedly operates on any computer equipped with an RS-232 interface.

The Key achieves access control by using different inquiry/response pairs each time a terminal user requests access. The mainframe contains the master key, and each terminal requiring controlled access contains unit keys.

Software suppliers attain security by tailoring demonstration software to a specific key. The Key can be installed on any machine the demonstration works on. Users can copy the diskette and back it up, but the software and copies cannot be used without The Key.

An evaluation unit for access control includes master and unit keys and is priced at $399.

Staff Computer Technology, Suite J, 10457 Roselle St., San Diego, Calif. 92121.

DIGITAL INFORMATION SYSTEMS CORP.

DBL Version 4 on Unix

Digital Information Systems Corp. has announced that its DBL language now runs under AT&T's Unix operating system.

According to the company, Version 4 of DBL offers the ability to chain to non-DBL programs and to interface to subroutines written in other languages. Multikey IBM Isam files, full screen programming functions, a fixed-point decimal data type and a symbolic debugger are included with the system.

DBL Version 4 pricing starts at $449 for micros and ranges up to $3,549 for superminis.

Digital Information Systems, Suite 340, 3336 Bradshaw Road, Sacramento, Calif. 95827.

FOCUS

from page 33

the System/34. Before moving actual production data onto the Personal Computer XT, he ran reports from both machines using test data on the Personal Computer XT and compared the results.

Coursey has done no formal testing of the application. "Most of the data we use is pretty straightforward," he said. "If there's an inconsistency, it really jumps out at you."

Admitting that he has no experience in formal development, Coursey said he basically used the prototyping capabilities of PC/Focus to make changes as he went along. "I have an idea of the ultimate goal, and I work toward it," he said. "The program logic and code probably could be better, but it does what I want."

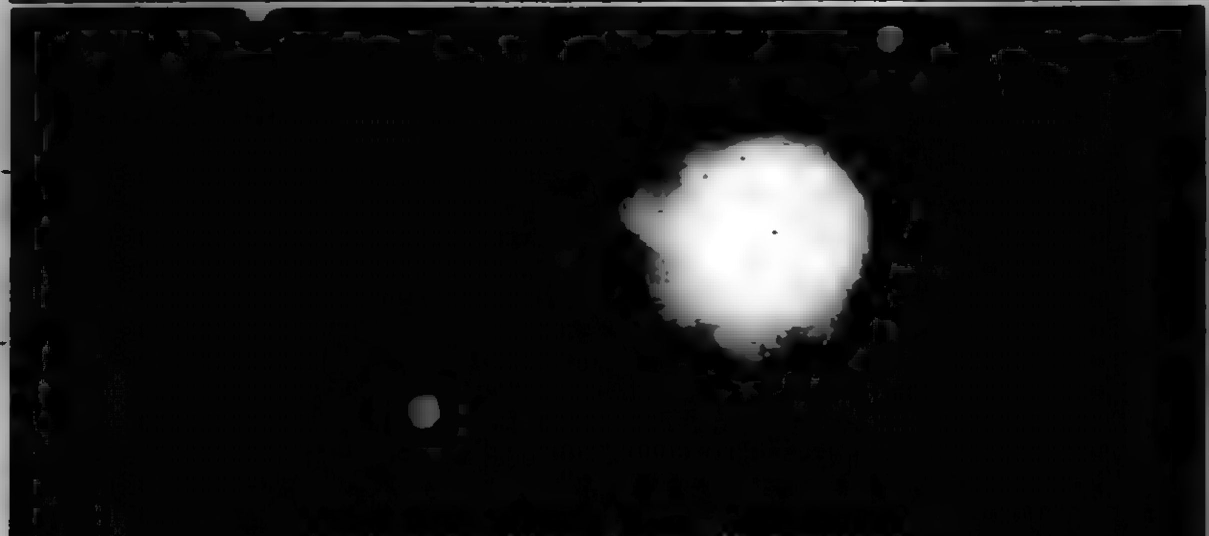
Accommodating changes

A relational data base structure was particularly helpful in accommodating frequent changes, he said. "One of the advantages of the relational data base is that I've made a lot of screwups in designing this," he said. "I've left out fields, and the relational data base has let me rebuild them easily. It grows with you."

The application is almost entirely menu-driven. "The user has no interface directly with PC/Focus," he said. He noted that he has not written any documentation for the program. "The documentation basically consists of turning the machine on," he said. While that does not present a problem as long as he works at Clyde Petroleum, Coursey admitted that "If I were to leave, and modifications needed to be made, it could be a problem. We would need a DP-type to take up where I left off."

Coursey chose PC/Focus from a list of four or five alternatives, including Ashton-Tate's Dbase II and Micro Data Base Systems, Inc.'s MDBS. "There are a lot of data bases, but I don't think [there are] any with as many bells and whistles as PC/Focus," he said. In addition, the product offered upward compatibility with mainframe Focus. "If the company grows by leaps and bounds and we have to transfer the application to the mainframe, we can do it," he said.

Coursey said PC/Focus was "difficult to learn from an end-user standpoint. It will do most of what I want [it] to do, but there are a lot of intermediate steps you have to take in order to make a program operate properly," he said.



Unleash The True Potential
of The 68000/Unix Environment

PHILON FAST/Compilers are so fast, your concept of speed will never be the same. Compilers that unleash the ultimate power of the 68000 and drive UNIX* to its fullest potential. PHILON FAST/Compilers redefine performance in benchmarks — UP TO 47 TIMES FASTER (see benchmark chart).

FLEXIBILITY — It's built in. PHILON FAST/Compilers are specifically designed to free programmers from artificial constraints (such as 64K program size or data file limitations) and allow efficient development of highly-optimized application systems. You can even link program modules in the same or different languages.

DEBUGGING — It's a snap. The Phi-Analyzer high-powered debugger vastly increases programming productivity.

THOROUGH TESTING — RESPONSIVE SUPPORT

You demand reliable compilers; Philon's quality assurance commitment delivers.

ACCURATE, EASY-TO-UNDERSTAND DOCUMENTATION — it's part of The Philon Approach.™ Plus, you can become part of a comprehensive customer support program designed to keep productivity at its maximum. This is what you will come to expect from Philon.

RECOMPILE EXISTING APPLICATIONS FOR DRAMATIC RESULTS

Dramatic speed improvements can be achieved by simply recompiling with one of these corresponding PHILON FAST/Compilers.

RM/COBOL** .... PHILON FAST/COBOL
CBASIC† .... PHILON FAST/BASIC-C

COMMUNICATIONS

DATA STREAM
John Dix
CW Senior Editor

T1 users may elude 'leaky' PBX charge

Users of digital T1 communications facilities may be sidestepping the $25 surcharge now being levied on private-line facilities by local telephone companies.

This surcharge went into effect last month and is meant to compensate local telephone companies for the so-called "leaky" private branch exchange (PBX) problem. A PBX is considered to be leaky when it is tied to a remote PBX or telephone company central office with a leased line, circumventing local dial-up circuits and their associated customer access line charge.

The $25 surcharge is being applied to all private lines unless the user can prove that the circuit qualifies for exemption. Exemption is granted for circuits that are terminated by devices that are incapable of rerouting traffic into the telephone network. Generally, this means that point-to-point leased facilities that are used in data applications will not carry a surcharge, whereas the same line used to tie together remote PBXs will be subject to the charge.

While it is a relatively easy matter for telephone companies to verify circuits that should carry the surcharge, it will be more difficult for the local exchange carriers to police T1 carrier use. These digital facilities operate at 1.54M bit/sec and can be subdivided into a number of individual subchannels, typically 24 channels operating at 64K bit/sec.

Because the link is digital, data and digitized voice can be accommodated with equal ease. The data circuits, however, won't normally be subject to the $25 surcharge, and the voice circuits will, creating a potentially unmanageable situation. As one user quipped at a recent conference while discussing the digitized voice channels on a T1 link, "those aren't voice channels, they're 64K bit/sec data channels."

With the onus on the user to apply for surcharge exemption, most companies are

See CIRCUIT page 42

Interface extends boundaries of insurer's electronic mail

FORT WAYNE, Ind. — Electronic mail users at an insurance company here are now able to send messages outside of the company using an interface that is modeled after a developing standard.

Lincoln National Corp. tailored the interface for its private electronic mail network after MCI Mail Link, a specification developed by MCI Digital Information Services Corp. The insurance company has been using the interface specification — which was officially unveiled this month — since June, according to James Tunis, telecommunications director. Licensing rights for the interface will become commercially available on a license basis in April.

The specification is a forerunner of an electronic message network interface standard, known as X.400, now under development.

"It will be at least a couple of years, however, before the final version of X.400 is implemented by vendors of electronic mail systems," explained Bob Harcharik, president of the MCI Communications Corp. subsidiary. The Mail Link specification, he added, provides a way for private networks to communicate with each other during the interim.

Lincoln National is one of two beta test sites for the MCI Mail Link specification. The other is Citibank, N.A., in New York. In each case, the interface connects in-house users with MCI Mail, the international public electronic mail network operated by Harcharik's organization. MCI Mail, in turn, provides access to other private and public message networks, to TWX/telex terminals and to laser-driven printers that output hard-copy messages for delivery to those without terminals.

Without the interface it's technically possible for users to communicate with the outside world through MCI Mail. But setting up and terminating the call is cumbersome.

Without the new interface, explains Tunis, it's technically possible for users to communicate with the outside world through MCI Mail. But setting up and terminating the call is cumbersome, requiring special logon and logoff procedures. Also, the user generally is unable to get an acknowledgement that his message was received.

See MAIL page 42

International Zapmail agreement awaiting FCC stamp of approval

MEMPHIS — Fedex International Transmission Corp., a subsidiary of Federal Express Corp., has applied to the Federal Communications Commission for authority to provide international document transmission between the U.S. and Belgium and the U.S. and England.

A company spokesman said the applications include agreements with the communications governing bodies in Belgium and England to extend Federal Express' Zapmail service into those countries beginning in the spring of 1985.

The spokesman said that because of the time zone differences between the two continents, the international service would be a next-day service from the U.S. to Europe and a same-day service from Europe to the U.S., rather than the two-hour delivery that Zapmail promises for domestic document transmissions.

AT&T to launch 21,000-mile cable project

BASKING RIDGE, N.J. — AT&T Communications recently announced plans to construct a lightwave communications backbone to interconnect most major U.S. cities and to traverse the Atlantic and Pacific oceans by 1990. In addition, the company said, it plans to expand its digital microwave radio network and convert 4,500 miles of its coaxial network to digital transmission.

A company spokesman said the project to add 21,000 miles of fiber-optic cable is made possible by the improved cost-effectiveness of the technology. He noted that while fiber-optic regenerators were once necessary every few miles, they can now be spaced 24 miles apart.

"AT&T will construct the world's largest fiber-optic telecommunications network by the end of this decade," said Robert W. Kleinert, president and chief operating officer of AT&T Communications.

AT&T said it will use single-mode lightwave systems on all new routes, and that by 1988 the systems will operate at 1.7G bit/sec and transmit up to 169,344 simultaneous conversations.

The lightwave systems will provide voice, data and video transmission between AT&T digital switching machines in major cities. The company already has lightwave systems connecting Boston to Washington, D.C. and San Francisco to Bakersfield, Calif. Other cities will be added to the network in phases through 1989.

The company said that by 1988 it will have installed the majority of the first transoceanic lightwave system. This project, known as the TAT-8 system, will link Tuckerton, N.J. with Widemouth, England, and Penmarch, France. AT&T said it plans to connect California with the western Pacific via Hawaii and Guam by late 1988 or early 1989.

Satellite net to relay financial information

NEW YORK — E.F. Hutton & Co. and Equatorial Communications Co. have announced an agreement for a private satellite-based communications network to be used to transmit customer account information and real-time securities information among 400 E.F. Hutton offices in the U.S.

The system, utilizing a 9.6K bit/sec satellite channel, will also allow E.F. Hutton to download software on a point-to-multipoint basis to its offices, which will be equipped with Data General Corp. MV4000 minicomputers.

Equatorial will supply the earth stations and services for the hybrid satellite/terrestrial net.

E.F. Hutton is located at 1 Battery Park Plaza, New York, N.Y. 10004; and Equatorial Communications is at 300 Ferguson Drive, Mountain View, Calif. 94040.

VOICE/DATA COMMUNICATIONS

MANUFACTURING TECHNOLOGIES, INC.
Matchmaker 2000

Manufacturing Technologies, Inc. has introduced a link enabling IBM 3270 terminal users to access non-IBM hosts, local-area networks and public data networks.

Matchmaker 2000 is said to allow users to toggle back and forth between IBM and non-IBM sessions. It reportedly allows access to minicomputers and mainframes such as those from Digital Equipment Corp., Data General Corp. and Hewlett-Packard Co. and a variety of micros, private branch exchanges, public packet-switching networks, information services and electronic mail services.

The product is installed between the user's IBM 3178, 3179, 3180, 3278 or 3279 terminal and the IBM 3274 or 3276 cluster controller. The Ascii device can be connected directly with an RS-232C interface or through a modem, according to the vendor. It reportedly supports either 7- or 8-bit Ascii character modes at speeds up to 19.2K bit/sec.

It is based on an Intel Corp. control microprocessor with structured control programs and table-driven software for interface flexibility, according to Manufacturing Technologies.

Matchmaker 2000 costs $695.

Manufacturing Technologies, 6481 Global Drive, Cypress, Calif. 90630.

PROTOCOL CONVERTERS

THOMAS ENGINEERING CO.
Protocol Control Unit

Thomas Engineering Co. has announced an enhanced model of its MZ-80 MIU protocol converter.

The Protocol Control Unit reportedly gives asynchronous terminals access to IBM Bisynchronous and Systems Network Architecture/Synchronous Data Link Control (SNA/SDLC) nets, Honeywell, Inc. Visual Information Projection (VIP) nets and X.25 packet-switched nets.

It was designed to give a terminal access to all four environments and is said to support up to 60 asynchronous terminals and four hosts. The basic unit supports eight terminals.

The unit has a facility for file transfer, modem and printer sharing and access to dial-up modems and serial devices such as cash registers and energy management controllers, according to the vendor. The modular units with bisynchronous and VIP support will be available in January 1985, the SNA/SDLC support in the second quarter of 1985 and the X.25 support in the third quarter of 1985.

Prices start at $5,995 for the eight I/O port model. Host ports cost $750 each, except for SNA/SDLC, which costs $1,100.

Thomas Engineering, 2440 Stanwell Drive, Concord, Calif. 94520.

SOFTWARE

COMPUTIMES, INC.
Communications software package

Computimes, Inc. has announced a data collection and communications software product for use on IBM mainframes serving intelligent terminals such as retail point-of-sale and banking terminals.

The software, which is unnamed, is said to provide off-line polling of terminals to collect data for batch processing and to provide downloading of price changes and other information to the terminals.

The number of lines served is limited only by the host's physical limits. The product's modular design reportedly allows access to varied communications devices and use of various standard protocols.

It runs on IBM 4300 series, 370 series and 30 series mainframes under DOS/VSE and OS/MVS.

The basic version costs $65,000; additional modules that provide extra protocols and access to additional devices cost about $25,000 each.

Computimes, 401 N. 117th St., Omaha, Neb. 68154.

MULTIPLEXERS/ MODEMS

ASTROCOM CORP.
SH56S

Astrocom Corp. has introduced its SH56S modem, designed to transmit synchronous data at 28K bit/sec or 56K bit/sec over twisted-pair lines.

At the lower speed, the SH56S is said to be effective over distances up to 3 miles and 2¼ miles at 56K bit/sec. It reportedly can be configured for point-to-point or multipoint operation, is available in a stand-alone or nested circuit card design, has switch-selectable speeds and features an optional V.25 interface.

With an RS-232 interface, the stand-alone costs $730, and the circuit card costs $540. With the V.25 interface, it costs $822 as a stand-alone and [illegible] as a circuit card.

Astrocom, 120 W. Plato Blvd., St. Paul, Minn. [illegible]

MICOM SYSTEMS, INC.
Micro[illegible] Data Modem Model 40144

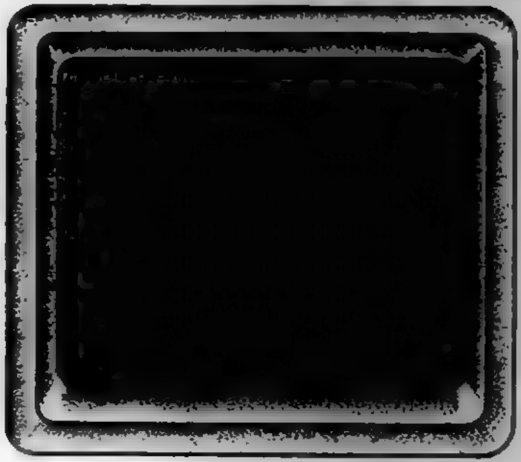
Micom Systems, Inc. has announced what it said is its fastest full-duplex, leased-line modem.

The Micro[illegible] Data Modem Model 40144 normally operates at 14.4K bit/sec, but is said to accelerate to 16.8K bit/sec in the absence of line noise.

This capability reportedly increases throughput, particularly on

The people who gave you INTELLECT introduce a new software product. And an incredible introductory price.

New INTELLECT/SX.



$30,000

if you order by December 31, 1984.

New INTELLECT/SX lets users define and maintain their own data.

Since its introduction, INTELLECT has provided hundreds of organizations with a new way of doing business. It makes data more useful by making it available to anyone who can ask a question in plain English . . . even the hopelessly technophobic.

Now there's new INTELLECT/SX. It enables non-technical users to define and maintain their own personal databases. It allows users to access existing sequential files, or to create their own. And INTELLECT/SX has an Interactive Lexicon that users can build and enhance in everyday English—so INTELLECT/SX is as easy to install as it is to use.

With INTELLECT/SX, users can get their own data and make decisions faster. Data processing and Information Center professionals are free to spend their time on their own productive tasks rather than chasing down data for others.

And between now and December 31, 1984, we're offering new INTELLECT/SX at a special introductory price of just $30,000.

New INTELLECT/FOCUS gets everyone in your organization into FOCUS.*

Until now, FOCUS has been a powerful productivity tool for Information Center and data processing professionals. But now there's a way for everyone in your organization to get the bene-

links supporting multiplexers or remote job-entry stations. The increase from 14.4K bit/sec to 16.8K bit/sec is automatic under optimal line conditions, and the speed can fall back automatically to 12K bit/sec or 9.6K bit/sec if line quality deteriorates below AT&T D1 conditioning standards. The modem costs $6,495.

Micom Systems, 20151 Nordhoff St., Chatsworth, Calif. 91311.

U.S. ROBOTICS, INC.
Modems and software

Modem manufacturer U.S. Robotics, Inc. has introduced two 2,400 bit/sec modems, the stand-alone Courier 2400 and integral Microlink 2400 for use in the IBM Personal Computer and compatibles.

The units reportedly provide dial-up, asynchronous communications and feature autodial and autoanswer, CCITT V.22 compatibility at 2,400 bit/sec, and compatibility with AT&T 212A at 1,200 bit/sec and AT&T 103 at 300 bit/sec.

Other features include call duration reporting, display of current settings for communications parameters and other operational controls, Help screens, repeat command, quote mode and call progress detection.

Each modem costs $895.

The company also announced Telpac 3.0, an enhanced version of its telecommunications package for the IBM Personal Computer and compatibles designed to work with U.S. Robotics and compatible modems. The package features windows to guide users through commands and costs $99.

U.S. Robotics, 1123 W. Washington Blvd., Chicago, Ill. 60607.

NETWORK SERVICES

SATELLITE BROADCAST NETWORK, INC.
Satellite receiver system

Satellite Broadcast Network, Inc. has announced a satellite service for personal computer users.

Users can purchase a 12-GHz compact satellite receive-only antenna, an amplifier, a solid-state receiver and a demodulator to access the service, which is available to users of the IBM Personal Computer and compatibles.

The company said that services will include financial data, news, weather, sports, software downloading and specialized information such as agricultural, scientific and medical data. The information services will be provided by various vendors.

The hardware for the 9.6K bit/sec service costs $960.

Satellite Broadcast Network, 30 E. Huron, Chicago, Ill. 60611.

AUXILIARY EQUIPMENT

LIGHTWAVE COMMUNICATIONS, INC.
FO-232E

Lightwave Communications, Inc. has announced the third product in its series of RS-232C fiber-optic data links.

The FO-232E was designed to transmit data asynchronously via plastic cable at distances up to 250 feet. It is intended to enable end users to interconnect terminals, printers and other peripherals to computer equipment at speeds up to 19.2K bit/sec and is compatible with existing RS-232C 25-pin connectors, according to the company.

It costs $90.

Lightwave Communications, 650 Danbury Road, Ridgefield, Conn. 06877.

KURZWEIL COMPUTER PRODUCTS, INC.
Penta Custom Interface

Kurzweil Computer Products, Inc. has announced a custom interface that is said to link its Kurzweil 4000 Intelligent Scanning systems and Penta Systems International, Inc.'s typesetting systems.

The Penta Custom Interface is said to insert Penta-specified composition commands automatically into the scanned text during the communications process from the Kurzweil 4000 to a Penta front-end system. It was designed to eliminate the need for inserting additional typesetting commands prior to phototypesetting.

Available now on 8-in. floppy disks, it costs $5,500.

Kurzweil Computer Products, 185 [redacted]

DIGITAL EQUIPMENT CORP.
DHU11; DMZ32

Digital Equipment Corp. has introduced two asynchronous multiplexers to connect serial lines to DEC Unibus-based VAX-11 and PDP-11 computers.

According to the vendor, the DHU11 interfaces up to 16 asynchronous lines between any PDP-11 or VAX-11 computers with an integral Unibus operating under DEC VAX/VMS Version 4.0. The single hex-size circuit card is said to support medium- and high-speed serial communications requirements, connecting through RS-232C or RS-432A interfaces. It features direct

memory access (DMA) and first-in-first-out (Fifo) operations to minimize CPU overhead, according to DEC.

The DMZ32 multiplexer supports up to 24 asynchronous lines to Unibus-based VAX-11 computers. The vendor said the DMZ32 is a high-performance unit that can interface a variety of terminals to a VAX-11 system, allowing a terminal distribution panel to be located up to 5,000 feet from the Unibus connection. It also features RS-232C connectors and DMA and Fifo operation.

Both controllers provide half- or full-duplex communications, according to DEC.

The price of the DHU11 begins at $3,120, and the price of the DMZ32 begins at $3,215.

DEC, Maynard, Mass. 01754.

DIGITAL PRODUCTS, INC.
Digital Current Loop Switches

Digital Products, Inc. has announced a series of switches that allow Teletype and compatible equipment to communicate with any RS-232 device.

Digital Current Loop Switches reportedly allow Teletypes, early Digital Equipment Corp. equipment such as PDP-11 computers and LA 120 terminals, high-speed printing terminals and CRTs to be combined with computers and modems in a common system.

They are said to accommodate up to 9,600 bit/sec transmissions and to allow grouping to connect an unlimited number of devices.

They are priced from $395.

Digital Products, 600 Pleasant St., Watertown, Mass. 02172.

ALCYON CORP.
I/O processor

Alcyon Corp. has announced an intelligent I/O processor designed for Motorola, Inc. 68000 and AT&T Unix-based systems.

Each of the 16 full-duplex asynchronous serial data channels of the device can support data bursts up to 9.6K bit/sec from a 68000 processor. Synchronous data rates up to 1.5M bit/sec are possible on each of two programmable, on-board full-duplex channels. It includes a four-channel direct-memory access controller and buffer memory and occupies a dual-width Digital Equipment Corp. Q-bus circuit board. It costs $2,345. An eight-channel option costs $950 and a 16-channel multiplexer is $1,555.

Alcyon, 8716 Production Ave., San Diego, Calif. 92121.

Our multi-mode printers accelerate from 100 cps to 480 cps and have an impressive finish everytime.

In the Grand Prix of office automation, HERMES multi-mode printers always come in first. Both 400/480 cps data and 100/120 cps single pass near letter quality are possible with the same print-head.

Speed and quality have never been as successfully combined. Professionals who want only the best will also appreciate:

Their versatility. Wide range of attractive characters sets in 16 national versions, as well as math symbols, bar codes and teletex. Dual ports, parallel (CENTRONICS™/EPSON™ compatible) and serial (RS-232C/RS-422) interfaces. DIABLO™ 630 emulation optional.

Their resolution. Finest print quality available on matrix printers. So good you can even print signatures. Bit mapping graphics in single and double density modes, 6 dots densities in each mode. A circle on the screen means a circle on the paper too!

Their quality. Swiss high quality construction. Quality that lasts - thanks to their exclusive «moving-ruby» head.

Their multicolored printing. Text and graphics printing in 8 colors on both models 615 and PC-Printer 2.

HERMES®
The impressive printers

Manufactured in Switzerland by HERMES PRECISA INTERNATIONAL, CH-1401 Yverdon.

HERMES printers are distributed in Austria, Canada, Cyprus, Finland, France, Greece, Jordan, Kuwait, Lebanon, Saudi Arabia, South Africa, Spain, Sweden, Switzerland, United Kingdom, USA, West Germany.

To receive a sample of the finest quality matrix print-out and additional information on the HERMES printers, please return the coupon below.

Please send me more documentation about your HERMES printers.

MAIL from page 39

"Our new interface eliminates these problems. It establishes and terminates the connection automatically between our network and the MCI Mail network. Their system then takes care of the other end. And we get an acknowledgement — when the message is received by the MCI Mail network as well as when it's delivered in hard-copy form to the recipient," Tunis said.

The interface also permits a delivery confirmation to be returned to the sender from any terminal connected to the MCI Mail network.

Tunis said it is still too early to detect a change in the outside message traffic flowing through Lincoln National's in-house network, largely because the company hasn't made a special effort to tell users about the interface.

The present version is being upgraded to conform with the version MCI announced this week. Tunis expects the upgrade to become operational within a few months. He believes that during the succeeding year or two, outside message traffic sent and delivered through the company's electronic mail network will increase gradually.

A prospective added benefit, Tunis said, is the ability to correspond with clients and suppliers on-line. Lincoln National communicates regularly, for example, with reinsurance companies that broker the company's policies and with organizations that have purchased group insurance coverage. Now, the postal service carries this correspondence.

A systems analyst and a programmer needed about two man-months to develop the present interface, Tunis said, and he estimates that implementing the upgrade will require approximately one more month. The only other cost — amounting to about $600 — was for an error-checking modem to connect Lincoln National's in-house network with the MCI Mail network.

CIRCUIT from page 39

expected to be upright about T1 use, but a spokesman for the Federal Communications Commission admitted that there will be "definite problems" monitoring its use.

These problems will be exacerbated as T1 use becomes more prevalent. The appeal is usually a simple, economic one. As an example, a user that wished to remain anonymous reported that he is saving more than $5,000/mo by replacing individual leased lines with a single T1 facility.

He replaced 20 tie lines connecting two PBXs and 11 individual 9.6K bit/sec leased lines for data communications with the T1 link. With a T1 multiplexer, the 1.54M bit/sec bandwidth of the T1 facility was divided into 20 32K bit/sec voice tie lines, one 19.2K bit/sec data channel, 10 9.6K bit/sec synchronous channels and four 9.6K bit/sec asychronous channels. Additionally, the user reported there is approximately 700K bit/sec of spare capacity on the link.

Before the T1 was cut over, the total cost of this user's voice and data lines, plus the necessary modem and multiplexing hardware, was nearly $9,500/mo. With the T1 link and the necessary multiplexing hardware his monthly bills dropped to roughly $3,800/mo.

INTRODUCING THE STANDARD BY WHICH EVERY OTHER PC WILL BE MEASURED:

THE DATA GENERAL/One™ PORTABLE.

Fits in a briefcase.

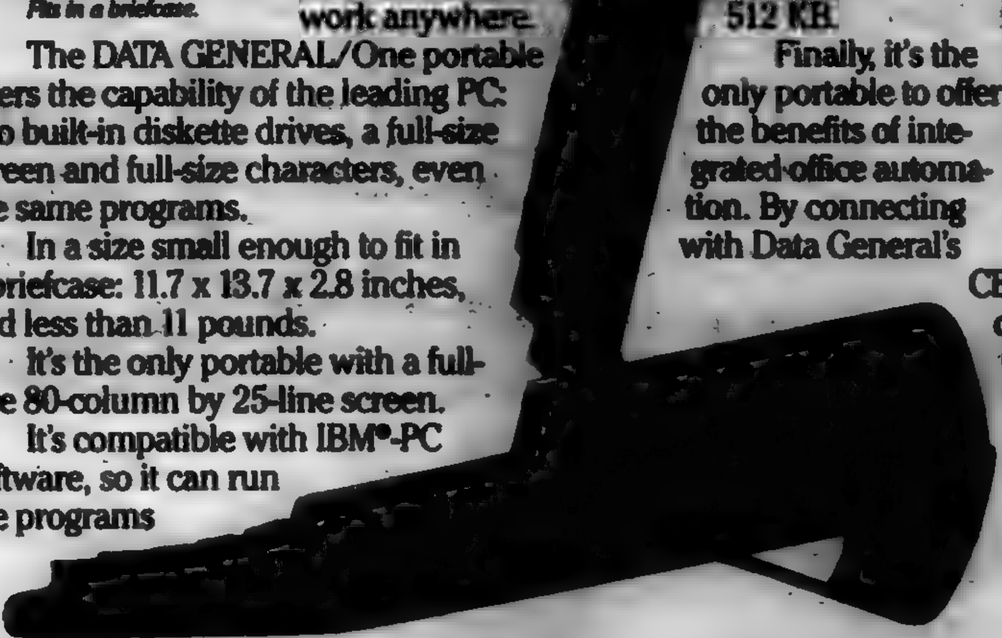
Free your people from the confinement of their deskbound computers, with the first full-function business system that lets them work anywhere.

The DATA GENERAL/One portable offers the capability of the leading PC: two built-in diskette drives, a full-size screen and full-size characters, even the same programs.

In a size small enough to fit in a briefcase: 11.7 x 13.7 x 2.8 inches, and less than 11 pounds.

It's the only portable with a full-size 80-column by 25-line screen.

It's compatible with IBM®-PC software, so it can run the programs available to PC users. Software like 1-2-3™ and Symphony™ from Lotus,™ Wordstar,® dBase II,® Multiplan,® even engineering packages like Golden Common LISP™, and Bellesoft ES/P™-Ada®.



It has two built-in diskette drives and runs thousands of IBM-PC programs.

It's the only portable with two built-in 720 KB diskette drives, giving it twice the storage capacity of the leading PC. And memory is expandable up to 512 KB.

Finally, it's the only portable to offer the benefits of integrated office automation. By connecting with Data General's CEO® system, users can convert MS™-DOS files to CEO files and vice versa.

Connects with Data General's CEO office automation system.

The DATA GENERAL/One. It gives your people what the leading PC does. And something the leading PC doesn't.

Their freedom.

Find out more about the DATA GENERAL/One portable by contacting your Data General salesperson or nearest authorized dealer.

Call 1-800-DATAGEN.

THE ITT 9236.
IT HAS THE FUNCTIONS YOU WANT TODAY, THE FLEXIBILITY YOU'LL NEED TOMORROW.

When it comes to extended functions, our new 9236 display has everything.

For instance, it gives you dual logical units that let you change applications with a single keystroke.

It has selectable screen formats so you can use one display to handle more than one application.

It can use a light pen or operate a display-attached printer so you can make local copies at your workstation.

It offers the ergonomic benefits of a non-glare matte finish. A compact, low-profile keyboard. And a flicker-free, high-resolution, 14-inch screen that tilts and swivels.

On top of all this, our 9236 gives you extended data stream and programmed symbols for color graphics. Plus a long list of exclusive ITT productivity features, like automated keystrokes, built-in notepad, dynamic color assignment, and auto log off/power off.

But perhaps the most important thing we've built into our 9236 is a flexible, open architecture. The kind of architecture that'll take you into networking, the electronic office, or wherever else you want to grow.

Of course it wasn't easy designing in all this and keeping the 9236's price competitive, too.

But, then again, giving you more display for your money has always been what ITT Courier is all about.

For more information, contact your nearest ITT Courier Representative. Or call the ITT Courier Sales Support Dept. at 1-800-528-1400, toll-free.

Can DEC software offerings live up to 8600's promise?

By announcing its most powerful CPU, the VAX 8600, Digital Equipment Corp. has caught up in hardware technology to competing supermini vendors Prime Computer, Inc. and Data General Corp. and even positioned itself well against small IBM mainframes in price/performance terms.

But several analysts interviewed by *Computerworld* question whether DEC's software can equal the power of its hardware.

Prime's 9950 and DG's MV/10000 high-end machines, each boasting performance ratings of 2.6 million instructions per second (Mips) [CW, Aug. 20] are more powerful than the machine that was formerly DEC's biggest box, the VAX-11/782, which has a Mips rating of 1.2. But the 8600 comes in with a Mips rating estimated at 4.4, just below IBM's recently announced 4381 Model Group 3.

"DEC has regained the leadership position it needed to maintain credibility in the industry," said Hank Janson of International Data Corp. (IDC), a market research and consulting firm based in Framingham, Mass. IDC analyst Dave Moschella said, "This system allows DEC to meet the demands of customers who may have been attracted to IBM," at a price considerably less than comparable IBM mainframes.

Frederic Withington, vice-president of information systems for Arthur D. Little, Inc. of Cambridge, Mass., said, "The 8600 makes a major change in DEC's competitive position. There is an outside chance DEC may get into [the manufacturing] machine rooms of large companies that are now primarily IBM." But, he qualified, "The 8600 hardware is good for this, but I'm not sure the software is powerful enough. The big, heavy-duty system programs like CICS I'm not sure DEC can match. Without them, DEC can't play."

Stephen Smith, security analyst with Paine Webber, Inc., does not believe the 8600 will allow penetration of IBM's market so much as it will make DEC more attractive to new users and existing users who may have been contemplating switching to IBM for more power. "I think the top-cover is significant," Smith said. "In the past, when the end user felt he needed a bigger machine, the only way to go was IBM because DEC offered less than 2 Mips. Now, [DEC] can offer their customers a greater range of performance. So I do think it helps their position in relation to IBM, but I don't think it's an attack on the IBM data center."

Like Withington, Smith said, "The real issue is software development." Smith likes version 4.0 of VMS for its clustering

Amdahl enhances 6880

Doubles channel, memory capacity; lowers fees

SUNNYVALE, Calif. — Amdahl Corp. last week doubled the channel and cache memory capacity of its 6880 disk control unit. At the same time, Amdahl cut the purchase price of the cache memory feature by as much as 52%. The company also lowered maintenance charges on all models of the 6880 by 20% to 25%.

The cache controller feature is said to boost CPU performance by storing frequently used data in cache memory, the company said. The 6880 is now available with 8M-, 16M-, 24M- or 32M bytes of cache memory. Previously, the maximum cache capacity was 16M bytes. A spokeswoman said the expanded memory will be accomplished with 256K-bit memory chips.

The 6880 can now support up to 16 channels, twice the previously available capacity. The spokeswoman noted that Amdahl has also added to the 6880 support for IBM's VM operating system using IBM's High Performance Option.

Purchase prices for the 6880 range from $119,970 to $315,480, depending on the memory configuration. Corresponding maintenance charges now range from $684/mo to $1,004/mo, according to the firm.

A sample configuration consisting of a 6880 G2 controller with 16M bytes of cache memory, one Amdahl 6380 AA4 string controller and three 6380 B4 disk drives costs $294,600. The same configuration used to cost $427,500; a spokeswoman noted that the lower price also reflects an earlier price cut on disk drives. Maintenance on the configuration costs $1,730/mo; the old maintenance price was $2,280/mo.

As an example of the cost of cache memory field upgrades, Amdahl said a user of a 6880 with a 16M-byte cache controller feature would have to pay $40,000 to upgrade the unit to accommodate 24M bytes of cache memory. Likewise, it would cost $80,000 to upgrade a 6880 with a 16M-byte cache controller feature to a 32M-byte configuration.

Amdahl is located at 1250 E. Arques Ave., Sunnyvale, Calif. 94086.

Honeywell announces mini-based hospital record management tool

MINNEAPOLIS — Honeywell, Inc. has announced a medical record management system for hospitals, the Transcription Recording and Chart Tracking System (Tracts), running on the company's DPS 6 line of minicomputers.

The system runs under the company's Gcos 6 MOD 400 software.

The system's medical record software is said to automate transcription, record analysis, record tracking, abstract production and report generation. The company's office automation software includes word/document processing, records processing, calendar and calculator facilities. DP options for Tracts include data base management systems, transaction processing packages and high-level language support. Communications software is available to support the exchange of data between Tracts and hospital billing, statistical and admissions computers, the company said.

The price of a 250-bed hospital configuration including DPS 6/45, four workstations, a printer, 1M byte of memory and two 20M-byte disk drives is $62,000.

More information is available from Honeywell, Honeywell Plaza, Minneapolis, Minn. 55408.

Sytek releases PFX micro security system

MOUNTAIN VIEW, Calif. — Sytek, Inc.'s Data Security Division recently announced the PFX identity authentication system, a security system that uses an automated one-time password technology said to prevent unauthorized access to networked personal computers or multiuser systems.

Sytek said the PFX system includes a Passport, a portable, hand-held device with an LCD that is programmed for each individual user, and an Authentication Server, a Convergent Technologies, Inc. microcomputer that attaches to the host computer or network.

Under the PFX system, users enter a unique numerical password each time they wish to access the system, the firm said. In order to gain entry, the user must have a Passport, a personal identification number (PIN) and an Authentication Server and must respond correctly to a series of prompts.

'Challenge number'

When a user logs on to the system, the Authentication Server issues a seven-digit "challenge number," which appears on the user's computer screen, according to the company. The user enters his own PIN into the Passport and then enters the challenge number as well.

A one-time password (another seven-digit number) appears on the LCD on his Passport. To gain access to the system, the user then types the password into the terminal.

According to the company, the password sequence generated by each Passport is unique: Given the same challenge number, no two Passports will generate the same response.

In addition, no individual Passport responding to the Authentication Server's challenge will give the same response twice, the company said. An individual Passport is said to work only with the PIN for which it has been programmed, the firm said.

A single Authentication Server is said to be able to serve one or two host computers and up to 2,000 users. The PFX system, said to be compatible with most computer equipment, links to systems through one or more RS-232 serial ports.

The Passport is said to give users access from any terminal. According to the company, the device is virtually tamperproof because its microprocessor will erase itself if the device is taken apart.

The system's Authentication Server is said to

See SYTEK page 54

TURNKEY SYSTEMS

REDSHAW, INC.
Series/2

Redshaw, Inc. has announced the Series/2 automation system for insurance agencies, using a version of the Wang Laboratories, Inc. 2200 MVS CPU with 600-nsec processing speed and support for up to 240 Wang 2236 workstations or Professional Computers.

Storage capacity of the Series/2 exceeds 320M bytes or 250,000 policy files, the company said. Financial analysis, policy file management, word processing and a variety of personal computer software is available, including IBM Personal Computer-compatible types. The Redshaw P-400 printer, said to print over 400 line/min of letter-quality type, is also provided with the system.

The price for a system with the Wang 2200 and eight workstations is about $88,000, the vendor said.

Redshaw, 103 Yost Blvd., Pittsburgh, Pa. 15221.

DATA STORAGE

METHEUS-COMPUTERVISION, INC.
MS200 mass storage system

Metheus-Computervision, Inc. has released a mass storage system that provides up to 840M bytes of additional storage space formatted for Metheus-Computervision Design Systems. The MS200 has an average access time of 18 msec and a data transfer rate of 1.86M byte/sec.

The system offers a choice of either one or two 420M-byte Winchester disk drives or one Winchester drive and one Cipher Data Products, Inc. magnetic tape drive. It is fully field-upgradable, according to the vendor.

The price of the MS200 is $27,500 with one 420M-byte disk drive, and with the addition of one Cipher tape drive, it costs $35,500, the vendor said.

Metheus-Computervision, P.O. Box 959, Hillsboro, Ore. 97123.

MICRO TECHNOLOGY, INC.
MD4000 series subsystems

Micro Technology, Inc. has introduced three products in its new MD4000 series of subsystems. The products are designed for use with Digital Equipment Corp.'s LSI-11, LSI-11/2, LSI-11/23 and LSI-11/73 computers running under DEC's RT-11 and RSX-11M operating systems and using S&H Computer Systems, Inc.'s TSX-Plus time-sharing software.

The MD4260 consists of a 40M-byte fixed Winchester drive and a 60M-byte streaming cartridge tape and is designed for speed and reliability on backup capability, the vendor said.

The MD4910 is a 5¼-in. form factor removable Winchester subsystem. It consists of dual 10M-byte removable cartridges and is said to lend itself to sensitive or classified applications.

The MD4110 consists of a 40M-byte fixed Winchester drive and a 10M-byte removable media Winchester device and lends itself to on-site backup, software upgrades and installation of new software, according to the vendor.

The price of the MD4260 is $7,156, the MD4910 is $5,679, and the MD4110 is $6,370.

Micro Technology, 1620 Miraloma Ave., Placentia, Calif. 92670.

NCR offers 9100/System, POS units for retail use

DAYTON, Ohio — NCR Corp. has announced the 9100/System hardware and software for general merchandise retail operations and two point-of-sale terminals for the specialty store marketplace.

The 9100/System is said to use very large-scale integration technology and communications technology that allows files resident at local sites to be accessed by remote central computers. The architecture provides on-line transaction processing, automatic price lookup, efficient inventory control and automatic credit authorization.

The system uses the company's standard computer system interface, an Ansi standard peripheral interface protocol. The 9100 features up to 1M byte of memory, a 5¼-in. flexible disk, two 5¼-in. Winchester disk drives, up to 37M bytes of storage and the standard computer system interface controller. The desk unit measures 10-in. wide by 27-in. deep by 29-in. high.

The 9100/System uses IBM's Systems Network Architecture for data communications. The company's Tcos operating system is intended for maximum efficiency in a distributed transaction processing environment.

Tcos has a series of subsystems, including a Cobol interface, a function scheduler and a file management system.

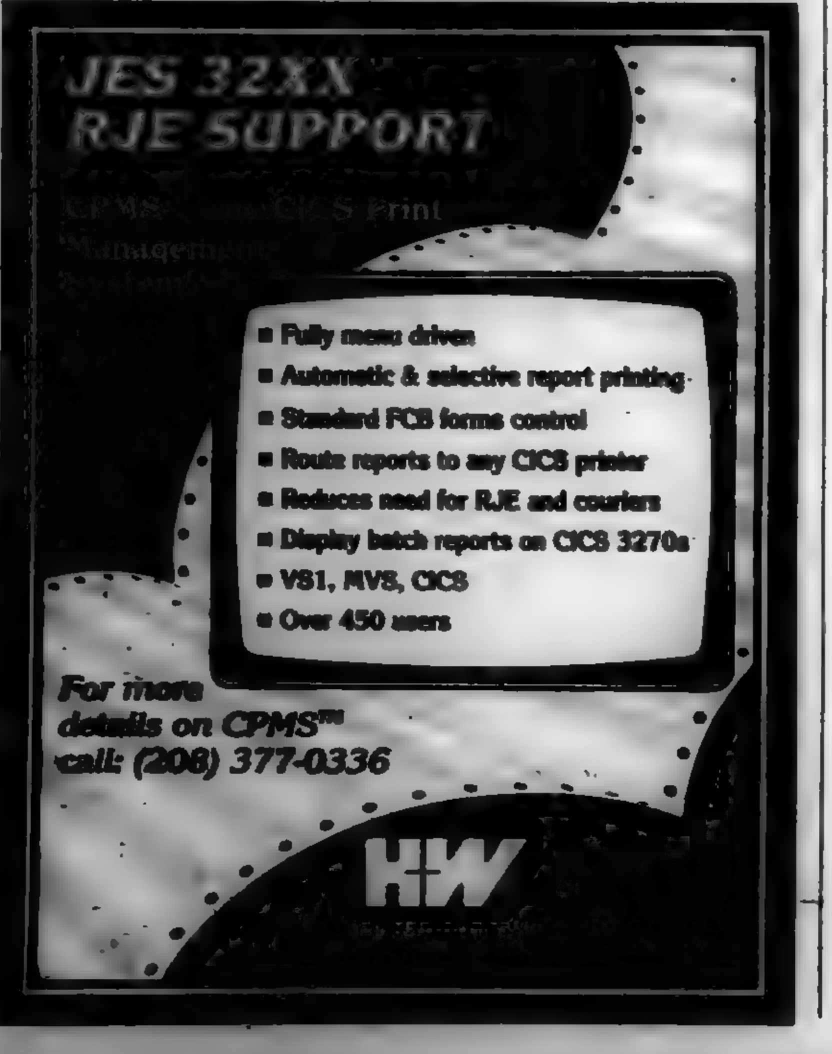
The price of the 9100/System hardware is $23,000, and the price of the software is $8,000, the company said.

The 2155 terminal can function as a stand-alone or primary terminal controlling 2154 satellite terminals in a cluster. The 2154 is intended to function as a secondary terminal. Both terminals are programmable in Basic, the company said.

The 2155 and 2154 terminals in a cluster environment operate on a shared resource basis. The 2155 has a programmable 50-key, point-of-sale function keyboard, 170 line/min printer, cash drawer and operator display, the vendor said. A 5¼-in. floppy disk drive, expandable to dual flexible disk drives, is included with the terminals. Standard memory is 128K bytes, expandable to 256K bytes.

Three communications adapters available include asynchronous, common carrier Data Link Control and common carrier bisynchronous for communicating with the host processor. The price of the 2154 is $3,310, and prices for the 2155 start at $4,405, according to the vendor.

Additional information is available from NCR, which is located at 1700 S. Patterson Blvd., Dayton, Ohio 45479.



- Fully menu driven
- Automatic & selective report printing
- Standard FCB forms control
- Route reports to any CICS printer
- Reduces need for RJE and couriers
- Display batch reports on CICS 3270s
- VS1, MVS, CICS
- Over 450 users

Q. CAN A CABLING SYSTEM UNTANGLE TELECOMMUNICATIONS?

A. With all the various devices a company uses to process, move and store information, it's easy to lose sight of one important element—the need to connect all these devices together. That's where a uniform, structured cabling system fits in. But are you just substituting one set of wires for another? Here are some questions and answers that might help you better understand the role a cabling system can play both in solving your communications problems today and in protecting your telecommunications investment for tomorrow.

Q. First of all, just what is a cabling system?

A. A cabling system is designed on a "wire-once" concept. Just as electrical wires are run in buildings today, a cabling system is a permanently installed set of wires that connects the computers, terminals, workstations, telephones and PBXs within a large office building or a campus. This cabling system should also be the foundation for local area networks of the future.

Q. Aren't my computers and telephones already hooked up to a cabling system?

A. It's not so much a cabling system as it is a bunch of cables. Look above the drop ceilings in most office buildings, and you'll discover miles and miles of all kinds of cable. And much of it, strangely enough, is unused. The reason for this waste is that few devices (i.e., telephone, terminal, personal computer, etc.) use the same type of cable. Consequently, when a new device is installed or when one is moved from one office to another, it's quicker, easier and cheaper to run a new cable than it is to remove and reroute the old cable.

This is not to suggest, however, that running a new cable is quick, easy or inexpensive. Relocating just one terminal can cost as much as $1,500. Not to mention a week or two of downtime while the wiring gets done. And when you think about how often office workers move from one workplace to another, you can see that we're talking about a considerable expense.

Q. How can a cabling system help solve my wiring problem?

A. Once installed, a cabling system can make wiring for a new or relocated terminal as easy as moving a plug from one socket to another. The IBM Cabling System calls for the one-time installation of a single cable running from each workplace, inside the walls, and into a central "wiring closet." In the office, that cable terminates in a standard faceplate on the wall, not unlike an electrical outlet. In the wiring closet, the cable terminates in a patch panel that can connect it to any number of devices.

The installation of the IBM Cabling System should be considered if you're adding a number of new workstations, installing a PBX, doing a major renovation or building a new office building. In many cases the "wire-once" benefit will cost-justify the IBM Cabling System in five years.

Q. How do the telephone and the IBM Cabling System work together?

A. The IBM Cabling System can be used for data only or for both data and voice. When the voice capability is used, the voice wires are separated from the single cable in the wiring closet and run to a telephone switching system. Several major PBX manufacturers have tested their PBXs and telephones with the IBM Cabling System. They report that the voice wires fully support their PBX features and transmission speeds.

Q. How can the IBM Cabling System help me today?

A. Currently being installed in office buildings, the IBM Cabling System can connect most of the available IBM data devices, such as personal computers and workstations, small and intermediate computers. We expect that it will also connect many devices made by other manufacturers.

Q. How will the Cabling System help answer my telecommunications needs of the future?

A. The quality and reliability of the IBM Cabling System enable it to transmit data at very high speeds. This makes it the ideal foundation for IBM's planned general purpose local area network (LAN). This LAN, utilizing a "token-ring" technology, can be implemented gradually to connect different workstations, departmental systems and large processors. So by investing in the IBM Cabling System today, you'll not only save money on current installation and rewiring costs, you'll also be better prepared to meet your telecommunications needs of the future.

Q. How do I go about getting the IBM Cabling System?

A. There are a number of design and installation companies that can plan your cabling system and do the actual wiring. The cable and accessories are available through authorized distributors. Your IBM marketing representative can provide you with the names of these companies. The cable and accessories can also be ordered directly from IBM.

Q. Where do I go from here?

A. Installing the IBM Cabling System today is really installing the foundation for your company's future in telecommunications. So you'll want to plan quite thoughtfully. We can help. If you'd like a free copy of the brochure, "The IBM Cabling System," call 1 800 IBM-2468, Ext. 90, or return the coupon.

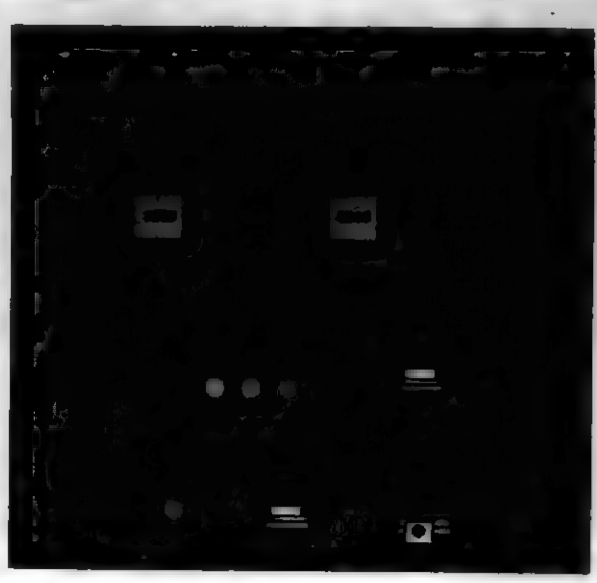
The HP 3000 compu

However much you change, you're going to need both office automation *and* distributed data processing. Fortunately, one company gives you both in a single system.

Hewlett-Packard's HP 3000 is a fully compatible family of computers, ranging from a new system that handles as few as two users to a distributed mainframe that connects up to 400. You can run the same software right up the line.

And all of our systems can change and grow right along with you. Whenever you're ready for upgrades and additions, you simply plug your existing programs into the new systems. No recompiling. No time and money wasted on conversion.



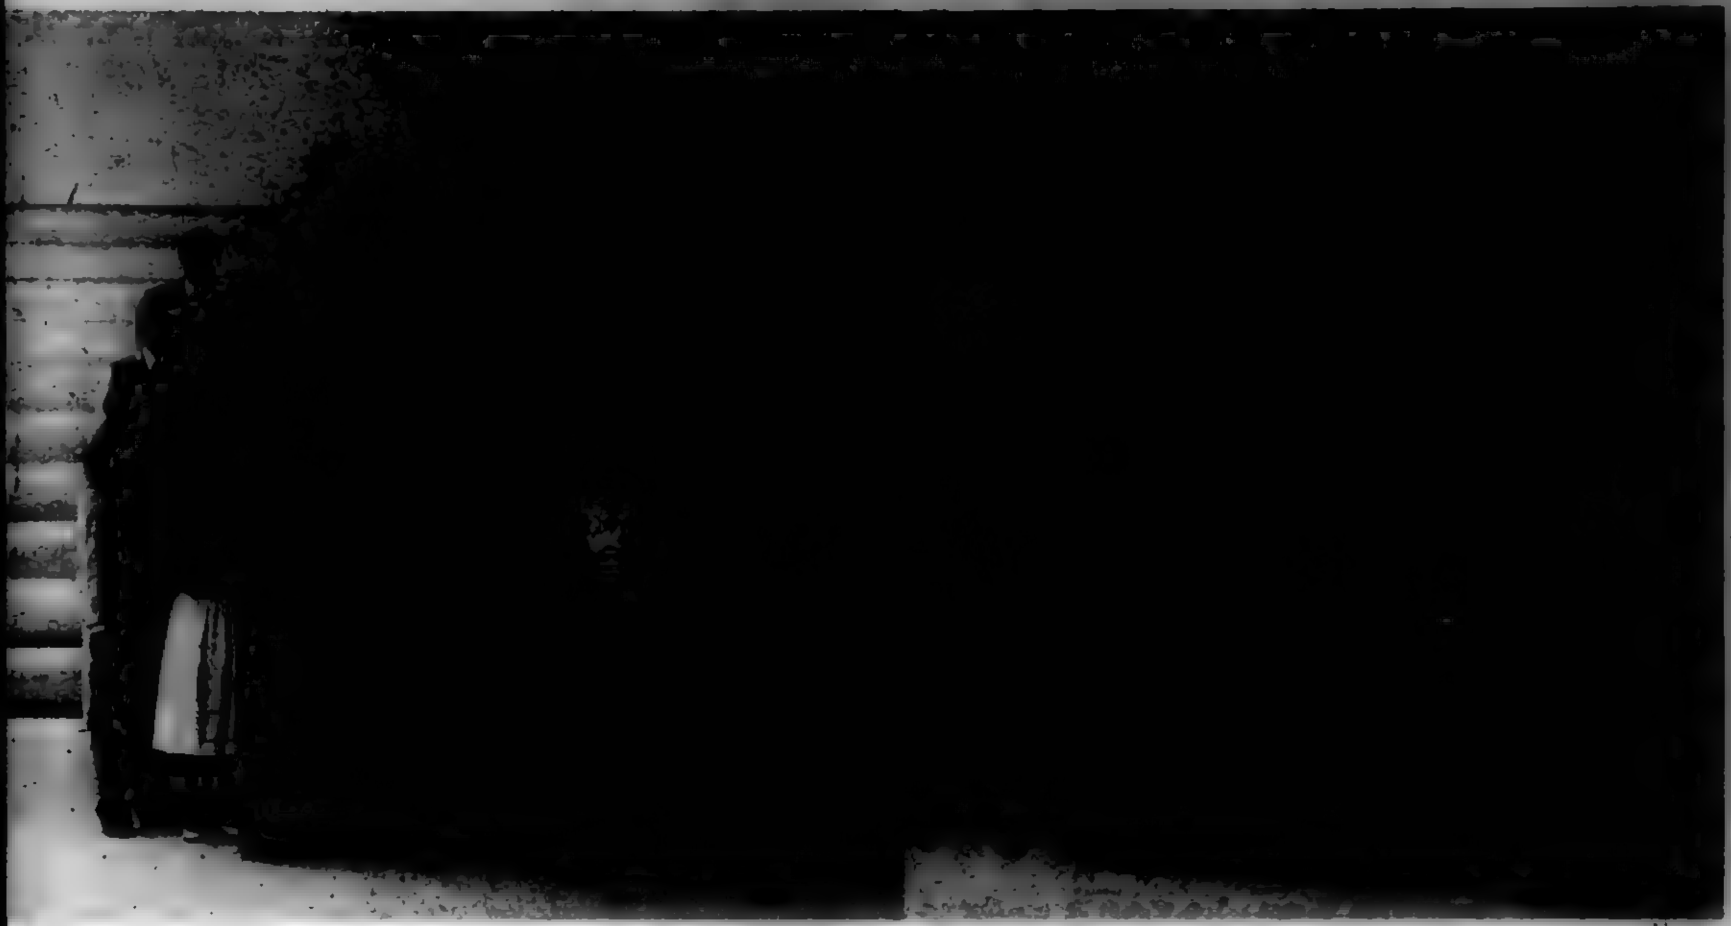
A small, but mighty, addition.

The new HP 3000 Series 37 Office Computer, the latest member of the family, puts the power of the HP 3000 within the reach of smaller budgets.

So now you can afford to give your branch offices and departments their own systems. And they'll still remain part of your overall DP picture with links to other systems.

In the office, the HP 3000 is the heart of our Personal Productivity Center. This integrates the information people need to get their jobs done more productively.

It provides an interface for a wide range of workstations, peripherals and personal computers, including our Touchscreen



ter. One family fits all.

Personal Computer and The Portable, as well as IBM PCs. And it allows them to interact directly with the HP 3000. So your people won't have to learn DP commands.

You'll communicate better with HP AdvanceNet.

Our communications go well beyond this office network. With HP AdvanceNet, they extend to links with other HP 3000s, in the same building or on the other side of the world. And to your mainframe computers, ours or IBM's.

Currently, more than 10,000 HP 3000 systems are working in networks so effectively that our communications were voted #1 in a national survey.

A Datapro poll also rated our service #1. So you get more than office automation and data processing in a single system. You get all the support you need from a single company.

For a demonstration of the single solution for both sides of your company, contact your local HP office listed in the white pages. Or write for complete information to Susan Curtis, Hewlett-Packard, Dept. 003203, 19055 Pruneridge Ave., Bldg. 46T, Cupertino, CA 95014.

In Europe, write Michael Zandwijken, Hewlett-Packard, Dept. 003203, P.O. 529, 1180 AM Amstelveen, The Netherlands.

We'll fit you no matter how much you change over the years.

Productivity. Not promises.

HEWLETT PACKARD

SYSTEMS & PERIPHERALS

TERMINALS

ANN ARBOR TERMINALS, INC.

Ambassador XL; Guru XL

Ann Arbor Terminals, Inc. has introduced two vertical format 15-in. display terminals. The units were designed for word processing applications and are part of the company's XL series of Ansi standard CRT display terminals.

The Ambassador XL features a 4,800-char. memory that can be positioned on the screen in a 60-line by 80-col. format and scrolled or vertically zoomed through in other user-defined display formats ranging from 18 to 60 lines, the vendor said. This editing terminal can operate in both interactive and block modes at data rates up to 19.2K bit/sec.

The Guru XL has a 28K-byte memory that can be configured in formats of up to 66 lines by 170 columns. The off-screen memory can be partitioned into pages of text or scrolled through horizontally and vertically to accommodate large files of data, according to the vendor. Set-up modes allow for black characters on a white background and adjustment of screen brightness levels.

The keyboard used on both units is programmable with any Ascii string on up to 30 levels. Keys can be tagged for local only, send only and repeat control.

Price of the Ambassador XL is $1,595 and for the Guru XL is $2,395.

Ann Arbor Terminals, 6175 Jackson Road, Ann Arbor, Mich. 48103.

INTECOLOR CORP.

Model 8810, 3810 terminals; Series 2000 monitors

Intecolor Corp. has introduced the Model 8810 and 3810 color terminals, compatible with the company's 8001G terminal, and the Series 2000 19-in. monitors.

The Model 8810 features 32K bytes of random-access memory, three serial I/O ports and one parallel port and support for up to seven character sets of 128 characters each, according to the vendor.

The Model 3810 color terminal, a smaller version of the 8810, features a 13-in. display, tilt screen and detached keyboard and a display format of 80 lines by 48 characters, the vendor said. A rack-mounted version of the 3810, the Model 3881, is also available.

The Series 2000 monitors are intended for personal computer-based control applications and are available for Texas Instruments, Inc.'s Professional, IBM's Personal Computer and compatibles.

The Model 8810 color terminal costs $3,145; the Model 3810 costs $2,645; and the Model 3881 costs $2,995, the vendor said. The price for a Series 2000 monitor is $1,595.

Intecolor, Intecolor Drive, 225 Technology Park, Norcross, Ga. 30092.

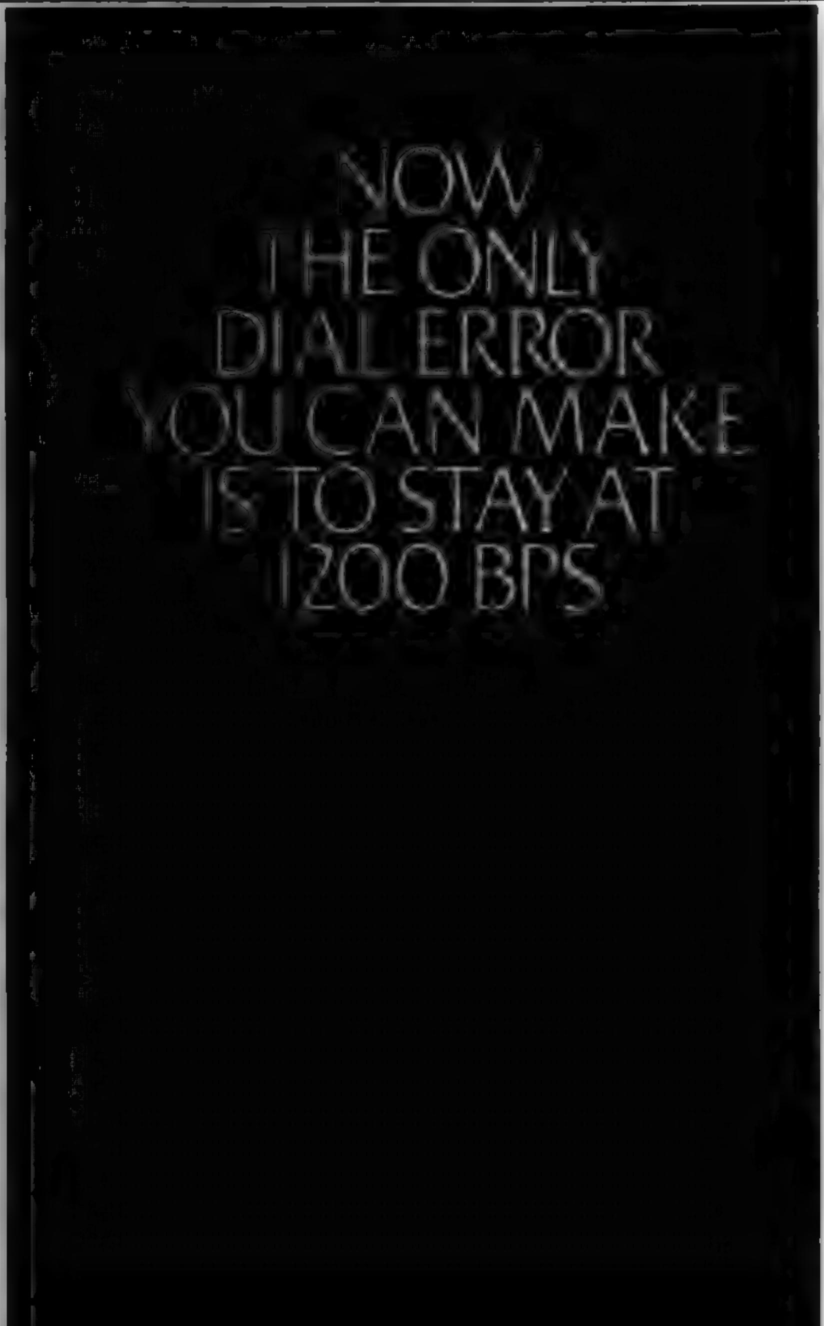
DEC from page 47

ability, distributed file management and software development features. "It's a very sophisticated operating system. It's a strong alternative to [AT&T's] Unix," he said.

Clay Prestia, vice-president of technical development for Raxco, Inc. of Rockville, Md., which provides analysis and performance aids for VAX VMS systems, characterized the 8600 as having a mainframe-like architecture that is distinguished from the VAX-11/780 supermini architecture by the 8600's separate memory-to-CPU and I/O transfer buses. "The big slowdown with the previous architecture in the 780 was the big slowdown in the memory path," Prestia said. "Anytime the I/O is happening, the CPU has to wait for the memory path to clear. That doesn't happen in the 8600."

But while DEC would like to compete with IBM with the 8600, Prestia said, "Where DEC shoots themselves in the foot . . . is [in] the efficiency of the I/O handling in their software. DEC will have a hard time making a big dent into traditional DP areas until they do something about the efficiency of the software."

The analysts agreed that the 8600 announcement puts no immediate pressure on competing supermini vendors to match performance, since the 8600 is a catch-up product. But since the biggest box is often thought to be the easiest to sell, firms like DG and Prime are likely to respond eventually.



Announcing Codex's 2230 Series dial modems.

Now you can get 2400 bps productivity with the reliability you expect at 1200 bps.

Codex's 2230 Series full duplex modems accomplish this through the industry's only proven, second generation design. A design that combines powerful automatic and fixed equalization, delivering leased-line performance over any dial network.

The 2230 Series lets you operate at both 2400 bps and 1200 bps, allowing for faster screen fills and file transfers, reducing computer port needs, and drastically reducing line charges.

There's even a model with programmable auto call. So you can send data unattended at night when rates go down.

Each 2230 Series model is fully Bell 212 compatible. Each accommodates all communications protocols and meets the CCITT international 2400 bps dial standard. You can integrate Codex 2230's into your network gradually or all at once, without putting your system in turmoil.

Then, there's Codex's worldwide service and support organization, ready to answer any question or solve any problem.

Plus very attractive options to buy or lease.

To get the complete story on Codex's advanced 2230 Series dial modems, dial 1-800-421-7700, ext. 881. Or write: Codex Corporation, Dept. 707-81, 20 Cabot Boulevard, Mansfield, MA 02048.

SOFTWARE AG

The innovator sets the standard with perfect vision.

In the 1970's we developed a system to provide data independence—before there was such a thing as a relational data base.

Next, we introduced a high productivity programming language for developing applications in an on-line data base environment—before there was such a thing as a fourth generation programming language.

In both cases we anticipated a trend, and delivered a product to meet a need before it was even defined by the industry.

We didn't just stop there.

We recognized the importance of maximizing worker productivity at a time when others were concerned about the high cost of machines. That's why we are the first to present an integrated series of products that use the same language.

We identified the need for a high volume product for VAX machines—while most still considered the DEC-VAX equipment only for low volume, low capacity applications.

We saw the necessity of having many machines working in coordination and developed our family of networking products to support this trend.

We realized the requirement for true distribution of data, so we carefully integrated data communication capabilities with our data base software.

By listening to our users, we anticipated the growing importance of 24-hour-a-day access to data. As a result, we now offer the first nonstop data base.

Today, while others are busy putting labels on our innovations, we are quietly moving on to our next innovation. And, that's the proper plan for the world leader in advanced systems software.

How can you be sure that your company will be ready for the challenges of tomorrow? Call us today.

UNITS

from page 52

ZENTEC CORP.
Zephyr DD-220

Zentec Corp. has introduced an alphanumeric terminal designed to be compatible with the Digital Equipment Corp. VT220 terminal.

The Zephyr DD-220 is said to emulate fully the VT220 and to feature a 14-in., lockable tilt-and-swivel monitor. It has a 105-key, detached, low-profile keyboard with an 18-key accounting-style pad. Fifteen of the 20 function keys are programmable, the vendor said.

Available character fonts include Ascii, the U.K. national set, DEC special graphics, multinational characters and a downloadable soft character font. The 25-line display can be 80 or 132 columns with bidirectional scrolling. Green or amber phosphor displays are available. The terminal also features blinking, bold, underline, normal or reverse video and double-high, double-wide and blank attributes on a character-by-character basis, the vendor said.

The Zephyr DD-220 costs $850.

Zentec, 2400 Walsh Ave., Santa Clara, Calif. 95050.

TERM-TRONICS, INC.
Miracle 178P

Term-Tronics, Inc. has announced the Miracle 178P, an IBM 3178-compatible terminal said to be equipped with a printer port that can be used to make an Ascii printer operate like an IBM 3287-type asynchronous printer.

The terminal features a 12-in. CRT, a 1,920-char. green phosphor screen, a tilt-and-swivel base, operator-adjustable screen contrast and brightness and an RS-232C printer port, the vendor said.

The Miracle 178P is priced at $1,145.

Term-Tronics, 7408 Trade St., San Diego, Calif. 92121.

MOTOROLA, INC.
KDT 480 Mobile Data Terminal

Motorola, Inc.'s Communications Sector has announced the KDT 480 Mobile Data Terminal, a wireless data terminal that can act as a stand-alone unit or be connected to a vehicle's radio.

The terminal can be connected to a fixed-position radio that transmits to and receives from a mobile radio, sending information back to a controller that acts as a telephone modem, the vendor said. The microprocessor-driven controller reportedly can communicate with IBM's Systems Network Architecture as well as binary synchronous and asynchronous protocols.

Features reportedly include random-access memory storage of up to 3,000 char., a text area of more than 20 sq in. and 12 lines of 40 char. in each format.

The terminal is priced at $3,295.

Motorola, Communications Sector, 1301 E. Algonquin Road, Schaumburg, Ill. 60196.

PRINTERS/PLOTTERS

GENERAL BUSINESS TECHNOLOGY, INC.
6630XP

General Business Technology, Inc. has announced the 6630XP laser printer for use with IBM's System/34, 36 and 38 processors, as well as with IBM's Personal Computer.

According to the vendor, the 6630XP produces up to eight pages of letter-quality type per minute. Two type styles are built-in, and additional font cartridges are available.

The printer interfaces with IBM systems via standard twin-axial cable. For remote applications, the printer may be connected through an IBM 5251-12 or 5294, the vendor said. The 6630XP is priced at $5,995.

General Business Technology, 1891 McGaw Ave., Irvine, Calif. 92714.

GOULD, INC.
Colorwriter 6120

Gould, Inc.'s Recording Systems Division, has announced the Colorwriter 6120, a seven-pen, general purpose plotter for business, scientific and engineering graphics.

The Colorwriter 6120, with RS-232C or Centronics Data Computer Corp.-type interfaces, is said to be compatible with Lotus Development Corp.'s 1-2-3 and Symphony, Sorcim Corp.'s Supercalc 3, Ashton-Tate's Framework, Decision Resources, Inc.'s Chartmaster and Signmaster and Graphic Communication, Inc.'s Graphwriter.

Features include paper size selection, front panel pause, reset and scale controls, a 7 in./sec plotting speed and .002 in. resolution. Prices begin at $895.

Gould, Recording Systems Division, 3631 Perkins Ave., Cleveland, Ohio 44114.

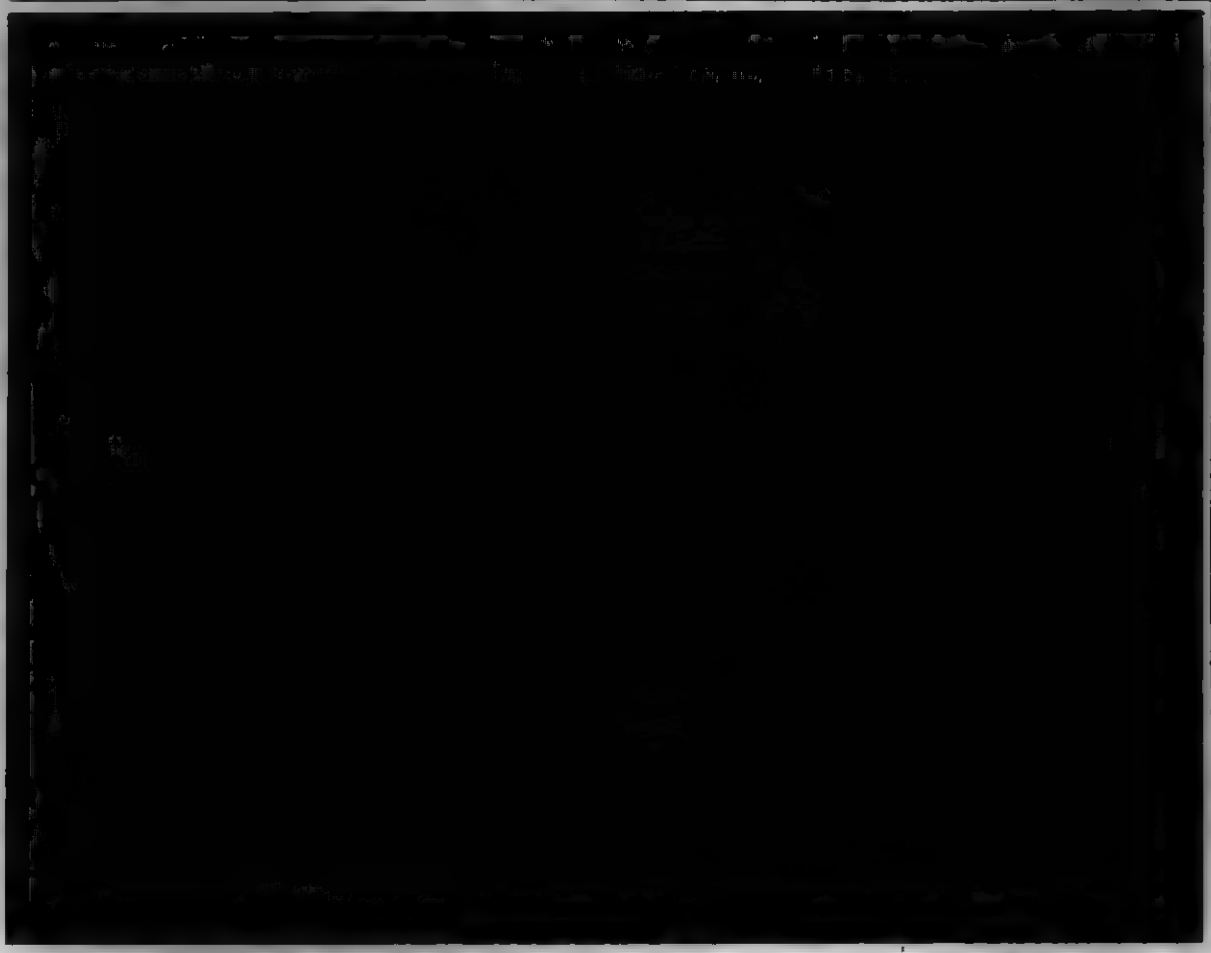
SYTEK

from page 47

store a list of authorized users and certain characteristics about each user in its memory. The Authentication Server is also said to maintain a record of user logon attempts in memory.

Sytek said the system will be available in mid-January. The price for one Authentication Server and 50 Passports will be $31,000. An additional server would cost $25,000, while another 100 Passports would cost about $8,000.

Additional information is available from Sytek, Data Security Division, which is located at 1225 Charleston Road, Mountain View, Calif. 94043.



High Tech! And a healthy regard for your budget.

When we say "what you see is what you get," we mean you get real value. And we some of the world's most exciting, state of the art equipment produced by manufacturers we've singled out to represent, because they offer products that are worth your money.

A prime example is the smart-looking and smart-operating WY-75 Display Station from Wyse Technology.

Wyse has been able to package many of today's biggest and brightest ideas—like a LARGE 14" screen and 80/132 columns display—in one of the most interesting, attractive and compact terminals you'll ever see.

The WY-75 is fully software-compatible with the DEC VT-100 so it will operate with the majority of DEC or UNIX-based software systems.

But don't get the idea that high-end features price the WY-75 out of sight.

Loonam invites Wyse buyers to compare. You won't find a better value anywhere. The WY-75 is the price performance leader in the ANSI 3.64 market.

LOONAM. We'll show you a difference.

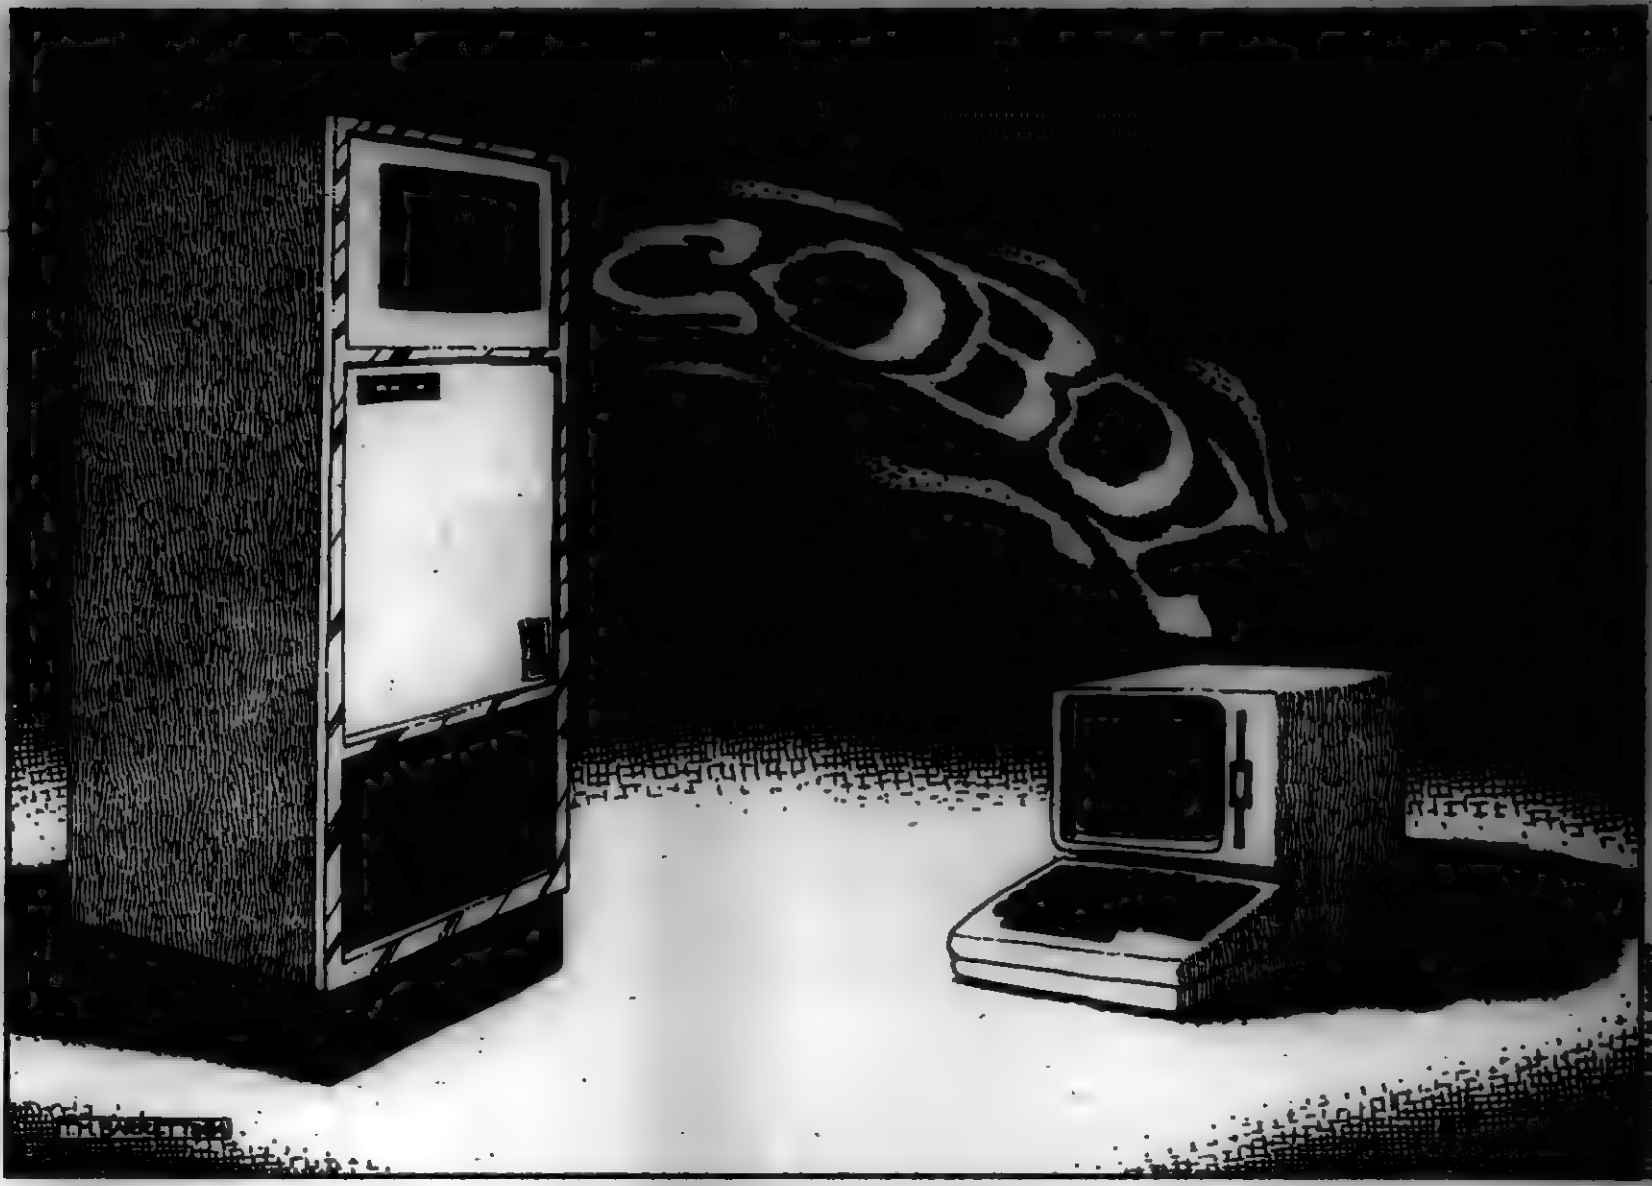
AT&T

IN DEPTH



Running your Cobol on micros

(at least some of it sometimes)

By Anthony Fedanzo Jr.

Any Cobol programmer should be able to begin programming on a micro within a week — given microprocessor hardware, a Cobol compiler, word processing for source editing and a data communications package to transfer source and test files.

Even in this age of the microprocessor, the tremendous investment in existing Cobol applications should be exploited as long as possible.

Major vendors such as IBM, Hewlett-Packard Co. and Digital Equipment Corp. have responded almost without notice by providing 16-bit machines to run many mainframe and minicomputer Cobol applications. This response is possible because these companies and other 16-bit systems vendors run Microsoft Corp.'s MS-DOS operating system and one of several Ansi Cobol-74 implementations.

With some relatively minor modifications, many existing mainframe and minicomputer applications can be transported to available 16-bit micros. Two conditions favor decentralized computing by distributing work to microprocessors: the cost of creating replacement application systems and the backlog of systems development.

Microprocessor distributed data processing (DDP) affords the benefits of decentralized computing along with a potentially large saving that would otherwise be expended on replacement systems. While each vendor's product runs a slightly different version of MS-DOS, the fact that they have this common operating system means they are very similar from an applications perspective.

The real and potential benefit to corporate and small-business computer users stemming from this standardized micro operating system and language is the opportunity to implement DDP on systems costing $4,000 or less, while using existing source code.

Little, if any, discernible difference exists between Cobol applications on a major vendor's system and those of the so-called IBM Personal Computer clones. At the level of MS-DOS and Cobol, the similarities between 16-bit micros far overshadow their differences. This situation is unparalleled in the mainframe and minicomputer market, where vendor-to-vendor application transfers are frequently difficult even at the source-code level.

Compatibility of the basic operating system from vendor to vendor has made it possible to implement standard Cobol (and enhancements) on a wide variety of 16-bit systems. Most major vendors have contracted with a software company to implement the version of Cobol they offer. With few exceptions, these implementations are Ansi X3.23-1974-compatible. At this time, there does not appear to be a push taking place to implement Cobol-80 on microprocessors. It is reasonable to assume that the lack of a new version of Cobol simply reflects a benign neglect on the part of vendors and software houses, rather than a deliberate plan to retard the spread of Cobol in the micro world.

Similar implementations of Fortran 77 (Ansi 3.98) have taken place within the last two to three years. It is now possible to transport Fortran 77 code from, for example, an HP 3000 minicomputer, make a few slight I/O syntax changes and then bring it up on either an IBM Personal Computer or HP 150 without further modification. Business applications and some scientific Fortran applications can be moved from system to system with very little modification in the source. Because most business applications are written in Cobol, that language will serve as the exemplar for microprocessor DDP as outlined here.

The real and potential benefit to corporate and small-business computer users stemming from this standardized micro operating system and language is the opportunity to implement DDP on systems costing $4,000 or less while still using existing source code. Existing source code in Ansi format can be downloaded to a micro via the available data communications packages, then modified slightly for differences in disk I/O, file types and CRT handling, as required.

The minimum microprocessor hardware required for practical microprocessor DDP is a 256K-byte system with two floppy disk drives. Increasing memory or adding a hard disk expedites the course code conversion task in many cases, but it is not essential. It is fairly easy to convert 2,000-line Cobol programs that access files containing thousands of records using a 256K-byte microprocessor system with two floppy disk drives.

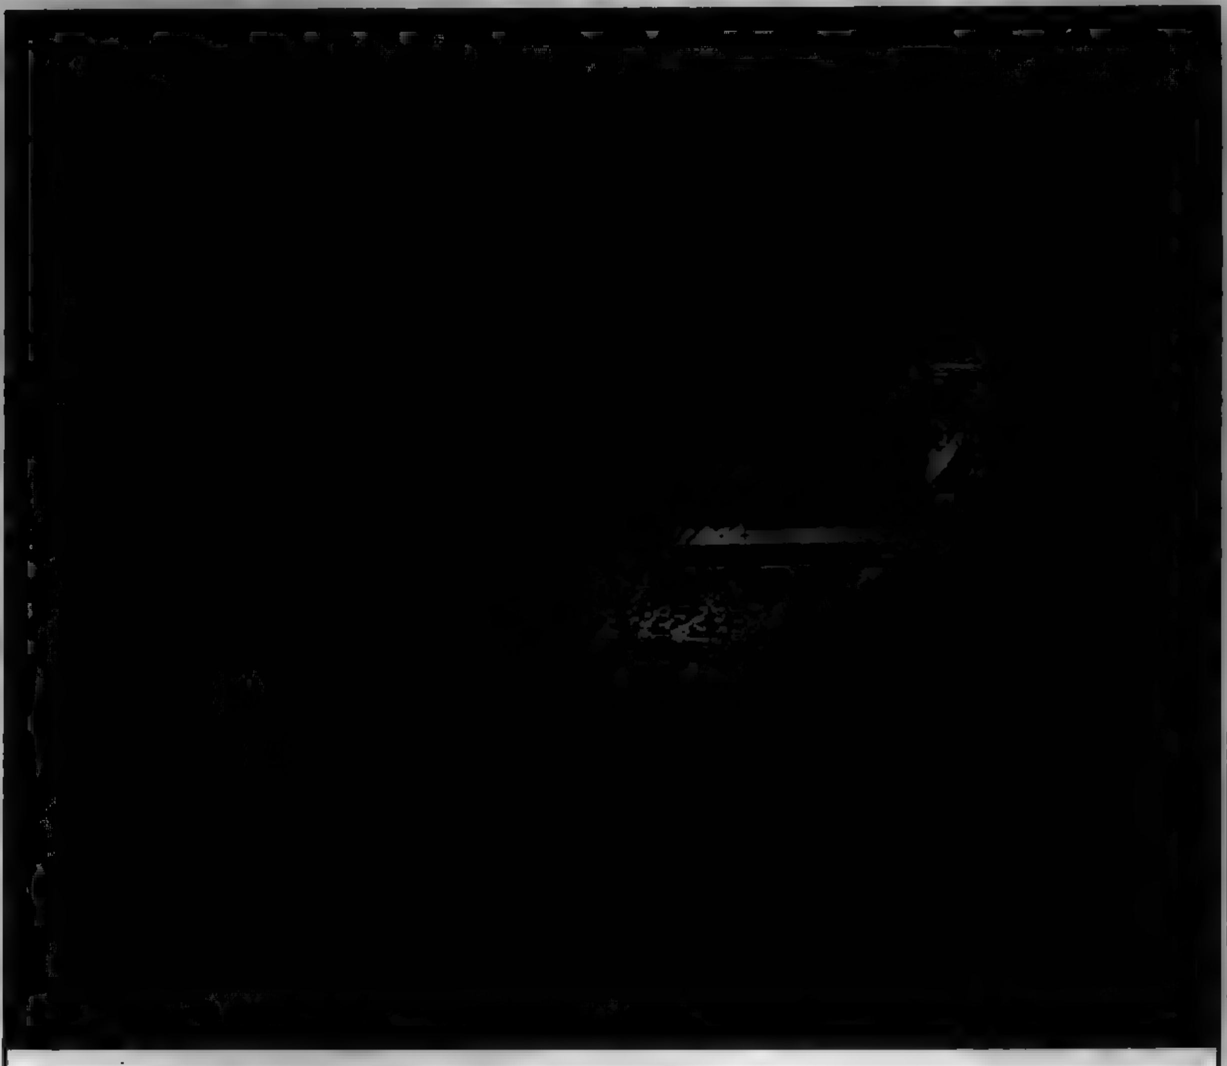
If you are planning on doing a substantial volume of Cobol work, the added expense of larger memory and a hard disk on development systems are worth the cost. The major problem to avoid when using large microprocessor development systems is the chance that executable program size will exceed the main memory limitation of the intended target hardware. This problem can be kept under control by keeping a target machine near the development system for testing purposes.

Advantages of Cobol

Most of the attention that Cobol on microprocessors has received centers upon using the micro as a programmer's workbench. While this is certainly a useful approach to off-loading mainframe tasks, it is only one side of the potential use of Cobol on micros. The other side is implicit in the very ability to write and compile mainframe-compatible Cobol on a microprocessor in the first place.

For buyers of 16-bit microprocessors, the "gee-whiz!" emphasis of much software advertising and the problems of coupling micros to mainframes in useful configurations has tended to obscure the fact that they are general-purpose computers in their own right. The ability to function as stand-alone machines means normal Cobol and Fortran programming tasks can be conducted on these systems. When this capability becomes noticed, it's natural to begin thinking about using them to run routine business applications just like their 16-bit minicomputer and larger mainframe cousins.

When micros are used to run routine applications, the goal of centralized data type and format control can be attained while still allowing individuals and groups local control of the data itself. This accomplishment goes a long way toward distributing and decentralizing data processing without abandoning the equally desirable goal of maintaining a single organizational data standard.



The 3270 alternative designed for the way the other half works.

Telex new 078 and 079 people compatible terminals. 3270 compatible on the inside. People compatible on the outside. Now you can have IBM alternatives that are compatible with the other half of your 3270 system. The people half. And since they're from Telex they feature the only kind of compatibility we know. True compatibility.

For the people half. Ergonomics. A ten dollar word that can mean millions. Because it's a design concept that makes people part of the design process. Which makes people and machines work together more efficiently. More productively. With Telex that means displays and keyboards that move and tilt to fit the user. Screens and keys that are easy on sight and touch. It means lower profiles and reduced sizes to make better use of the workspace, too.

For the 3270 half. The 078 and 079 are from Telex, a recognized leader in 3270 terminals. So you know you're getting true IBM device compatibility. Along with the Telex nationwide network of service and support.

On the whole. IBM compatibility from the company that's helping to establish the industry's standards. People compatibility based on the standards set by the world's leading ergonomic designers. Both standards that will someday be the rule are part of these exceptional new Telex products today. And part of a whole new line of people compatible products for tomorrow.

DIGITAL BRINGS VAX TO LARGE SCALE COMPUTING.

INTRODUCING THE VAX 8600 SYSTEM.

Your applications can do exactly what you want them to on Digital's new VAX™ 8600 computer system. They can expand. User population can increase. Scientific problems can become more complex. Transaction volume can intensify. And data storage requirements can grow exponentially.

The VAX 8600 system gives you unprecedented capacity for applications growth. It's the first of a new generation of large scale VAX processors, with memory expansion to 32 million bytes and online storage up to 160 billion bytes. Yet the VAX 8600 system maintains complete architectural compatibility with every other VAX processor – including the new desktop-size MicroVAX I™ system. Every system in the family gives you the same VMS™ operating system software, with the same set of proven development tools, communications options and data management facilities. Quite simply, there's not another computer family in the world that can match the growth path you get with Digital's VAX systems.

YOU GET UP TO 4.2 TIMES THE PERFORMANCE.

We've engineered the VAX 8600 system to deliver more than four times the processing speed and performance that the industry-standard VAX-11/780 system is known for. We've achieved this performance increase through the use of ECL gate array technology and several advanced engineering techniques.

Specifically, the VAX 8600 system incorporates four-stage pipelined processing that increases throughput by allowing the system to execute one instruction while it simultaneously decodes a second, generates an address for a third and fetches a fourth. There's also a floating point accelerator that speeds floating point operations.

Even with all its power, the VAX 8600 system conserves floor space. The CPU fits into the same size cabinet as the VAX-11/780 CPU. Power consumption and air conditioning requirements are similar, too.

VAX 8600 SYSTEM HIGHLIGHTS

MAXIMUM MAIN MEMORY SIZE 32 Million Bytes
MAXIMUM STORAGE CAPACITY 160 Billion Bytes
MAXIMUM COMMUNICATIONS LINES 512 plus Local and Wide Area Networks
PROGRAM ADDRESS CAPACITY 4 Billion Bytes
BUS SUPPORT Availability includes 6 UNIBUS,™ 2 SBI, 4 DR780, 3 CI and 4 MASSBUS™
PHYSICAL DIMENSIONS 60½" x 73½" x 30"
POWER CONSUMPTION 6.5 KW (10 KVA)
AIR CONDITIONING REQUIREMENTS 22,200 BTU/hr
ACOUSTIC LEVEL 60 dBA

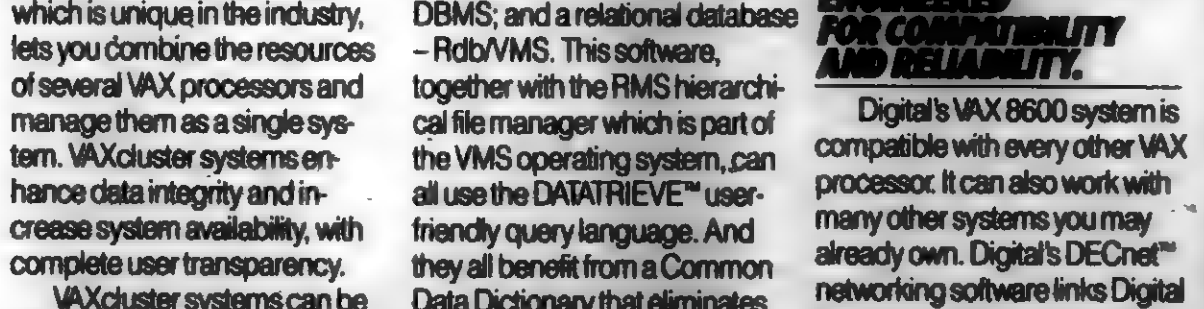
VAXCLUSTERS LET YOU SHARE THE WEALTH OF VAX RESOURCES.

The large-scale storage and multi-user support you get with Digital's VAX 8600 system can be increased many times over with VAXcluster™ systems. This multiprocessing capability, which is unique in the industry, lets you combine the resources of several VAX processors and manage them as a single system. VAXcluster systems enhance data integrity and increase system availability, with complete user transparency.

VAXcluster systems can be configured with up to 16 processors and storage servers in a variety of combinations. You can boost computing power in an existing VAXcluster configuration by adding a VAX 8600 system. Or you can build a new VAXcluster using a VAX 8600 system as a compute server.



The wealth of resources available to all VAX systems includes VAX Information Architecture, which offers a CODASYL-compliant database – VAX DBMS; and a relational database – Rdb/VMS. This software, together with the RMS hierarchical file manager which is part of the VMS operating system, can all use the DATATRIEVE™ user-friendly query language. And they all benefit from a Common Data Dictionary that eliminates data redundancy and permits record-, field- and user-specific security controls. What's more, you can automate your office with Digital's ALL-IN-1™ software.

All VAX systems give you a complete set of program debuggers, editors, and screen management utilities to work with. You have a choice of 15 programming languages. And you can combine different languages in a single application through the common calling standard.

ENGINEERED FOR COMPATIBILITY AND RELIABILITY.

Digital's VAX 8600 system is compatible with every other VAX processor. It can also work with many other systems you may already own. Digital's DECnet™ networking software links Digital systems, users, files and applications over a variety of communication devices, such as Ethernet, leased lines, standard telephone lines, and public wide area networks. We offer protocols for communication with non-Digital environments, such as the SNA™ gateway.

The VAX 8600 system is engineered for the reliability your large-scale applications require. Self-diagnostic intelligence simplifies maintenance.

BEST ENGINEERED MEANS ENGINEERED TO A PLAN.

The VAX 8600 system, like all Digital hardware and software products, is engineered to conform to an overall computing strategy. This means our systems are engineered to work together easily and expand economically. Only Digital provides you with a single, integrated computing strategy direct from desktop to data center.

For a brochure on the VAX 8600 system, contact your local Digital sales office. Or call 1-800-DIGITAL, ext. 280.

THE BEST ENGINEERED COMPUTERS IN THE WORLD.

Application is a candidate for microprocessor distributed processing

Figure 1. Selecting applications for microprocessor DDP

The limitations on types of applications that are candidates for transporting to microprocessor DDP are mostly hardware-related. Even the new 16-bit micros do not handle large data bases with many access paths very efficiently.

Minimal user retraining is required when existing applications are simply transported to a microprocessor environment. This factor is especially important in light of the time and expense required to train users in various applications. Because the microprocessor itself will require learning new skills, time saved not learning the application will be available for gaining familiarity with the new hardware and procedures.

User familiarity with existing applications can serve as a tool for building basic confidence in those who lack skills or are reluctant to approach the burgeoning generation of microprocessors. Most users will approach a microprocessor with less trepidation if they can still use a man-machine interface with which they are already familiar. This familiarity will be most helpful for batch-entry systems and operators, but it extends to even the more sophisticated look-up and accounting-type systems and to their users as well.

Another notable advantage of transporting existing applications to micros lies in the fairly small amount of DP staff retraining that is required. Since most shops operate with a staff of more or less competent Cobol programmers rather than Pascal or Basic wizards, the expense of either retraining or hiring experts in these other languages can be avoided.

Data processing management must provide its staff with the microprocessor hardware, a Cobol (or Fortran) compiler, a word processing package for source editing and a data communications package to transfer source and test files from host systems to the micro. With these tools, nearly any Cobol programmer should be able to begin programming on the micro within a week. The approximate cost of a compiler, word processing package and communications package is $1,500. Very generous discounts are available from some dealers.

Suitable applications

Most batch data entry systems are suitable candidate applications for microprocessor DDP. This covers the range of those that simply accept input from the CRT and pass it to a plain file, through those that do on-line validation of key items such as names, Social Security numbers, client IDs and the like. Branch office project management and inventory control systems exemplify other kinds of applications that are readily transported to a microprocessor. This transportation makes the most sense when packaged software either is not available or would require significant conversion from existing systems to utilize.

Figure 1 shows the general procedure for determining whether an application is a likely candidate for conversion to microprocessor DDP. The essential steps are those that determine data structure, operating cost and program size factors. If these criteria are satisfied, most applications that satisfy them can be moved to a microprocessor.

Locally relevant detail is not always required by a home office. Many time-sharing systems can be transported to and implemented on local microprocessors with a minimum amount of change. Typically, older systems are easier to convert to microprocessor DDP since they tend to be built in less highly integrated modules than newer systems. Micro-to-host data transfer can be facilitated by sending all data in fixed format Ascii files.

This strategy succeeds in most cases because summary reporting rather than wholesale data base transfers frequently constitute the bulk of micro-to-host interactions. In addition, so long as both host and micro can manipulate Ascii data with minimal conversion it is the simplest solution to the data exchange format problem.

For example, an accounts receivable and payable system based on local invoice billing cycles is operable independent of a host system if the Cobol source code and keyed files (Isam or Ksam) are transported to a micro. Since the information a head office typically requires includes weekly sales volumes, plus accounts receivable and accounts payable balances by general ledger account number, this data can be processed locally and sent to the host in summary form.

At this time, the limitations on types of applications that are candidates for transporting to microprocessor DDP are mostly hardware-related. Even the new 16-bit micros do not handle large data bases with many access paths very efficiently.

This factor tends to exclude software that is built upon data base management system (DBMS) packages until Cobol-accessible versions of the mainframe and minicomputer DBMS software are available on micros. It is, however, quite feasible to send subsets of large data bases to micros so long as the transfer takes place in a suitable data format and the data can be held and used locally in plain or Isam files. Transmission of subsets of host data bases will probably comprise the bulk of host-to-micro communications in a microprocessor DDP network.

Technical considerations

A 16-bit microprocessor has an inherent data stack limitation of 64K bytes. This means that applications from 16-bit minicomputers will transport without encountering this limitation. Minicomputers and mainframes that have a larger word size or data address could present problems if the programs to be transported to a micro use a data area larger than 64K bytes. In these cases, the solution is to modularize the program's tasks by either creating separate programs that are run separately or separate programs that are

The Norwegian computer market wants to hear from you.

The Norwegian computer market is expected to grow at an annual rate of 30%. The Scandinavian countries (Norway, Sweden and Denmark) constitute the fourth largest regional market in Western Europe, and according to International Data Corporation, it is a highly developed market.

"The computer is down."

It is ironic that when we become dependent on computers, we are at their mercy. As more and more companies go on line, the industry reliability standard of 98.5% becomes unacceptable because it means your computer is liable to go down once every two weeks, on a statistical average.

So, if you are a broker, banker, manufacturer, or businessman who relies on your computer more and more, take note: Stratus Computers are designed not to fail; not once every two weeks, or once every 200 weeks, or once every 2,000 weeks!

Debunking The Myth That All Fault Tolerant Computers Cost More.

It is a common and reasonable assumption that because there is redundancy (extra programming, or extra components) in fault tolerant computers, that makes them cost more. Where the redundancy is in expensive software, this is true. But Stratus has hardware-based fault tolerance that takes advantage of the extraordinary advances in chip technology. The result – price drops. The fact of the matter is, our hardware redundancy adds a mere fraction to our cost, and absolutely nothing to your purchase price. What's more, in overall price/performance comparisons against the top computer names, including IBM, DEC, and Hewlett Packard, Stratus was at the front of the pack, despite the fact that it included fault tolerance, while the others didn't.

	STRATUS XA400	IBM 4381	HP 3000 68	DEC VAX-11/782
RELATIVE PERFORMANCE*	125	100	64	109
PRICE	$446,350	$707,897	$437,754	$656,889
PRICE PERFORMANCE	$ 3,571	$ 7,079	$ 6,840	$ 5,999

Relative Price Performance Index
**Computerworld, August 20, 1984*

All systems are comparably configured with identical amounts of memory, disk space, and communication lines. But, only the Stratus price includes fault tolerance.

Why Stratus May Be The Best Computer For The Times, For The Money.

Considering its showing in overall price/performance comparisons against the most successful computers, Stratus must be considered. And when you take into account the added efficiency and security of fault tolerance, and the fact that it is the world's most powerful fault tolerant transaction processing computer, Stratus truly becomes impossible to ignore. In the 1980's Stratus simply is the right computer, at the right price. For information, contact your local Stratus sales office, or call Keith Johnson in Massachusetts at (617) 460-2188; or toll-free at 1-800-255-1515.

Multiply Management Power with control — and with MAPPS™.

Sound too good to be true?
Not with MAPPS!

MAPPS (Management And Project Planning System) enables you to:

- SIMPLIFY. Reduce a large, complex project to a model that you can manipulate. MAPPS has a cut-and-paste option that won't multiply complexity. (Or, worse, logic errors.)
- BE REALISTIC. TAILS™, the unique time processing feature, avoids artificial relationships between activities. (Realism makes using the tool worthwhile.)
- TAKE CHARGE. MAPPS was specifically designed to allow the executive or manager to control Time, Cost and Resources. (What else is there?)
- BE YOUR OWN DATA PROCESSOR. MAPPS lists and explains choices on a series of menus. Some require only a yes or no answer. Furthermore, the versatile Select-Sort-Report system lets you tailor reports to meet your needs. (Paper seems to multiply enough. Do your part to reduce excess paper with well focused reports.)
- BE FLEXIBLE. Use any currency in the world. Or, use a 5 or 7-day work week beginning on any day of the week. (The work week can be modelled.)
- ANTICIPATE. Perform "what if?" experiments on the network model to see results without actually committing resources.
- HAVE A CHOICE. MAPPS operates on Data General MV*, Digital VAX*, Wang VS*, and computers using UNIX* operating system. (So you needn't be stuck in the briar patch.)

Figure 2. Mainframe-to-micro Cobol conversion process

linked via the CHAIN statement familiar to Basic users.

As outlined in Figure 2, there is a general procedure for transporting and converting applications to a 16-bit micro. Note that the selection process shown in Figure 1 leads into the tasks required for actually doing the application transportation and conversion. As noted previously, the key factors in such a conversion center upon data, then programs, once the cost justification is completed.

Generally, those applications written in Cobol (or Fortran) that utilize plain files, Isam or Ksam files or relative (random or direct) access files can all be transported to major vendor's 16-bit microprocessors. Practical limitations on program sizes are discussed below and have to be considered on a case-by-case basis.

One obvious limit to program size tends to be just how long it takes the microprocessor to execute a code segment before getting back to the user. In Cobol, one hundred lines of IF . . . ELSE . . . logic seems to be a practical limit above which people notice that response time is not virtually instantaneous. Good structured programming will help minimize this perceived execution time significantly.

As on many mainframes, data files accessed by Cobol programs exist in a Cobol format that requires some minor, but necessary, reformatting before they can be transferred as plain Ascii files or used by programs written in another language. For example, micro Cobol sequential files have two leading bytes of data prefixed to the data files. Relative files have six bytes of header information in the first record of each file. Index files have three bytes prefixed to each data record plus a separate key file.

This file and/or record housekeeping information is transmitted to the host by the available data communications packages. Therefore, it must be stripped off prior to transmission by the micro or upon receipt at the host. In either case, the task is a fairly trivial exercise in data reformatting.

Until a major vendor releases a DBMS package that can be accessed by micro Cobol, three familiar file types make up the range of data storage formats available. These are plan sequential, relative and Index (Isam) files.

Sequential files are available in two forms, depending upon whether the file was created within the micro Cobol environment or from another source such as a word processing package. The relative files, sometimes called direct or random-access files, are used virtually identically to those found on mainframes and minis. Index files in micro Cobol allow a single key only, usually up to 60 characters in length. Judicious selection of the fields making up this key will usually allow it to do double duty as a more complex sorting method.

It is worthwhile to attempt to emulate the microprocessor environment on your mainframe, at least with respect to file structures. This will assist in pretransport changes and provide an opportunity to think through potential problems before they are encountered on the microprocessor. A related advantage of an emulation step is the fact that program changes can be made much faster on most mainframes and minicomputers than on a micro. This

IN DEPTH/COBOL ON MICROS

saving of time can be significant when many programs or lengthy programs need to be transported and converted.

CRT screen displays usually are defined and used within a single micro Cobol program. Two general methods exist for doing this. The first is via the screen section declarations of the data division. In this section, row and column references position field headings, variable fields and their edits. These are referenced by DISPLAY and ACCEPT verbs that simply name the declared screen records.

The second method of CRT handling utilizes direct row and column addressing in the DISPLAY and ACCEPT verb syntax to achieve the same screen layouts as found in the screen section. There are fewer editing options available to the programmer in this second method, but it works equally well.

Most 132-column (or less) line-printer reports will convert to output on a microprocessor provided two basic conditions are met. First, the WRITE statements must be standard Cobol-74 and contain no machine-dependent carriage control that lacks a counterpart in the micro. Second, the printer selected for the microprocessor must be able to print a full 132 columns; many small system printers print only up to 80 columns. You should also consider whether you need multipart forms. Generally, it is difficult to get more than three-part carbon forms to give a clear image on small-system impact printers.

Hardware requirements

The hardware required to compile micro Cobol programs depends upon the program size. A 256K-byte microprocessor with dual floppy disk drives can easily handle 2,000-line Cobol programs. Compile time for programs of this size is about 15 minutes, including generation of the disk image of the listing file. Linking compiled code is done in a second step, as is usual on mainframes and minis. Actual program execution requires that a special Cobol environment file be resident on disk with the application program(s). At runtime, it is loaded into memory along with the application code, for which it provides a runtime library and debug interface.

Most competent Cobol programmers will have little trouble switching between mainframe or minicomputer Cobol and that available on micros. Structured coding techniques still apply to this environment, as do the usual concerns about data editing and security. A great advantage of using Cobol on 16-bit micros resides in the very low level of programmer retraining required. This holds even more true when the programming task is simply transporting existing code to the smaller machines.

Data security on a microprocessor requires careful consideration. Since no single-user 16-bit microprocessor available today has an automatic, foolproof logon/logoff event record, the need for sensible physical security of sensitive data and programs is evident. Physical security in the form of restricted access to the system and data disks is probably the most useful security measure to safeguard your information.

It is easy to add an encryption/decryption algorithm to your Cobol programs or their runtime library to scramble the data in the files accessed. When this measure is taken, distribute only the executable versions of programs to the remote user microprocessors.

Management perspective

The microprocessor may be the wave of the future, but it is a wave that conceals potentially disastrous undercurrents as well as the promise of more effective computing. The programming environment available on 16-bit micros today resembles that available on minis and mainframes during the mid-1970s. Managers should allow for extra man-hours in their estimates of project time because the relatively fast development tools and compilers found on larger systems are not yet on the market for micro versions of Cobol

PROTOCOL CONVERSION

With Innovative's MC-80 Protocol Conversion Series, you don't just get low cost solutions to your network compatibility problems, you get much more...

Boeing puts mainframe decision support on your desk with a difference you can see.

Now you can have large-scale decision support at your fingertips. Our Business Management Workstation combines the IBM® PC XT/370 with compatible mainframe power and our proven EIS® (Executive Information Services) software. The result is comprehensive, integrated decision support with mainframe capabilities — on your desktop.

Boeing takes another unique step, too. We equip every workstation with color graphics. You won't find this impressive capability on the standard IBM PC XT/370. It's one of the extras you get only from Boeing, an IBM Value-Added Dealer.

Of course, the PC XT/370 is itself an amazing machine. With its virtual memory capabilities, you can handle modeling and reporting locally. You can analyze and project events with expanded functionality previously reserved for only the largest computers. Yet you have the convenience and response of your own microcomputer.

Meanwhile, your decision support can take full advantage of mainframe capabilities. You can quickly access your data base on our MAINSTREAM® remote computing service with full compatibility. And you can easily transfer applications and files without the complications traditionally associated with micro/mainframe links.

The software expertise of Boeing and the most advanced personal computer ever offered by IBM are joined to give you unprecedented decision support . . . with solutions that are graphically visible.

For more information on our Business Management Workstation or the location of a sales office near you, call toll-free 1-800-447-4700. Or write BOEING COMPUTER SERVICES, M.S. CV-26-198, 7980 Gallows Court, Vienna, Virginia 22180.

BOEING COMPUTER SERVICES A Division of The Boeing Company

Boeing Computer Services is an Authorized IBM Value Added Dealer for the IBM Personal Computer, PC XT and PC XT/370.
IBM is a registered trademark of International Business Machines Corporation. EIS and MAINSTREAM are registered service marks of The Boeing Company.

and Fortran. Use of hard disks and more main memory will alleviate this situation somewhat, but allowing for the extra time is still prudent.

Consequently, transporting software to micros is faster than writing applications on micros from scratch. Global syntax changes can be made to entire source files prior to transferring them to the micro, where editing and compiling are relatively slow.

These differences in overall performance during programming phases of a microprocessor DDP development project indicate the need for careful advance planning and scheduling. In cases where a new system is scheduled for development of a micro DDP system, coding is often more efficiently handled on a mainframe. It can then be transported to appropriate micros for final development and installation.

In many cases, given appropriate project planning and using a standardized hardware and software base upon which to build applications, the cost of transporting existing Cobol application systems to a microprocessor environment also compares favorably with that of creating whole new applications on them. Again, this is because the task of transporting existing source code is often less costly and time-consuming than that of ground-up analysis, design and implementation.

The issue of who buys the microprocessors in an organization should not seriously impact whether they can be used in a microprocessor DDP strategy. A wide degree of latitude in purchasing micros can be accepted so long as those that are acquired all meet some basic requirements.

In order to use the kind of microprocessor DDP strategy outlined here, all 16-bit micros purchased should be able to use MS-DOS Level 2.0 or above. An X3.23-1974 Cobol language and linker compatible with the MS-DOS operating system should be available. A good data communications package for file transfers to and from host systems should be supported on the microprocessor. These are basic requirements in most planned micro acquisitions and place few, but still firm, restrictions upon the number of vendors from whom hardware can be selected.

User familiarity with existing applications tends to facilitate their conversion to a microprocessor environment. Unless the application is seriously in need of revision or replacement, transporting programs to micros compares favorably with buying packaged software. Even the best packages will require time-consuming learning of some entirely new procedures, plus necessitate fairly radical data format conversions if existing data is to be somehow moved into the package's files automatically.

In the worst case, a package will require manual reentry of large volumes of data already on file. Microprocessor DDP allows electronic transfer of this data with no manual reentry.

Any company that has spent time and effort to develop an organizational data standard will not readily abandon that standard just because packaged microprocessor software does not adhere to its standard. Since existing applications presumably already meet the organizational data standard, their migration to a micro poses no serious problems for maintaining the accepted standard.

Transporting programs to micros often compares favorably with buying packaged software.

This consideration can be crucial if the consequence of using a packaged product entails loss of central control over data formats, edits, validations and types. Where this is an issue, microprocessor DDP using transported applications is a reasonable alternative to changing a data standard or the organization's way of doing business.

DDP is lauded for its role in reducing data communications costs, especially when replacing time-sharing systems. Microprocessor DDP also provides the same benefit as a communications cost saver. In addition, the new 16-bit systems provide intelligent single-user workstations for word processing, spreadsheets and graphics. A workstation may not always be cost-justified solely for word processing or spreadsheet usage. But because it can also be used to reduce data communications expense, the synergism of multiple uses for the same hardware ultimately justifies the initial expense.

In the final analysis, the 16-bit microprocessor is a computer in its own right. If it is used with that fact firmly in mind, these machines can make a valuable contribution to the overall efficiency and effectiveness of a firm's computing services.

The rationale for introducing microprocessor DDP can be based upon reducing I/O loading on the mainframe, reducing communications costs, maintaining an organizational data standard or allowing the use of new technology without massive retraining. The success of the undertaking ultimately will depend upon a planned approach and a healthy dose of common sense.

IN DEPTH

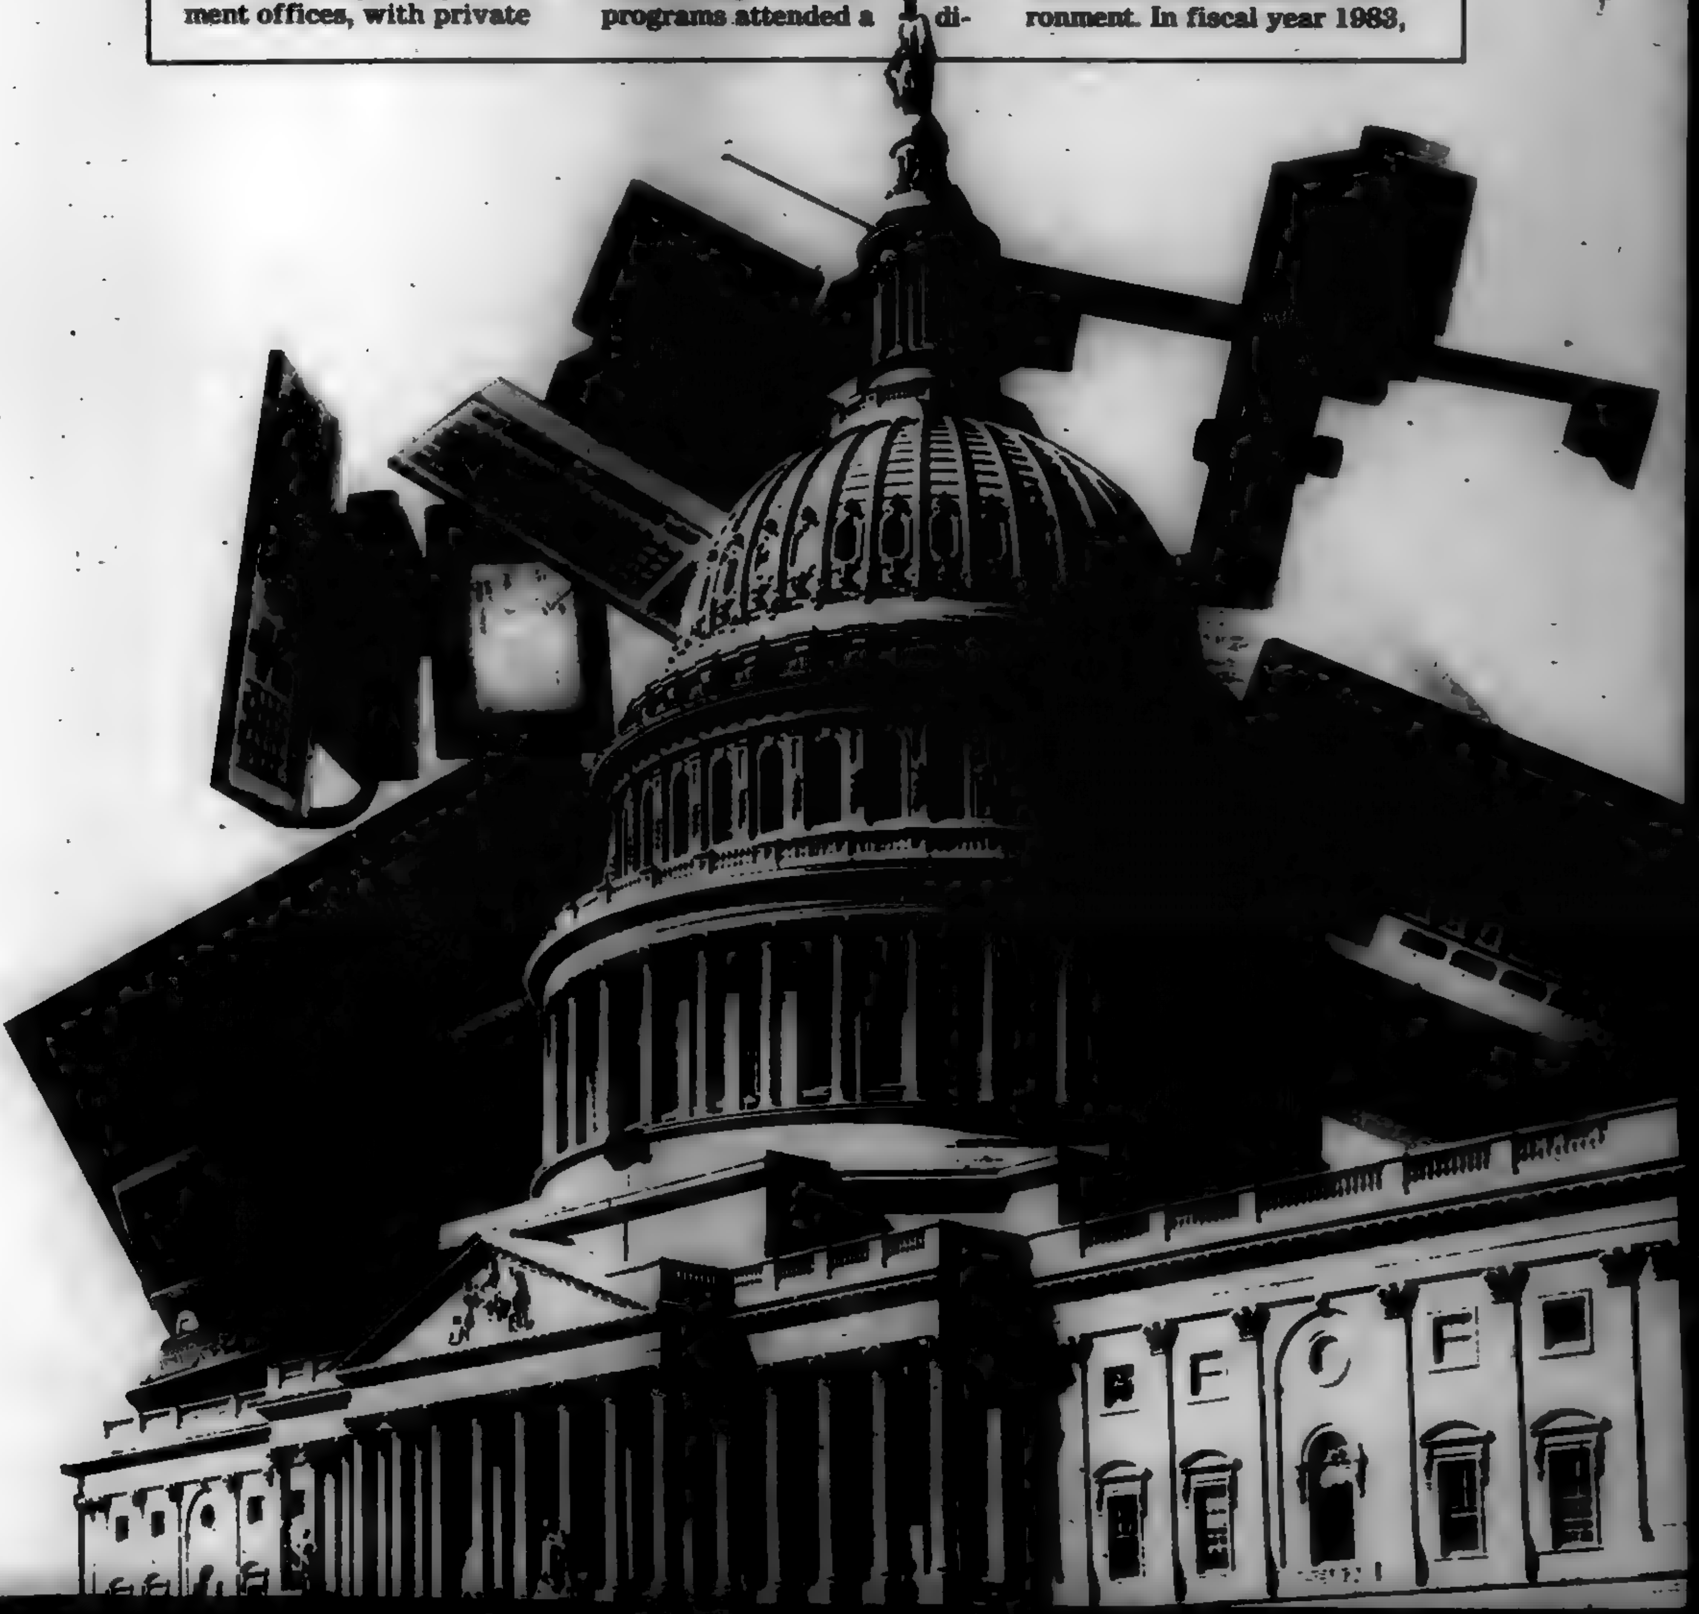
The changing picture of federal office systems

By Charles Guiarson and Cheryl Smith

Federal government office systems are undergoing widespread changes. The trends include larger systems purchases, more single-vendor microcomputer buys, more systems integrator-type procurements, greater integration of micros and increasing incorporation of office systems organizations into information resource management departments. Internal networking is still in the early stages in government offices, with private branch exchange (PBX) systems and broadband networks being pilot-tested more and more frequently.

These were the findings at a special meeting of the federal government office systems program directors at the Federal Office Automation Conference earlier this month. More than 40 directors of major federal OA programs attended a directors' roundtable discussion, which centered on OA policy, planning and implementation.

A lot has changed in the last year. Just one year ago at the 1983 Federal Office Automation Conference, the program directors of more than 30 key government agencies stated that integration of multiple-vendor office systems was a fundamental problem. Integration is still a problem because most agencies have a multivendor environment. In fiscal year 1983,



86% of federal agencies were serviced predominantly by a single vendor, compared with 74% in 1984. Internal networking was a potential solution to integrating multiple-vendor systems. However, less than 10% of the agencies were pilot testing internal networking systems in 1983; less than 50% were even considering the implementation of internal networks.

This year, most major government agencies are considering internal networks, but less than 40% have pilot projects under development. The use of internal networking is expanding but is still not part of the standard federal government agency office system.

The trend is toward broadband networks and digital PBX systems. The broadband systems are concentrated in the defense agencies and civilian agencies that interface most directly with the defense agencies. It appears that most civilian agencies are using baseband systems and reviewing digital PBX systems as a potential method to integrate data and voice system requirements.

Another internal networking trend in the federal government is the linking of microcomputers into terminal or personal computer networks. Hard-wired connections are costly, and long delays are caused when terminals are relocated as organizations change. To avoid this problem, government agencies are implementing permanently installed terminal networks — a single logical network — to link microcomputers and terminals.

Terminal networks provide for low-speed communications between user devices and can be either part of a broadband solution to connectivity or are a separate baseband or twisted-pair solution to internetting terminals. As the organization changes, microcomputers and terminals can be moved along with the personnel and relinked into the centralized or geographically concentrated terminal network.

Other networks being pilot tested in the federal government are office systems networks to integrate minicomputer-type office systems. These networks interconnect the processing and communications components for geographically localized groups of users. They can range from a single physical network serving the entire group to a hybrid office system network composed of several physical networks interconnected to each other via gateways to form a single logical network service.

Another internal networking trend in the federal government is the development of mainframe networks such as Network Systems Corp.'s Hyperchannel. The mainframe network provides a high bandwidth connection between mainframe computers that perform a large number of high-speed, high-precision computations and support large program libraries and data bases. The mainframe network permits the high-speed transfer of files and more timely access to mass storage devices.

The type and structure of the internal network being considered is directly related to the way the agencies are organized and the age and structure of the buildings. In some buildings, the walls are very thick, and it would be prohibitive to install centralized single physical cable-type networks. In these cases, most agencies are reviewing digital PBXs and smaller geographically located networks.

As of this year, more than 90% of all agencies have implemented electronic mail and spreadsheet applications.

If agencies are centralized organizationally and not constrained by building structure, more broadband cables are considered for implementation. In many respects, this is obvious and reflects the characteristics and operating culture of the specific agency. But it is interesting to note that less than 40% of the government agencies have internal networking pilot projects under development.

Applications development

Another interesting trend is the rapid development and implementation of office applications. In 1983, approximately 90% of the agencies had implemented word processing, and about 80% had implemented some sort of electronic mail system. The statistics dropped rapidly in the area of applications usage. Less than 50% of the agencies last year had implemented some sort of electronic spreadsheet.

In 1984, more than 90% of all agencies have implemented electronic mail and spreadsheet applications. In addition, more than 70% of the agencies already installed or plan to implement other centralized administrative support software. This support software includes:

- Electronic filing.
- Electronic calendar management.
- File interrogation and report generator.
- Data base management.
- Dictionary functions.
- Project management and tracking.
- Correspondence control.
- On-line training systems.
- Directory services.

IBM's Professional Office System, Digital Equipment Corp.'s All-in-one, Wang Laboratories, Inc.'s VS Express, Hewlett-Packard Co.'s Desk Manager and Data General Corp.'s Comprehensive Electronic Office are growing in popularity as basic OA

It's how IBM's newest cache makes DASD faster.

To dazzle you with their performances, jugglers anticipate every move of every ball. And now IBM DASD uses anticipation to turn in a nimble performance of its own.

By selecting the data most likely to be needed at the CPU, the new IBM 3880 Model 23 Storage Control Unit can allow DASD subsystems to perform at electronic speeds. A microprocessor dynamically identifies the most active data and keeps it available in high-speed cache storage.

So when the CPU issues a disk read command, many of the responses may actually come from cache. When that happens, mechanical motion is completely eliminated as a factor in DASD response time.

IBM has combined its proven cache storage techniques with high-performance IBM 3380 DASD. This makes the Model 23 the preferred price/performance alternative for many transaction-oriented systems (those running TSO, CICS or IMS, for example) in which I/O activity is limiting CPU performance.

Using the Model 23, you may see one or more of these performance gains: Increased transaction volumes. Higher CPU utilization. Faster response to end users. Shortened batch run times. Or reduced contention for "shared" DASD.

And you may be able to lengthen DASD strings without affecting performance.

This new control unit has 8, 16 or 32 megabytes of cache, using IBM's powerful 256K-bit chip. It offers more speed, lower cost and better reliability.

The Model 23 follows the Model 13 in IBM's family of cache storage devices.

For a free brochure to help you anticipate better IBM DASD performance, just call 1 800 IBM-2468, Ext. 90, or return the coupon. Or call your IBM marketing representative.

Figure 1. Applications implemented in fiscal year '83 compared with '84

end-user tools. They are one reason for the growth in usage of administrative support software. Another reason is the increased usage of these packages in microcomputers. Approximately 50% of the responding agencies have now installed these applications compared with 20% in 1983 (see Figure 1).

Merging text, graphics

One area in the federal government where there has been little applications development is in the graphics area. Most agencies are using standard business graphics software that operates on microcomputers, but few have comprehensive systems that merge text and graphics. However, several agencies have data interchange research experiments under way.

The Department of Defense, in cooperation with the National Bureau of Standards, launched a program to expedite the development and implementation of data interchange standards required in a computer-aided graphics program. Over the past decade, there has been an increasing need to exchange graphics and textual data. The types of equipment would include word processors, electronic typewriters, communications terminals, electronic copiers, character printers, typesetters, graphics devices, computer-aided design systems and many others.

This growing demand for data interchange has led to the formation of the Data Interchange Study Group, under the auspices of the American National Standards Institute, to examine data and data interchange requirements for programming languages, office systems, open systems interconnection, data representation, graphics, data dictionaries and data bases. Initial Graphics Exchange Specifications, Graphical Kernel System, Core, Programmer's Hierarchical Interface to Graphics and North American Presentation Level Protocol Standard are some of the standards under review.

More than 60% of the agencies have a need to merge text and graphics, but additional research and development is required before doing so is cost-effective.

Procurements change

Last year, more than 50% of the federal agencies were planning large office systems buys, and almost 30% were planning large microcomputer buys. Several large microcomputer buys were completed in 1984. The U.S. Navy and the Air Force jointly procured more than 10,000 Zenith Data Systems Corp. 150s (IBM-compatible personal computers) and just recently completed a procurement for Zenith Tempest-certified personal computers. The Department of Defense recently completed a joint service procurement for more than 3,400 IBM Tempest-certified personal computers. The list goes on and on.

A major concern a year ago was that most personal computer buys were stand-alones, and no provision for networking these units was made. This, too, has changed. Several agencies have expanded the procurement requirements to include personal computer-type networks and protocol converters.

"A dynamic trend," according to Randy Ivanciw, who assisted in the development of the Program Directors Roundtable, "is for agencies to avoid the possibility of multiple and noncompatible personal computers by procuring large numbers of units that can be networked."

The procurement trend seems to be in the direction of developing specifications for a central CPU or file server for centralized storage, processing and data base management systems with personal computers serving as multifunctional workstations. It appears that the personal computer, with up to 10M bytes of storage, is quickly becoming the de facto multifunctional workstation for which the government has been looking.

Large centrally controlled office system purchases seemed to be the norm rather than the exception during fiscal year 1984. TRG Washington Group predicts that this trend will continue and increase in 1985. Many agencies choose to avoid

and office processing

the need for

complete records

TRACTS

TRACTS

A MEDICAL RECORDS SYSTEM THAT WORKS JUST LIKE YOUR CENTRAL NERVOUS SYSTEM.

The [illegible] of our central nervous system is that thousands of [illegible] can be [illegible] and stored all at the same time.

Now Honeywell has created a medical record system for hospital administrators that works the same way.

It's a unique combination of office automation, data processing and communications called [illegible] Transcription [illegible] and Chart Tracking [illegible].

Combining the finest medical [illegible]ware with our expandable line of hardware, TRACTS is another unified solution from Honeywell.

TRACTS is built around Honeywell's Office Automation System (OAS), designed to free hospital staffs from redundant and time consuming tasks, while improving speed and accuracy at the same time.

In addition, TRACTS minicomputer operating system GCOS 6 MOD 400, offers a wide variety of data processing options. Data base management systems, high-level language support, custom application programs, and data communications are all part of TRACTS.

The system also supports electronic mail, InfoCalc, file tranfers and an array of other application programs. No other system is so complete.

And when hospitals can operate with that kind of precision, we all benefit from better health care.

Find out more about TRACTS today. Call us at 800-328-5111, Ext. 2747 (in Minnesota, call collect: 612-870-2140, Ext. 2747.) Or write to the Honeywell Inquiry Center, 200 Smith Street, Waltham, MA 02154. We'll be happy to send literature, discuss the system with you, and even arrange a demonstration.

L

Together, we can find the answers.

[illegible] handle many office processing functions [illegible] automatic generation of correspondence.

Parameter driven TRACTS system can be tailored to meet specific requirements.

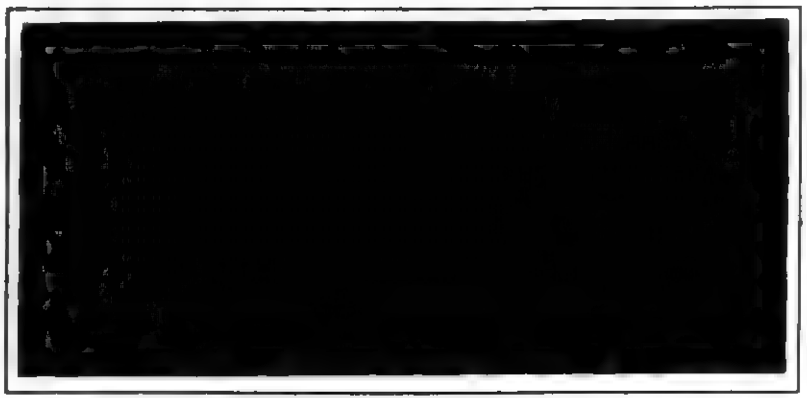

Figure 2. Major issues and concerns

interoperability and interconnectivity problems by standardizing on single vendors or multiple vendors with very specific communications protocols: the Intelligence Community and State Department field offices on Wang, the Forest Service on Data General and the Treasury Department Headquarters on DEC.

Procurements are now more functional-specification rather than hardware-specification-oriented. Procurements include the full range of functional requirements, including software (both system and application software capabilities), maintenance, end-user training and systems engineering support.

As experience grows in OA procurements, a lesser emphasis is being put on just the hardware costs. It appears as though the 100% hardware with 100% cost procurements are gone. Too many agencies have been stung by procuring the least expensive hardware buy. It appears cost-effective, but it couldn't be further from reality.

Today's more progressive agencies look toward life cycle cost — the cost over the life of the project. This means that the total cost to implement a system is being evaluated. More agencies want one contracter to provide the hardware and the software required to automate the major functions of the agency, maintain the system, train the end users and resolve any interface issues necessary to make the system fully operational.

In fiscal year 1983, the agencies talked about this concept; in fiscal year 1984 they did something about it, and in fiscal year 1985 it appears as though it will be standard operating procedure.

Organizational aspects

Information resource management (IRM) has been in effect for more than a year. It appears as though IRM departments are more and more responsible for office systems, but the culture or nature of the IRM department is changing. One year ago, data processing professionals did not have an appreciation for the role OA had in information management. That is rapidly changing.

The merging of the information technologies — data processing, records management, communications and OA — is affecting every federal agency. While each agency is addressing the blend of technologies and procedures of IRM differently, they are addressing them in a more structured, comprehensive approach.

OA procurements now include the communications requirements, interoperability with the agency's mainframes requirements and records storage capabilities that were often missing in the specifications a few short years ago.

The major issues and concerns of organizations have shifted from funding to cost/benefit analysis and the technical problem of interfacing to the agencies' mainframes. Figure 2 depicts this shift. The shift will influence the internal structure of IRM organizations.

The federal government has been accused of being behind private industry in the development of complex office systems. Nothing could be further from the truth. At the Program Directors Roundtable at the 1984 Federal Office Automation Conference, more than 45 representatives from approximately 35 key agencies and subagencies discussed how to implement office systems on a cost-effective, productive basis in the federal government.

The trends revealed that the federal government is moving rapidly toward larger, more centrally administered procurements of compatible systems, more microprocessor-based systems, more broadband and digital PBX-based communications capabilities, more integration of text and graphics and more integration of voice and data. One thing is clear: Leading government agencies will be a significant force in the setting of standards for office systems in the second half of the '80s.

About the authors

Charles Gularson was industry chairman of the Federal Office Automation Conference held in Washington, D.C., Nov. 6-8 and moderator of the Office Automation Program Directors Roundtable, where he presented his survey results. He is president of TRG/Washington Group, Inc. in Falls Church, Va.

Cheryl Smith is director, advanced office systems, of TRG/Washington Group.

[illegible] world's most advan[illegible]
[illegible] printer, you'll have [illegible]

The TeleVideo 750 letter quality printer is nothing [illegible] of revolutionary. In design. And in price.

Because the 750 delivers 50 CPS performance [illegible] incredible 40% fewer parts than any comparable printer. It's not mere coincidence that the 750 sells for up to 40% [illegible] as well.

Cost of ownership gets even better with time. Fewer parts equal more reliability: an average of 65,000 pages between failures. And with the works in a drawer, repairs—when necessary—are quick and easy.

Fewer parts also equal a low profile, small footprint, and light weight. The 750 printer is plug compatible with virtually any personal computer, mini, or word processing system. And TeleVideo provides a complete selection of supplies and paper handling accessories.

Who Are End Users?

By Leilani Allen

More than ever before, businesses need an experienced professional to plan for meeting end-user service needs with optimum capacity at reasonable cost. This function will be the province of the information engineer.

Users in 1990 may be classified in three general categories, based on different sets of needs and problems that require different systems solutions. These categories are; central site users, remote users and telecommuters. The categories, in turn, may be subdivided into classes.

The information engineering needs of each subgroup are assessed according to four information areas: processing, storage, transfer and management. The following groups come under the category of central site users:

Clerical. Among information users, this group is still likely to be the largest. Its needs are probably easiest to assess. Typical applications will continue to be data entry (especially the feeding of production information bases), information base inquiry and update, report production and (to a more limited extent) word or text processing.

This work will require massive amounts of storage (both direct-access storage devices and mass storage devices). Processing will still be done largely on the mainframe, although some word processing and ad hoc report writing may be transferred to multiuser, mini or micro configurations.

> ***The challenge for the information engineer is to see beyond the broad label "users." Then he can match technical support to individual needs and wants.***

Transfer capabilities will not be especially significant, since this type of user will generally experience information coming to him, in the form of customer phone calls or invoice records. However, there may be some element of data transfer from automatic scanning devices (such as for inventory applications) or in batch mode from outlying sites without their own processing capabilities.

The management component will concern itself with production information base design and maintenance, data security, update standard enforcement, backup and recovery. Sophisticated, real-time performance monitoring, analysis and diagnostic tools will also be essential.

Professional. IBM estimates that by 1990, 50% of all professional workers will have direct access to the computer system. International

IN DEPTH

Data Corp. puts the figure at 65%. This class includes analysts and managers of all types, engineers and programmers. Typical applications will be spreadsheet and statistical analysis, modeling, graphics, computer-aided design and text processing. The majority of processing will be done on micros and minis, with the ability to download data from the mainframe. With the exception of computer-aided design and manufacturing, incremental storage requirements will be fairly negligible, and transfer requirements will be confined primarily to electronic mail and access to external information sources via time-sharing vendors.

Management issues will include data handling protocols, the enforcement of design standards and integration of information bases. Capacity management will be particularly crucial because this type of work tends to grow in a volatile and significant fashion. Analysis of employee productivity, particularly the relationship between given levels of response time to productivity, will be a major focus.

Executives. There is no question that this group will experience increased hands-on use of the computer. However, few executives will use the computer as their most trusted or most frequently accessed information source. It is interesting to note that much of the current discussion of computer tools for executives centers around the need to provide executives with direct access to the production information bases. This need is based on the assumption that executives will want to enmesh themselves in detailed data manipulation and analysis. Yet executives themselves are far more interested in the big picture.

Access to production information base data will, in all likelihood, be provided by means of daily summary files created by subordinates that can be downloaded to the executive workstation. There, a sophisticated decision support system interface will use the data to update a variety of "canned" graphical and report formats that have been customized to the executive's preferences.

Rather than learning programming syntax and commands, the executive will merely type one character (for example, "S" for "sales report") or point to a report icon on the screen. The program will then show the executive the latest indicators and a variety of "what if" scenarios based on preprogrammed assumptions.

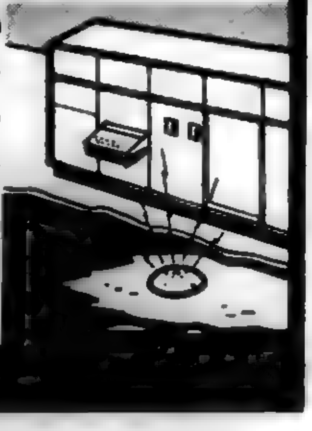
Storage and processing requirements will be minimal. They will be handled by a microcomputer, although the initial preprocessing of the summary data will be done by extraction routines on the mainframes, both central and remote. Transfer will involve shipping the summary data only.

Management requirements will include stringent provisions for data integrity and security. Initially, a high-level analysis of the executive's information needs will have to be performed, most likely using many of the techniques developed in expert systems research. Indeed, the advancement and spread of artificial intelligence and expert systems design methodologies will probably be most fully exploited in the commercial sphere in the creation of executive user interfaces. Ongoing consulting/programming assistance will also be required as information needs change.

Industrial. This will also be a relatively new group of users. It will include workers and supervisors in a wide variety of manufacturing-related roles. Typical applications include inventory control, production control, fault-testing, robotics, inspection, problem diagnosis and repair.

Processing will largely be done on the mainframe and will require a large amount of storage. Once again, expert systems technology will be useful here, as the relevant information about each failure/problem is captured and stored in the knowledge base, which in turn can be accessed and analyzed by problem processing systems. Even if this level of sophistication is not possible, a historical file of incidents will be maintained as a guide for appropriate

AVOID DOWNTIME!
WATER ALERT
. . . FOR COMPUTER AREAS



Warns you of water leakage in sub-floor wiring areas.

- Produces a loud, intermittent alarm when activated by presence of water.
- Completely self-contained . . . no wiring, no connections.
- Early water detection (1/64" water film activates alarm) provides maximum time for corrective action.
- 24 hour per day monitoring.
- Options include remote indicator, remote flashing light, and automatic telephone dialer.

8 Models from $89 - $110

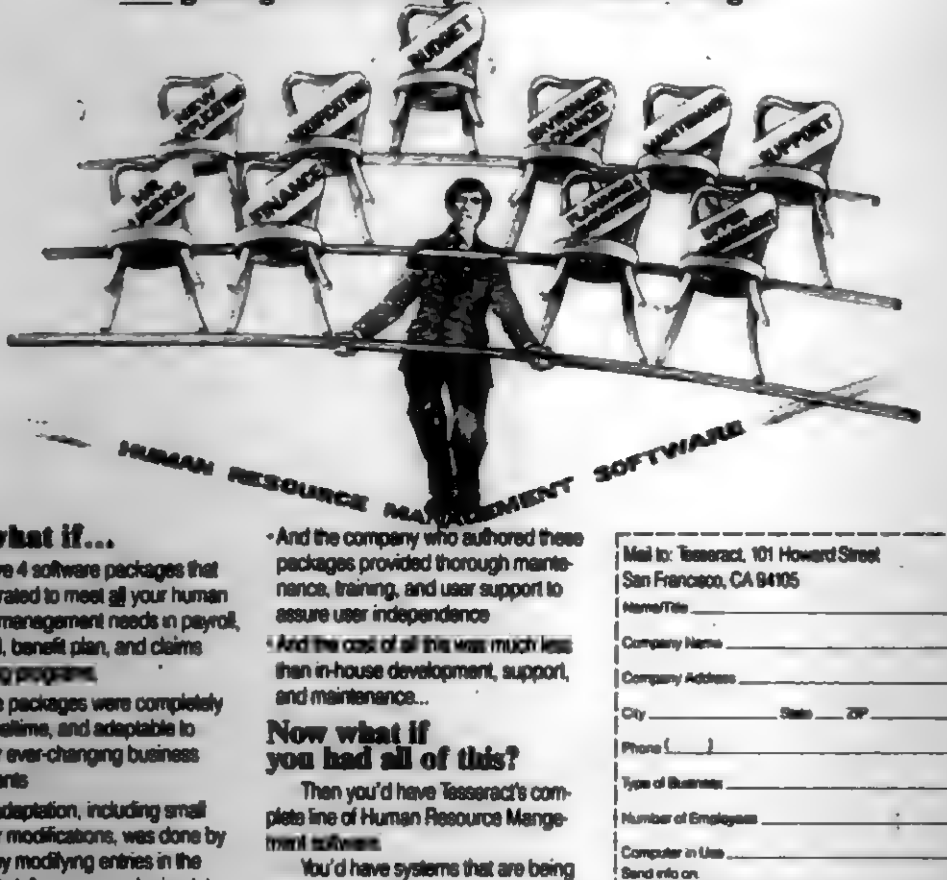
Dorlen Products

When it comes to the demand for human resource management software, data processing has a problem...

A problem of balancing everyone's needs
and getting the over-all job done within budget



Now what if...

- There were 4 software packages that fully integrated to meet all your human resource management needs in payroll, personnel, benefit plan, and claims processing programs.
- And these packages were completely on-line, realtime, and adaptable to meet your ever-changing business requirements
- And this adaptation, including small and major modifications, was done by the user by modifying entries in the tables that define program logic, data structures, etc.
- And these packages operated with all major DMBS' and TP systems common to IBM and IBM compatible mainframe environments
- And these packages could quickly adapt to new environmental offerings such as IBM's DB2
- And the company who authored these packages provided thorough maintenance, training, and user support to assure user independence
- And the cost of all this was much less than in-house development, support, and maintenance...

Now what if you had all of this?

Then you'd have Tesseract's complete line of Human Resource Mangement software.

You'd have systems that are being used by almost half of North America's largest companies.

And you'd finally have the solution to the never ending problem of balancing HR user needs with the needs of the rest of your organization.

STOP WALKING THE HUMAN RESOURCE MANAGEMENT TIGHT-ROPE. Call us today or send in the card. (Call 415-543-9320 and ask for Robin Curle, VP Sales)

New Kodak Reliant intelligent microfilmer 2000

New Kodak IMT-250 microimage terminal

These new micrographics units speak your language. Kodak put a microprocessor in each of them and programmed them to communicate, not only with each other, but with their operators.

They monitor themselves continuously. Stop if something goes wrong, then tell the operator, in plain English, how to make it right.

Programmed to do work your way, they file and find documents as fast as electrons can travel.

© Eastman Kodak Company, 1984

Matter of fact, they're the fastest, smartest, most accurate image management machines we've ever made. That's why we call them The Whiz Kids.

To apply their intelligent conversation, unerring accuracy and laser-like speed to your information handling needs, return the coupon.

Kodak's fastest and smartest.

action. Transfer requirements will be negligible for the centralized manufacturing installation.

Management requirements are similar to those of the production information bases but with less stringent update protocols. Education of industrial users will be a key information management element, largely because this group of users has had far less exposure than clerical workers to computer equipment and possesses minimal keyboard skills. As a consequence, voice and image recognition capabilities will be the most important technical enhancement for hardware used in industrial settings.

Remote users

Office staff. Remote offices may be viewed as containing a smaller representation of each of the central site components. Many of the applications will (in fact, must) be identical to those at the central site. However, transfer of information will be a much more crucial element.

Processing will be handled largely by powerful (1M- to 2M-byte) microcomputers with hard disk storage capabilities. Selected data from these individual machines may then be loaded to a local minicomputer, that in turn will be linked via high-speed line to the central site mainframe. The sequence of the transfer process and the regulation of precisely which information will need to be forwarded on to other locations will be a key management issue.

Also, remote education and technical consulting capabilities will be required. Because of the expense and administrative problems associated with maintaining large training staffs in multiple locations, computer-based or computer-aided education will be the primary vehicle for providing expertise to the remote sites. The final management element will be decentralized network performance monitoring and problem diagnosis.

Field. One of the most interesting of the new classes of users will be personnel in field locations. The oil and gas industry, in particular, will need to support decision making at drill sites, off-shore oil platforms and producing fields. The construction industry will also see increased use of technology-supported test and inventory control activities in remote sites. Rugged, portable terminals capable of accessing specialized information bases will be increasingly evident.

Thus, a crew confronting an engineering problem could enter the indicators into the terminal and have that data analyzed by expert-systems software to get advice on how to proceed. The time-consuming and costly delays associated with tracking down a human expert to analyze the problem and then try to relay that information over the phone could be virtually eliminated.

Processing responsibilities will be shared between the portable terminals and the central or regional mainframe. Incremental storage requirements would be minimal since most of the transactions would be one-time or ad hoc in nature and would not require significant post-processing or analysis. The transfer element will be significant, probably involving the use of built-in modems and dial-up facilities. Again, depending upon how remote the field locations were, local-area network facilities might serve as the transfer medium.

> ***The time-consuming, costly delays associated with tracking down an expert to analyze the problem and then trying to relay that information over the phone could be virtually eliminated.***

The management issues would be security, the selection of appropriate network architectures and, of course, field training. Also, the physical maintenance of the machines themselves will have to be addressed.

Customers. Once again, this represents a relatively new group of users.

Banks, insurance companies, retail stores and other consumer-driven industries are realizing that to stay competitive in the '90s, they will have to reduce the labor component in the services they provide. Giving customers direct access to information bases is one major way to achieve this goal. Automatic teller machines, home banking, automated check-in terminals at car rental agencies, shopping at home via converter boxes on home TV sets — all of these will become widespread in the next few years, especially in major metropolitan areas.

This past February, IBM, Sears Roebuck & Co. and CBS, Inc. announced a joint venture to develop a nationwide commercial videotex service for households with computers. J.C. Penney, Citicorp and American Express have also expressed interest in this technology. One industry expert predicts that videotex could be a $30 billion industry by the mid-'90s.

Processing will take place largely on the mainframe, although there may be minimal intelligence at the node. Storage requirements may be quite significant, especially to hold large customer archive files. Information from these files will be intensely analyzed to support future marketing strategies and will constitute a major information asset.

Until now, if you wanted in-depth editorial on today's hot issues, one thing's been missing.

FOCUS

INTRODUCING COMPUTERWORLD FOCUS. A new breed of publication with in-depth information on today's hottest topics. It's called Computerworld Focus. And it just may be the brightest, smartest, most efficient way you'll ever reach your customers and prospects.

Computerworld Focus is issued 10 times a year – with the express purpose of analyzing the hottest topics of the day. Not just lip-service, but in-depth editorial, expert views, user opinions, market research facts, analyses, predictions and more.

Who can you reach with Computerworld Focus? Hundreds of thousands of your prospects and customers. Start with Computerworld's over 126,000 paid subscribers, then add high pass-along readership, plus bonus distribution at major trade shows.

Since each issue is devoted to a specific topic, you can target your media buy better than ever before. And with help from our Starch issues, you can even evaluate the effectiveness of your ads.

So take a look at the topics we'll be dealing with. Then clear the decks for some of the most cost-effective advertising you'll ever do.

SPSS PC

SPSS inc.

Transfer will also be a significant and costly element, primarily because of the need for leased lines. Management issues will predominate. These issues will range from privacy and security concerns to backup, recovery and equipment repair to maintain stringent availability standards.

Telecommuters

This final major category will be the most diverse group of all. It will include permanent and part-time employees working at odd hours and accessing a wide range of information sources.

Sales. New technical developments will allow the traveling sales representative to achieve a higher level of communications sophistication. Portable computers will be used for everything from typing up the notes of a meeting to dialing up a home-office computer to demonstrate product features. The sales representative might also use a portable to call up needed information (such as current delivery schedules, price quotes, discount or financing options). Instead of leaving brochures, the representative might leave a complete, customized proposal.

These developments should help shorten the overall sales cycle and enhance the revenue-generating ability of a sales force. In addition, the portable terminal could transmit updated sales or forecast data directly to the home or regional office, thereby improving communications between management and its sales operatives. This development may also reduce the amount of clerical support required at field sales offices since contracts could be generated by computer as well.

Cellular radio systems in large metropolitan areas will finally make car phones feasible, allowing sales representatives to stay in touch with their customer bases and significantly reducing telephone tag, which is frustrating and unproductive.

Word processing and financial analysis could probably be handled by the portables directly, with the more sophisticated demonstrations and inquiry processing handled by regional minicomputers or central-site mainframes. Storage requirements will be minimal. Transfer capabilities could be handled with a local-area network architecture or simple dial-up lines. The key management issues will, once again, be security (contract and pricing information is highly confidential), education and equipment maintenance.

Working parents. Two of the most interesting developments of the last decade have been the vastly increased number of mothers with careers and fathers who wish to play a more active role in the care and raising of children. By the end of the decade, it will be increasingly common to see one or both spouses working primarily from the home.

These working parents will largely be professionals, simply because executives are involved in too many meetings and other face-to-face activities to make telecommuting feasible. Industrial workers are still required to be physically situated in the production environment, and the costs of allowing clericals this work option will probably be viewed as prohibitive. However, the typical white-collar employee usually does a good deal of work in isolation and is far more likely to interact directly with an information base of some kind rather than numerous peers or higher-ups.

Programming, technical documentation, computer-aided authoring systems, financial modeling, credit and brokerage functions — all can be successfully carried out with a telephone and computer at home. The working parent could take care of household chores, dial up the mainframe and

BUILT-IN PIN FEED FOR CONTINUOUS FORMS PRINTING
OVER 500 INTERCHANGEABLE DAISY WHEELS AVAILABLE
AUTOMATIC SHEET FEED BUILT IN
SHORT PAPER PATH INCREASES RELIABILITY
COMPATIBLE WITH IBM PC'S, AS WELL AS WITH MANY OTHER MICROCOMPUTERS

The new IBM Wheelprinter: A simpler path to letter quality.

The new IBM Wheelprinter is a personal computer printer with a simplified approach to paper handling.

This new IBM personal printer is the only daisy wheel printer that offers both a built-in sheet feed and pin feed capability. It's the latest example of IBM's expertise in the design and manufacture of reliable paper feeds.

Because it has a paper tray capacity of 100 sheets, large jobs can be printed without reloading. And, at the flip of a switch, you can go from automatic to manual sheet feed.

The Wheelprinter prints quietly on plain paper, letterhead, multi-part forms and even envelopes at up to 25 characters per second. And you can easily attach it to IBM personal computers and to many other microcomputers.

The Wheelprinter is just one example of the more than 70 printer models we build. But they all serve a single purpose: To make your printing as effective as your processing. To give your work the finishing touch.

Contact your IBM marketing representative or call 1 800 IBM-2468, Ext. 90/3W, for the IBM Product Center or authorized IBM dealer nearest you.

IBM

IBM PRINTERS

The Finishing Touch

ask for information to be loaded to his micro and begin the day's analyses. Work might stop when the children return home from school and resume again after dinner. The resultant updated material could be placed in a file to be transmitted to the mainframe during off-peak hours (say, after Johnny Carson or at 7 a.m. while packing the school lunches).

Apart from improving productivity and employee morale, this option offers intriguing capacity management opportunities in terms of work scheduling. The important management issues will primarily be security and integrity of information bases, backup and recovery of home-based systems (what happens when the home hardware breaks down?), the enforcement of data standards and availability of help and consulting facilities to support the home user.

Consultants. One element in today's labor market that is drawing increased attention is the widespread use of consultants as a supplement to, or substitute for, permanent staff. The tremendous rise in the cost of benefit packages and of real estate, as well as an increasingly volatile economic situation, have forced many companies to look long and hard at personnel increases.

Consultants offer a corporation a great deal of flexibility in fulfilling short-term requirements or compensating for real or imagined inadequacies in staff training or capabilities. Complementing this corporate need is an increased entrepreneurial spirit among today's middle managers and senior analysts. These people are attracted by the financial and tax advantages, personal autonomy and growth opportunities that having one's own business presumably offers.

Consultants may not require office space, retirement plans or secretarial support. However, they will require access to corporate information bases. Indeed, the overwhelming part of a typical consultant's job (and, naturally, the biggest component of the fee) is data collection. Streamlining this task will not only allow more time to be spent on solid, site-specific analysis (too often missing from many final reports) but will also allow the client more frequent (perhaps daily) updates as to the contract's progress. Also, allowing the consultant to use client information resources and facilities may result in recommendations that are more feasible.

From an engineering standpoint, consultant processing, storage and transfer needs will be very similar to that of the working parent, although they will be more likely to require access to many different information bases and external time-shared services, depending on the nature of the task. Security and privacy will, once again, be key management issues, and stringent controls will have to be implemented to ensure the proper handling (and perhaps eventual destruction) of confidential information.

Industry trends, technological developments, government regulations, consumer attitudes — all of these are large unknowns. Yet all will affect working people. The challenge to the information engineer is to determine who those people will be, what they wish to do and how they can most productively do it with the best the technology has to offer.

DEC launches LN03 desktop laser printer

LAS VEGAS — Digital Equipment Corp. last week introduced a desktop laser printer that prints eight page/min and carries a $4,195 price tag.

DEC's LN03 can produce 300 dot/in. for text, twice the density of standard dot matrix printers, according to DEC. The LN03 also is said to produce simple business graphics with resolutions up to 150 dot/in.

Resident fonts allow the LN03 to print up to 120 char./line in the vertically aligned portrait mode and up to 150 char./line in horizontal landscape mode, according to the vendor. The printer's input cassette and output tray each hold up to 250 sheets of standard letter-size paper, DEC said.

The device is said to support both single-user and multiuser printing configurations. "A dedicated LN03 offers the single user the ability to add fonts by plugging in [read-only memory] cartridges," said Bruce Hunter, product marketing manager for DEC's Terminals Business Unit.

"When the LN03 is used as a shared resource, [random-access memory] cartridges are plugged in, and the host system down line loads fonts to the printer's expanded memory," he said.

The LN03 is driven by an on-board controller and has a serial interface with a selectable bit/sec rate of up to 19.2K, DEC said. The printer is said to be compatible with many applications written for DEC's LQP02, LA100 and LN01 printers.

Deliveries of the new desktop printers are scheduled to begin in February, according to the firm.

DEC is located in Maynard, Mass. 01754.

TI laptop, designed for mobile professionals, available soon

AUSTIN, Texas — Texas Instruments, Inc. last week introduced Pro-Lite, a 10¼-lb portable version of the TI Professional Computer, designed for mobile professionals and available in January for $2,995.

Pro-Lite reportedly features a 12-in. LCD with an 80-col. by 25-line display in text mode and a 640- by 200-pixel resolution (scrollable to 720 by 300 pixels) in graphics mode. Based on an 80C88 microprocessor (the Cmos version of Intel Corp.'s 8088), the Pro-Lite includes 256K bytes of random-access memory (RAM), expandable to 768K bytes; a 79-key, full-size keyboard; and a single 3½-in., 720K-byte microfloppy disk drive.

Pro-Lite runs under Microsoft Corp.'s MS-DOS 2.12. Approximately 30 packages will be available in microfloppy format in first-quarter 1985. These will include applications such as Ashton-Tate's Framework and Dbase-III, languages and vertical-market software, TI said. Other packages licensed on a single-user basis can be downloaded from a desktop Professional through a $75 interface cable, which also can transmit data files from IBM Personal Computers, according to the vendor.

The 768K-byte RAM capability, greater than that provided for most computers running MS-DOS, "will allow Pro-Lite to take advantage of future expert systems and natural language products," TI said.

A battery pack or second microfloppy disk drive, or both, can be added through an expansion box that plugs into the Pro-Lite's back, according to the vendor. The battery pack allows operation of up to five to eight hours and

IBM-compatible Radio Shack micro bundled with application software

By Kathleen Sullivan
CW West Coast Bureau

FORT WORTH, Texas — Radio Shack Corp. a division of Tandy Corp., this month introduced the newest member of its Microsoft Corp. MS-DOS family of personal computers, the Tandy 1000, a floppy-disk-based system that includes bundled applications software.

The Tandy 1000, which uses the Intel Corp. 8088 microprocessor, is "close to 100% compatible with the IBM Personal Computer," said Ed Juge, director of market planning for Radio Shack.

The Tandy 1000's bundled applications packages, known as Deskmate, feature a variety of software programs, including text processing, spreadsheet, data base management, calendar and electronic mail.

Juge described the Deskmate ap-

See TANDY page 62

Current well-behaved packages leave user dreams unfulfilled

SMALL TALK
Eric Bender
CW Senior Editor

Today's "well-behaved" personal computer packages play by the rules of Microsoft Corp.'s MS-DOS, docilely going through the operating system every time. They're like well-behaved storybook children, running around everywhere and never getting messed up. They play on networks, in windows, in operating system environments and wherever else they please.

Among the drawbacks in this happy scenario, of course; well-behaved programs tend to be slow and not very interesting.

Best-selling packages such as Lotus Development Corp.'s 1-2-3 generally are ill-behaved Peter Pans rather than Wendys. They bypass the operating system to grab the hardware directly, achieving strong performance advantages.

However, you take your chances introducing them into a new environment. The most striking recent case is the host of best-selling IBM Personal Computer software that's not quite ready for prime time on the Personal Computer AT.

Things get further complicated, naturally enough, under new system software environments such as IBM's Topview or Digital Research, Inc.'s Graphics Environment Manager (GEM).

These new environments potentially offer users jazzy features such as mice, icons and windows and a lot of other benefits as well. And system software vendors say their goals include a way for applications developers to create well-behaved programs that run without modification on every MS-DOS machine, avoid paying any penalties in performance or functionality and benefit fully from the system software features.

But most application software vendors are wary about customizing their products. They are looking at multiple environments — Topview,

See BEHAVE page 62

Analyst says IBM's OA strategy augurs ill for marketplace rivals

By Edward Warner
CW Staff

BOSTON — Office automation consultant Amy D. Wohl thinks IBM's recent introduction of high-powered word processing software for its Personal Computer is "formidable," and that Apple Computer, Inc.'s "take-a-Macintosh-home" promotion will not generate sales to corporations.

Wohl expressed these thoughts during a speech and an interview at the East Coast Computerfaire, a personal computer show here this month.

Wohl, who operates Amy D. Wohl & Associates of Bala-Cynwyd, Pa., predicted that IBM's offering of Displaywrite III for the Personal Computer and Displaywrite 36 for its System 36 minicomputer, with smooth transfer of documents between the two systems, will make things tough for competitors, especially Wang Laboratories, Inc.

Wohl, however, said IBM has yet to offer the business graphics or project management software that she feels are needed by a well-rounded OA vendor. The firm, she added, does possess a competitive advantage in its Topview operating environment.

IBM's internally announced goal, she claimed, is "to own 65% of the Personal Computer market." The most likely way for them to do that, she continued, is by "making certain features that are very attractive only available to those who use its products."

A study by her firm, she noted, found that 88% of the corporations it surveyed required that their personal computers have Microsoft Corp. MS-DOS operating systems, for IBM Personal Computer compatibility. She added that 72% of the firms made IBM's PC-DOS an outright requirement, limiting purchases only to IBM equipment.

Apple Computer's Macintosh, currently being offered for overnight free trial to anyone holding a major credit card, has failed to crack the OA market, she claimed, because it lacks software.

The OA market is not closed to the arrival of a new vendor, she observed, adding that the likely candidate will be a Japanese firm marketing its hardware through the existing channels of an American vendor who is "product bankrupt, but has a strong distribution scheme."

Novell offers software for Netware local-area networks

OREM, Utah — Novell, Inc. has introduced Advanced Netware 1.0, local-area network operating system software that is said to support the use of multiple file servers on all Netware local-area networks and transparent bridges between these networks. It also reportedly has the ability to access special-function network servers.

Advanced Netware gives every user access to eight servers simultaneously, with storage capabilities up to 500M bytes per server, according to Novell.

Netware bridges essentially act as servers and communicate through a normal local-area network link, the vendor said. Reception and transmission are said to be completely transparent to the user.

The bridges reportedly also allow a personal computer to access the network from remote locations in either remote or local execution mode.

Remote execution "provides actual distributed processing by transferring applications programs and their data via modem for remote execution at the bridged personal computer," according to the company. This feature is said to give the remote personal computer all the capabilities of a local node. In local execution, only screen and keyboard information is transmitted to the remote personal computer, Novell said.

Using Novell documentation, managers can write the software necessary to accommodate special functions on a value-added server, and those functions will be fully integrated into the local-area network, according to the vendor.

Advanced Netware, which may be adapted to all Netware networks, is priced at $1,595 and will be delivered by January, Novell said.

Novell is located at 1170 N. Industrial Park Drive, Orem, Utah 84057.

TI

from page 57

costs $129. The second disk drive is priced at $595, while the two options together carry a $724 price tag.

Internal option slots

A 300 bit/sec internal modem, priced at $300, is said to plug into one of the Pro-Lite's two internal option slots. The other slot can accept an RS-232 interface, an external monitor adapter or programmable read-only memory modules provided for specific applications, according to TI.

A 12-in. external monochrome monitor costs $325, while a color monitor is priced at $695. An optional 45-char./sec thermal transfer printer handles either plain or thermal paper and costs $499.

Initially, TI will sell the Pro-Lite through direct and value-added reseller channels.

Data base program bows for IBM micros

CAMBRIDGE, Mass. — Infocom, Inc. has introduced a relational data base program for IBM Personal Computers said to be designed for nonprogrammers.

Cornerstone is designed for business professionals who need a data base for individual applications such as tracking sales leads, customer support and personnel management, Infocom said. According to the vendor, Cornerstone enables a nonprogrammer to create a data base by answering a series of simple questions.

The program is said to feature an interactive report writer that can draw information from any file or combination of files. It also allows users to add notes or comments to a file at any time, the vendor said.

Cornerstone includes a Help facility and an options feature, Infocom said. The options key shows the user exactly what to type next, whether it is a command, file name or item in the data base, the vendor said.

The program is available for the IBM Personal Computer, Personal Computer XT, Personal Computer AT and compatibles. It can be used in conjunction with packages such as Lotus Development Corp.'s 1-2-3 and Micropro International Corp.'s Wordstar, as well as other spreadsheet and word processing programs. The price is $495.

Infocom is at 55 Wheeler St., Cambridge, Mass. 02138.

Orchid adds products to PCnet

FREMONT, Calif. — Orchid Technology has introduced several products for its PCnet local-area network for the IBM Personal Computers, including Lancomm, which reportedly allows dumb terminals on PCnet to function as intelligent workstations when linked with an IBM Personal Computer.

Lancomm reportedly allows Personal Computers on PCnet to support two dumb terminals simultaneously, with each terminal having full access to the network and its shared resources.

Also introduced for PCnet were PCnetmail, an electronic mail software package, and Command Spooler, a print spooler for the network, according to Orchid Technology.

PCnetmail reportedly offers store and forward functions and automatic remote networking communications. Command Spooler reportedly allows PCnet users to share one to three printers connected to their machines with other users or servers.

Prices for the products are: Lancomm, $395; PCnetmail, $695; and Command Spooler, $195.

For more information, Orchid Technology is located at 47790 Westinghouse Drive, Fremont, Calif. 94539.

NEW LIFE FOR
1401 PROGRAMS

CS-TRAN converts your 1401 OBJECT programs to COBOL for the mainframe or mini of your choice.

CS-TRAN is the ONLY translator that accepts your OBJECT programs, patches and all, yet allows you to include actual COBOL paragraph names and record definitions.

If you'd like more details about new life for your 1401 programs just call or write:

Anything less than a complete solution is no solution at all.

So why use anything less than Motorola/Four-Phase?

One third of the Fortune 500 relies on office information systems from Motorola/Four-Phase. When these companies need office information systems, they can't settle for partial solutions. They demand it all—hardware, software, service, leadership. All vital elements of the complete system solution. Few suppliers can meet that demand, year after year. Motorola/Four-Phase can.

Solution Part One: Hardware

Motorola/Four-Phase has been setting milestones in advanced hardware development for over 15 years. We pioneered distributed data processing in 1971 when we introduced the first all-LSI computer. Now, with our new 2000 and 6000 Series, we're among the first to incorporate the powerful Motorola MC68010 microprocessor. We provide complete systems—processors, workstations, communications and peripherals.

Solution Part Two: Software

We've invested the necessary resources to bring you one of the largest software product lines in the industry—a multitude of tools, languages, and applications programs. Software designed to provide reliable, high-performance solutions, like advanced interactive processing provided by VISION®; and user-friendly access

provided by our UNIX*-based UNIVIEW.™ We've designed our software to help you make maximum use of our systems.

Solution Part Three: Service

Other office system suppliers have tried to emulate our award-winning Customer Support Operation. That's understandable. It's a centralized service, communications and dispatching facility that operates 24-hours a day, every day of the year. We give you hardware *and* software technical support with one phone call. You can expect quick hands-on help from any of our 1400 customer support specialists located throughout the country.

Solution Part Four: Leadership

Motorola is a world leader in advanced electronic technology. Businesses of all kinds depend on our long-term commitment to provide innovations in microprocessors, electronic communications equipment and office information systems. We meet your information processing needs today—and tomorrow, with increasingly sophisticated solutions.

Nothing less than a complete systems solution.

Before you decide on your next office information system, consider the difference between a complete solution and no solution at all. Contact Motorola/Four-Phase today at 1-800-528-6050, ext. 1599. In Arizona, call 1-800-352-0458, ext. 1599. Or write us at 10700 North De Anza Blvd., M/S 52-3B1, Dept. S, Cupertino, CA 95014.

SOFTWARE

BV ENGINEERING
PC Plot

BV Engineering has announced PC Plot, a graphing program that is said to create linear, semilogarithmic and full logarithmic plots in any combination of the X and Y axes.

PC Plot requires 64K bytes of memory and runs on microcomputers including the IBM Personal Computer, Zenith Data Systems Corp. 100 and 150, Corona Data Systems, Inc. Corona PC and on micros from Compaq Computer Corp. and Columbia Data Products, Inc.

The price for PC Plot is $62.95.

BV Engineering, Suite 207, 2200 Business Way, Riverside, Calif. 92501.

WARNER SOFTWARE, INC.
Desk Organizer

Warner Software, Inc. has announced that its Desk Organizer software is available for microcomputers running Microsoft Corp.'s MS-DOS operating system and for the Apple Computer, Inc. Macintosh.

Desk Organizer reportedly is used in filing, organizing notes, telephone dialing, writing and printing, calculating, transferring data and managing time.

The MS-DOS version will run on the IBM Personal Computer, Personal Computer XT, PCjr, Personal Computer AT and compatibles, the vendor said. The MS-DOS version requires a minimum of 95K bytes of random-access memory.

The price for the Macintosh version, scheduled for December shipment, is $149. Cost for the MS-DOS version is $195.

Warner Software, 666 Fifth Ave., New York, N.Y. 10103.

ADVANCED PRODUCTIVITY SOFTWARE
Executime

Advanced Productivity Software has announced an enhanced version of its Executime time management/scheduler program for the IBM Personal Computer AT, using either IBM's PC Xenix or IBM's PC-DOS 3.0 operating system.

Among enhancements in the new version is a Multiple Schedule File capability, which allows a single user to create many separate schedule files, the vendor said.

A Universal Search option is said to speed the user's access to a list of appointments and reminders that contain any user-defined name, word or symbol.

The Warning Notice feature reportedly alerts the user when a requested appointment time has already been scheduled.

The price for Executime for PC-DOS is $49.95; for Xenix, it is priced at $69.95.

Advanced Productivity, 2565 E. Chapman Ave., Fullerton, Calif. 92631.

See TOOLS page 64

Irma adapted to IBM's AT

NORCROSS, Ga. — Digital Communications Associates, Inc. has announced that its Irma micro-to-mainframe communications board has been adapted to the IBM Personal Computer AT.

Using Irma, the Personal Computer AT can emulate an IBM 3278 or 3279 terminal and transfer data to and from a mainframe while retaining its stand-alone capabilities, Digital Communications said.

The adaptation of Irma to the Personal Computer AT brings to the AT a host of software programs developed with the Irma board in mind, according to the company.

Irma for the IBM Personal Computer AT is priced at $1,195.

Digital Communications Associates is located at 303 Technology Park, Norcross, Ga. 30092.

BEHAVE from page 57

IBM's Virtual Device Interface (VDI), GEM, Microsoft Windows, Microsoft Networks and others — which may conflict with each other.

In the most spectacular example, Topview, the leading contender for widespread adoption, does not seem to be compatible with VDI or IBM's PC Network or much of anything else. Developers want to follow IBM's lead, but many are not quite sure what that means.

Until the dust clears on the requirements for the well-behaved packages of the future, many software developers will avoid committing themselves, and those impressive new environments may not mean much to users.

TANDY from page 57

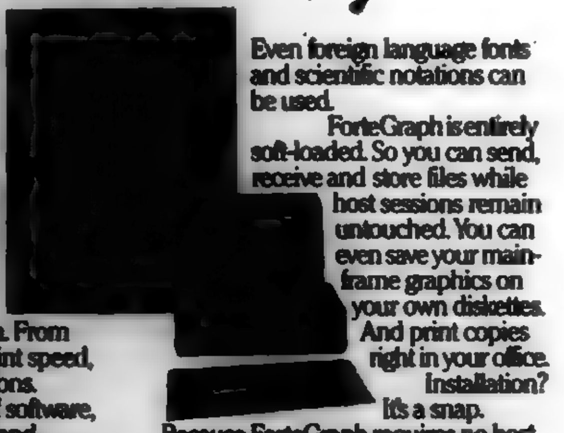
plications as a set of "desk organizer" programs and said the bundled packages are not meant to compete with "full-blown" applications software.

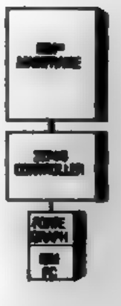
The Tandy 1000, which comes with one floppy disk drive and a detachable keyboard, provides 128K bytes of random-access memory, expandable to 360K bytes, the company said. It is priced at $1,199, exclusive of the monitor.

The model features a three-voice sound generator and several built-in capabilities, including support for color and monochrome monitors, parallel printer port, joystick and light pen ports, according to the company.

Radio Shack is located at 1700 One Tandy Center, Fort Worth, Texas 76102.

Forte puts mainframe graphics on your PC





Get mainframe graphics right at your desk. With the ForteGraph™ Emulator.

Just add it to the Forte PJ™ communications adaptor. Without using an extra slot. You're ready to roll with a single PC keystroke.

With a compatible monitor, you'll get true 3279 model S3G emulation. From color quality and screen print speed, right down to pixel resolutions.

Dip into a palette of software, like GDDM,† SAS/GRAPH® and ISSCO's TELLAGRAF.™ Create pie and bar charts, histograms and conceptual drawings. Or paint up a storm with your own custom-designed characters.

Even foreign language fonts and scientific notations can be used.

ForteGraph is entirely soft-loaded. So you can send, receive and store files while host sessions remain untouched. You can even save your mainframe graphics on your own diskettes. And print copies right in your office.

Installation? It's a snap. Because ForteGraph requires no host hardware or software modifications.

Graphic smarts from Forte. Colorful. Creative. Easy to use. And ready for you now.

DunsPlus: The Micro Solution That Reflects The Way You Do Business

You've heard the buzzwords: user friendly, integrated, smarter, faster, cheaper. But when you push the rhetoric aside you're still asking the same question, "Why can't I get a system that solves more problems than it creates?"

You can. It's called DunsPlus and it's built to respond to your information-related business demands without creating demands of its own.

DunsPlus gives the IBM PC XT a built-in business environment. This lets you mold DunsPlus to fit the way you do business.

Within the DunsPlus environment is a software base of the best. Lotus, MultiMate, Western Union electronic mail (to name but a few), are all ready for immediate use. But additional programs to solve your unique problems can also be added with ease.

Instant, yet controlled, access to your choice of mainframes and subscription databases is also a part of the DunsPlus environment. And transferring data throughout the system is as easy as moving a piece of paper from the In Box to the Out Box.

Immediate end-user productivity is not an issue: DunsPlus is a menu-driven system requiring minimal keystrokes for maximum results.

Installation is not an issue: DunsPlus is installed by IBM.

End-user training is not an issue: Training and support are part and parcel of DunsPlus.

Flexibility is not an issue: Any part of the DunsPlus solution—hardware, software, or service—can be tailored to meet your precise business needs.

In fact, there are no issues. DunsPlus does what you want, the way you want it—now.

Designing systems that reflect the way you do business is business as usual for us. NOMAD2, the premier 4th-Generation-Language/DBMS from D&B Computing Services, has made us a leader in the field of information management services. And as your needs evolve, so do we. DunsPlus is just the latest step in translating technological advances into usable business tools—tools that reflect the way you do business.

DunsPlus: An Innovation In End-User Computing From Dun & Bradstreet

DunsPlus

a company of
The Dun & Bradstreet Corporation

For further information call: 800-DNB-PLUS. Or drop your business card into an envelope and mail it to DunsPlus, 187 Danbury Road, Wilton, CT 06897.

SOFTWARE HOUSE
System 1032

Software House has introduced a version of its System 1032 data base management system for the Digital Equipment Corp. Microvax. System 1032 for the DEC Microvax reportedly is based on the System 1032 for DEC's VAX-11 minicomputers.

System 1032 did not require downscaling to run on the Microvax and contains the same features found in the VAX-11 version, the vendor said. Those features reportedly include user assistance, on-line documentation, full programming capabilities, host language interface, support for DEC's Decnet, data security and compiled procedures.

System 1032 for the Microvax is priced at $3,000 per CPU for those who already own a System 1032. Otherwise, it is priced at $8,000 for the first copy.

Software House, 1105 Massachusetts Ave., Cambridge, Mass. 02138.

COMPUTER SCIENCE INNOVATIONS, INC.
Software Design Language

Computer Science Innovations, Inc. has developed a software design language for use with the IBM Personal Computer and systems compatible with Microsoft Corp.'s MS-DOS operating system.

Software Design Language produces formatted design documents, the vendor said. The program reportedly can be used to design software at the system, process, module and algorithm levels. It is said to allow data items to be named and to support user-defined keywords.

A permanent license for the product costs $400.

Computer Science Innovations, P.O. Box 2628, Satellite Beach, Fla. 32937.

DATABASE DESIGN, INC.
Action Diagrammer

Database Design, Inc. has introduced a software editor that runs on the IBM Personal Computer and compatibles.

Action Diagrammer is said to be based on a structured, graphics representation of the action comprising a software program as a hierarchy of bracketed blocks. Action diagrams reportedly can represent a high-level overview of a system and progressively decompose it to the level of executable code.

At the highest overview level, a program is pictured as single bracket. Fully expanded control flow and processing logic are grouped and bracketed in deeper levels of the hierarchy, the vendor said.

Action Diagrammer is said to supply control structure syntax in English, Cobol, PL/I, Fortran, C, Pascal and fourth-generation languages automatically. It reportedly enables the system designer to integrate modularity, hierarchical organization, control flow and structured logic constructs.

The package is priced at $495.

Database Design, 2020 Hogback Road, Ann Arbor, Mich. 48104.

ZONTEC, INC.
SPC Timesaver

Zontec, Inc. has introduced a color statistical process control (SPC) package that runs on the IBM Personal Computer.

SPC Timesaver is said to be an integrated system for the analysis, storage and display of SPC chart information. These charts reveal variations from norm, percentage, failures, trends, number of samples outside control and whether the process is capable of producing the desired results, the vendor said.

The program reportedly is able to maintain multiple sets of control limits within a single set of samples. Five main analysis functions are included: control charts, descriptive statistics and capability, tool wear and economic impact analysis.

SPC Timesaver will run on any IBM Personal Computer or compatible with 256K bytes of memory. A color graphics board is recommended by the vendor, although the program will reportedly work with a monochrome display. Price is $695.

Zontec, Suite 4135, 1329 E. Kemper Road, Cincinnati, Ohio 45246.

FUJITSU MICROELECTRONICS, INC.
Concurrent CP/M 86 for Micro 16S

Fujitsu Microelectronics, Inc. has announced that Digital Research, Inc.'s Concurrent CP/M 86 operating system is now available for Fujitsu's Micro 16S series of personal business computers.

The multiuser Concurrent CP/M 86 operating system is said to enable Micro 16S and Micro 16SX computers to perform more than one computing task simultaneously and to support up to five external terminals.

As the main console, the Micro 16S can support four virtual consoles that can be accessed by pressing a designated combination of keys. The virtual consoles allow up to four programs to be active on the Micro 16S. While one program is being viewed, other programs can be completing tasks such as financial calculations in the background, the vendor said.

Concurrent CP/M 86 is priced at $200. A five-user configuration of the Micro 16SX system with a 13M-byte hard disk, 896 bytes of user random-access memory, controllers, color monitor and the multiuser operating system, excluding terminals and printer, is priced at $7,100.

Fujitsu Microelectronics, 3320 Scott Blvd., Santa Clara, Calif. 95051.

Q: How Many People Are Afraid Of Your 4-GL/DBMS?
A: None, If You Have EZNOMAD.

That's right. EZNOMAD is a major extension of NOMAD2 that pulls novice and infrequent end-users into the mainstream of mainframe computing. EZNOMAD's screen-driven environment requires no key words, system commands, or knowledge of syntax for operation.

With EZNOMAD, your end-users can sit back and follow a series of English-language instructions, menus, and pick-and-point screens. Now, those busy "management types" who "never have the time" to learn mainframe computing don't need to take the time. Infrequent users no longer need to "relearn" the system every couple of months.

EZNOMAD's micro-like capabilities access essentially all of the functions and power of NOMAD2. Imagine a senior manager in your company developing databases, creating applications, maintaining databases, and writing ad hoc reports — without your help.

Your senior management will not only be pleased with the capabilities of EZNOMAD, they will also be delighted with the cost of EZNOMAD—its's free to all NOMAD2 licensees.

In other words, you get the ease-of-use of a micro and the tremendous power and flexibility only a mainframe can deliver. And the price is right.

It's nice to know that when you pick NOMAD2 as the 4-GL/DBMS for your company, EVERYBODY will know first-hand that you've made the right choice.

EZNOMAD is the latest innovation in end-user computing from Dun & Bradstreet. NOMAD, now NOMAD2, has evolved over the years to keep pace with the demands for providing business professionals with maximum computing power. EZNOMAD is a major stride in that direction.

DATAGRAPHIC SYSTEMS, INC.
CAD Master Version 2.0

Datagraphic Systems, Inc. has announced enhancements to its CAD Master, a computer-aided design (CAD) software package for the IBM Personal Computer line.

Among CAD Master's features reportedly are autodimensioning, autotolerancing, architectural dimensioning, curve fitting, filleting, mirror imaging and computation of volume and perimeter. Also included are a line and arc editor, a bill-of-materials function, data base extraction and a finite element preprocessor. Other features include "rubberbanding" of lines, arcs, circles and arrows.

CAD Master Version 2.0 is $1,795.

Datagraphic Systems, 9101 General Drive, Plymouth, Mich. 48170.

MICRO-SYSTEMS SOFTWARE, INC.
M-Edit

Micro-Systems Software, Inc. has introduced M-Edit, a tool for full screen editing on the IBM Personal Computer.

M-Edit reportedly offers word-processor-like functionality in as many as eight windows at once and also supports data transfer between windows. M-Edit includes block copy/block move functions. Each of the package's windows reportedly has a 64K-byte buffer and allows text lines of up to 240 char. to be created.

M-Edit is priced at $199.

Micro-Systems Software, 4301-18 Oak Circle, Boca Raton, Fla. 33431.

MITCHELL MANAGEMENT SYSTEMS, INC.
Quick-Plan

Mitchell Management Systems, Inc. has introduced its Quick-Plan project planning software for personal computers running under Microsoft Corp.'s MS-DOS operating system.

Quick-Plan reportedly builds project plans based on time, costs and resources using a series of menus written in English. It is said to offer editing and modeling capabilities and 13 different report formats.

Quick-Plan's four types of connectors and use of precedence diagramming reportedly allow it to handle 250 activities, 99 resources and 500 connectors for each project.

Quick-Plan is priced at $995.

Mitchell Management Systems, Westboro Office Park, 2000 W. Park Drive, Westboro, Mass. 01581.

PRIORITY SOFTWARE PACKAGING, INC.
Softcop

Priority Software Packaging, Inc. introduced a series of software protection programs said to guard against software piracy on micros utilizing IBM's PC-DOS, Digital Research, Inc.'s CP/M 86, Softech Microsystems, Inc.'s P-System and Apple Computer, Inc.'s Apple DOS.

Software Controlled Operating Protection (Softcop) is said to use a combination of validation and defense systems to provide security of protected software.

In a related announcement, Priority Software said it is now offering Softguard System's Superlok software protection program for IBM's PC-DOS applications through a licensing agreement with Softguard.

Softcop and Superlok are said to feature hard-disk support and authorized backup. According to the vendor, all forms of software can be protected with Superlok and Softcop, including templates and interpretive Basic programs. The protection programs are said to be self-executing and invisible to legitimate users of the protected software.

Software protection ranges in price from 10 cents to $1.50 per diskette. The actual cost depends on duplication quantities and the protection features required.

Priority Software Packaging, Unit A, 2730 S. Harbor Blvd., Santa Ana, Calif. 92704.

TEXAS INSTRUMENTS, INC.
Framework, Dbase III for TI Professional

Texas Instruments, Inc. has announced that Ashton-Tate's Framework and Dbase III packages will be available on the TI Professional in the first quarter of 1985.

Framework, an integrated software package, combines outlining, business graphics, data management, word processing, telecommunications, Microsoft Corp. MS-DOS access, spreadsheet capabilities and a programming language, TI said. The recommended configuration for a TI Professional includes 512K bytes of random-access memory and either two floppy disk drives or a Winchester disk drive.

Dbase III is a data base management system that features storage capacity of over 2G records per file (contingent on system hardware), 128 fields per data base and the ability to use 10 files simultaneously.

Each product will cost $695.

Texas Instruments, Data Systems Group, P.O. Box 809063, Dallas, Texas 75380.

ENERTRONICS RESEARCH, INC.
Energraphics

Enertronics Research, Inc. has introduced Energraphics graphics software for the IBM Personal Computer.

Energraphics reportedly provides users with the ability to create and display or print line charts, pie charts and two- and three-dimensional bar charts. Also provided is the ability to produce maps, electronic circuit diagrams, mechanical and architectural drawings and surface diagrams, among other forms, Enertron-

Get better decision-making, more [illegible] and a very profitable competitive edge. Instantly.

What if everyone in your office were suddenly able to design their own applications, whether they knew anything about programming or not? What if this left you and your computer professionals free to concentrate on really important jobs?

Well, this is exactly what SMARTSTAR does. It puts the power of the VAX at the fingertips of those who need it, no matter how much or how little they know about programming. They get information fast. So they can make decisions fast. Productivity skyrockets. And so does profitability.

Programmers are relieved of the tedious jobs, the busywork — and most important, the backlog of programming jobs that will now be handled by end-users.

For complex applications, SMARTSTAR's structured interface and built-in callable routines reduce development time by a 10 to 1 ratio. Features like scrolling format, multiple overlapping windows and simple keypad commands simplify the whole decision support process for everyone. SMARTSTAR even works with DEC's new VAX/Rdb to make accessing the database a snap.

Call Signal Technology, the leading independent developer of VAX software, for a 30-day trial or on-line demo. See how SMARTSTAR can make your whole office shine.

CONDUCTOR: The MIS Approach to End-User Access

Today—end-users need greater access to data. And MIS needs better control. To solve both problems, TSI introduced CONDUCTOR.

CONDUCTOR lets end-users get the data they need. CONDUCTOR selects, manipulates and delivers data to any end-user environment. Without programming. And CONDUCTOR gives MIS more control than ever over quality and integrity, with a new degree of security.

While others have tried to solve the end-user problem, they've only addressed a small part. CONDUCTOR goes for the big picture. So remarkably different, there's virtually nothing else like it.

CONDUCTOR is the latest innovation in software from Dun & Bradstreet. As such, it joins NOMAD, now NOMAD2, the premier 4-GL/DBMS from D&B Computing Services, and DunsPlus, the "people literate" microcomputer that reflects the way you do business.

Find out about TSI's CONDUCTOR today. We're sure you'll like the way it helps you CONDUCT business.

TEXAS INSTRUMENTS, INC.
Natural Link

Texas Instruments, Inc. has announced Natural Link software packages, which permit TI Professional Computer users to interact with popular software programs using simple English commands.

The 10 packages reportedly translate user-constructed English sentences into commands that the underlying software package will recognize. The same Natural Link format is followed in each application package, giving users a familiar interface for all Natural Link programs, TI said.

The Natural Link programs are configured for Microsoft Corp.'s MS-DOS 2.1 operating system and nine application programs: Multimate, from Multimate International Corp.; Wordstar, from Micropro International Corp.; BPS Business Graphics, from Business Professional Software, Inc.; Supercalc 3 and Easywriter II, from Sorcim/Information Unlimited Software; Dbase III, from Ashton-Tate; Peachtext 5000, from Peachtree Software, Inc.; Microsoft's Multiplan; and Microrim, Inc.'s R:Base 4000 series.

Natural Link Access to MS-DOS requires a TI Professional or Portable Professional with MS-DOS 2.1 and at least 256K bytes of random-access memory (RAM). Natural Link Commands products require MS-DOS 2.1, 512K bytes of RAM and a Winchester disk drive.

Natural Link Access to MS-DOS costs $75. Natural Link Command programs for the above applications are priced at $125 each, the vendor said.

Texas Instruments, Data Systems Group, P.O. Box 809063, Dallas, Texas 75380.

SYSTEMS

MOLECULAR COMPUTER, INC.
Molecular Series 36

Molecular Computer, Inc. has introduced the Series 36, a multiprocessor system said to provide each user with one or more dedicated personal computers through individual application processors.

All processors and peripherals for all users are contained within the Series 36's systems cabinet. The cabinet reportedly contains slots for up to 36 application processors, both 5¼-in. and 8-in. floppy disk drives, a Winchester disk drive and an optional cartridge tape drive.

Each user's application processor is interconnected to all others by the vendor's M/Bus interprocessors link, which also provides high-speed access to shared disks, printers and other peripherals, the vendor said.

"I RELY ON AST FOR

MICROCOMPUTERS

Molecular's N/Star network operating system software is said to provide the ability to share data files and is compatible with Digital Research, Inc.'s CP/M 80 and CP/M 86.

The combination of the M/Bus and N/Star is said to provide the equivalent of a local-area network within the systems cabinet.

Price is $21,995 without tape backup and $23,995 with disk drive.

Molecular Computer, 251 River Oaks Pkwy., San Jose, Calif. 95134.

WICAT SYSTEMS, INC.
System 2220; Wicat Interactive Terminal

Wicat Systems, Inc. has introduced its System 2220 and its Wicat Interactive Terminals (WIT).

A rack-mounted unit said to offer 1M byte to 12M bytes of random-access memory (RAM), the System 2220 reportedly supports from one to 64 users and features a 12.5-MHz Motorola, Inc. 68000 central processing unit, a 4K-byte cache memory system and zero wait states.

The WIT is said to be an intelligent color graphics terminal offering a video interface option.

The WIT also includes a 12.5-MHz Motorola 68000 microprocessor with zero wait states and 256K bytes of downloadable RAM, according to the vendor.

It also includes commands for high-speed graphics operation and audio capabilities, Wicat Systems said.

The System 2220 is priced starting at $40,720, including the central processing unit, an 80M-byte disk and a 17M-byte, ¼-in. tape cartridge storage unit.

The WIT is priced starting at $7,275, including the video option.

Wicat Systems, P.O. Box 539, 1875 S. State, Orem, Utah 84057.

COMMUNICATIONS

SOPHIA COMPUTER SYSTEMS, INC.
Link for IBM Personal Computer and SA700 emulators

Sophia Computers Systems, Inc. has announced a serial communication link for the IBM Personal Computer said to allow users to download microprocessor software developed on the Personal Computer XT to Sophia's in-circuit emulators.

The link supports file transfer from the Personal Computer XT to Sophia's SA700 in-circuit emulators, used for troubleshooting. Any Microsoft Corp. MS-DOS or IBM PC-DOS system can function as a development host, the company said.

The price for the Personal Computer link is $495.

Sophia Computer Systems, 3337 Kifer Road, Santa Clara, Calif. 95051.

CXI, INC.
3270 and 3278/79 IBM Personal Computer connections

CXI, Inc. has announced that its 3270 IBM Personal Computer connections and 3278/79 IBM Personal Computer connections are compatible with the Personal Computer AT under IBM's PC-DOS 2.0 and 2.1.

The connection products reportedly allow users to have from one to five host sessions, a PC-DOS session and two notepads displayed on screen simultaneously.

The CXI 3270 Personal Computer connections reportedly are available either as coaxial or modem connections and provide IBM 3270 emulation.

The 3270 Personal Computer coaxial and modem connections are $1,595 each. The 3278/79 Personal Computer coaxial and modem connections are $1,145 each.

CXI, 3606 W. Bayshore Road, Palo Alto, Calif. 94303.

MICRO-TO-MAINFRAME COMMUNICATIONS SOLUTIONS."

Working IBM® PCs into the world of large computers used to be quite a headache. But now that I've discovered AST and their full line of proven communication products, things are much easier.

Last week, for instance, the VP of Finance said he wanted to tie into the mainframe down the hall from his office. AST-PCOX™ was my instant answer. We just plugged the card into his PC, then ran a coax cable to the IBM controller. No need to double up on hardware or clutter up his desk with a dumb terminal.

Today, I'm solving a complex problem for our Director of Marketing. He's opening up seventeen new field sales offices and wants to link them to our host at headquarters. Now, at the same time, we're looking to convert our communication network from BSC to SNA. Here AST really protects my hardware investment.

You see, they have SNA and BSC products with the same hardware. I can go with AST-BSC™ today, then just load another disk to upgrade to AST-SNA.™ And with AST's plug-in cards, PCs can emulate 3274/6 controllers, 3278-2 or 3279-2A terminals, even 3287 printers.

Using PCs in the field sales offices gives us the flexibility of local PC processing power, and the benefit of concurrent processing, since we can use DOS functions while continuing to maintain the mainframe link. It's certainly a major money-saver—a really smart alternative to dumb terminals.

We expect those new sales offices to grow rapidly. When they do, I'll be adding AST cluster functions so we can use PCs and VT-100™ or compatible terminals in our configuration. All of them can communicate to headquarters over a shared phone line to reduce our telecommunications costs.

Meeting the challenge of change is a key part of my job. AST always has the products to help me. Like LANs to tie all PCs—including ATs and PCjrs together. There's also an AST-5251™ to connect PCs to System/34, System/36 and System/38 for powerful interactive communications from remote sites.

AST was the first company to offer micro-to-mainframe products for the PC, and they continue to lead the pack with a full spectrum of communications products, including AST-3780™ RJE support. Customer support and product reliability. That's why AST is my single source.

Frankly, you should find out more about them. Give their Customer Information Center a call at (714) 863-1333 Ext. 5249 and get acquainted. Just tell them you were referred by another satisfied MIS director.

IBM PC trademark of International Business Machines Corporation. DEC and VT-100 trademarks of Digital Equipment Corporation. AST-PCOX, AST-SNA, AST-BSC, AST-3780 and AST-5251 trademarks of AST Research, Inc. AST-5251 is a product developed by AST Research, Inc. and Software Systems, Inc. of Jefferson City, MO.

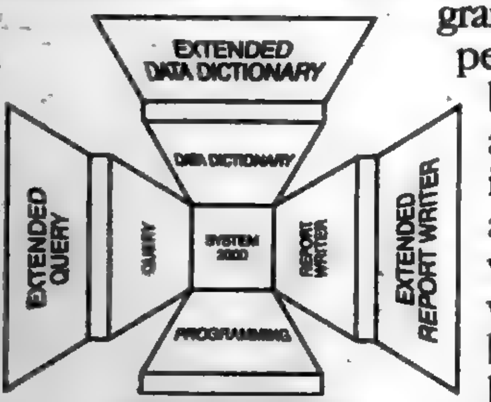
SYSTEM 2000® DBMS. WHEN YOU BOUGHT IT FIVE YEARS AGO, THEY THOUGHT YOU WERE SMART. TURNS OUT YOU WERE A GENIUS.

In the beginning, you bought your SYSTEM 2000 DBMS because it was the best anywhere.

You also figured Intel simply wouldn't be able to leave well enough alone.



The SYSTEM 2000 DBMS offers a powerful set of integrated functions. The result is the broadest and deepest functionality of any DBMS.

You were right.

And, thanks to a continuing program of product enhancements, our DBMS keeps getting better and better.

While you keep looking smarter and smarter.

Now, in addition to all of our previous improvements, the SYSTEM 2000 DBMS also offers Relational Database Access (RDBA).

RDBA is an enhancement of our system's query and report languages which gives relational access to multiple databases. Which, in turn, enables users to greatly reduce programming time, perform database modeling and engage in "what if" analyses. Some very noteworthy user benefits in anybody's book.

It all adds up to the broadest, deepest functionality of any DBMS anywhere.

The kind of functionality that allows virtually any pc to share data with virtually any mainframe. We call it the Data Pipeline™ system.

The ingenious SYSTEM 2000 DBMS.

Backed by a billion-dollar-plus, technologically-renowned company which continues to support each and every SYSTEM 2000 DBMS with complete training, documentation and hotline services.

If you don't already have our SYSTEM 2000 DBMS working to keep you looking smarter, call us today at (800) 538-1876. In California, call (800) 672-1833.

Or write: Intel, Lit. Dept. H21, 3065 Bowers Ave., Santa Clara, CA 95051.

There's still time to go to the head of the class.

FORTE DATA SYSTEMS
Fortegraph and Forte 3270 PC

Forte Data Systems has announced that its Fortegraph software and board package is compatible with the Irma communications board from Digital Communications Associates, Inc. It also introduced its Forte 3270 PC for the IBM Personal Computer.

Fortegraph, running in conjunction with the Irma emulator for the IBM 3278/79 terminal, reportedly provides mainframe graphics capabilities to the Personal Computer. It also allows the Personal Computer to function as an IBM color graphics terminal and offers emulation of the IBM 3279 Model S3G color graphics terminal with programmed symbols, according to the vendor.

Forte 3270 PC reportedly allows the Personal Computer to gain the functions of an IBM 3270 workstation.

Forte 3270 PC is priced at $1,495. Fortegraph with Irma compatibility is priced at $1,595.

Forte Data Systems, 2205 Fortune Drive, San Jose, Calif. 95131.

STORAGE

PERCOM DATA CORP.
Superior Interior

Percom Data Corp. has introduced its Superior Interior 22M-byte, half-height disk storage system for the IBM Personal Computer.

The Superior Interior reportedly mounts in the second drive position of a Personal Computer, giving users internal floppy and hard-disk capability.

The disk storage system reportedly has a height of 5¼-in., a step time of 3 msec and a data transfer rate of 5M bit/sec.

It includes a soft-start motor and filtering system to reduce electronic noise, Percom said.

The Superior Interior is priced at $2,195.

Percom Data, 11220 Pagemill Road, Dallas, Texas 75243.

COGITO SYSTEMS CORP.
PT925 enhancement

Cogito Systems Corp. has enhanced its 25M-byte, half-height Winchester disk drive to provide a reported 37% increase in speed.

The enhanced PT925 features 25M bytes on two platters, using all four surfaces for storing data, according to Cogito Systems.

It also offers a dedicated head landing zone and three-axis shock mounts, said to be effective up to 40 g forces.

It also is said to include a band-driven stepper motor actuator operating in an open loop linear mode to achieve access time of less than 85 msec.

The drive is priced at $795, the vendor said.

Cogito Systems, 235 Zanker Road, San Jose, Calif. 95131.

PRINTERS/PLOTTERS/ PERIPHERALS

EXXON OFFICE SYSTEMS CO.
Exxon Ink Jet Printer

Exxon Office Systems Co. announced that its ink jet printer can now be used with the IBM Personal Computer and Personal Computer XT for high-resolution printing of graphics and text.

The Exxon Ink Jet Printer uses device driver software that is inserted into the operating system of the Personal Computer or Personal Computer XT. The printer is said to produce correspondence-quality print in a variety of type styles.

Users can choose to install up to eight resident fonts from a selection of more than 20 type styles, the vendor said. The device driver is said to permit the unit to print output from personal computer applications at speeds up to 90 char./sec.

Prices for the printer begin at $2,995. The device driver software costs an additional $95.

Exxon Office Systems, 777 Long Ridge Road, Stamford, Conn. 06902.

BOARD-LEVEL DEVICES

THEYS MEMORY PRODUCTS CORP.
Fastfile

Theys Memory Products Corp. has announced the Fastfile semiconductor memory system, featuring an access time of less than 0.25 msec and a data transfer rate of up to 1M byte/sec.

Fastfile has a built-in uninterruptible power supply and uses 256K-byte semiconductor memory chips. The chips feature single-bit error correction and double-bit error correction with parity checking on internal data transfers.

The product is intended to work in local-area networks and multiuser applications where it can reduce disk access time and the frequency of disk access, the company said.

The price for the 1.5M-byte storage capacity version of Fastfile is $1,795, and the price for the 5M-byte version is $3,495, according to the company.

Theys Memory Products, 7345 E. Acoma Drive, Scottsdale, Ariz. 85260.

AST RESEARCH, INC.
Preview!

AST Research, Inc. has introduced Preview!, a monochrome display adapter board for the IBM Personal Computer, Personal Computer AT and Personal Computer XT.

Preview! reportedly offers bit-mapped graphics compatible with several business software packages, including Ashton-Tate's Framework and Lotus Development Corp.'s Symphony and 1-2-3.

Preview! is priced at $399, the vendor said.

AST Research, 2121 Alton Ave., Irvine, Calif. 92714.

MAKE YOUR 3705'S PRICE/PERFORMANCE AN ENCORE.

Before you applaud IBM's song and dance for the 3725 Communications Controller, talk with Centron DPL about your 3705.

Your 3705 is a tough act to follow.

Chances are good that your 3705 will fill your needs at considerable savings for some time to come. Centron DPL has the hardware, technical services, and financial expertise to coax an encore from your 3705.

Add memory up to a megabyte.

You still have the option to upgrade to 512K using IBM memory, but the 3705 was built with the potential for even more. Centron DPL will build your 3705 memory up to a *full* megabyte.

Add an expansion frame to increase the number of available lines.

In many ways, your 3705 is more flexible than a 3725. It allows you to add lines as you need them, and you can continue to run asynchronous lines.

Centron DPL has model upgrades and expansion units in stock for immediate delivery at significant savings.

Lease a communications controller from the company that understands your need for flexibility.

Centron DPL will write a lease that fits your requirements; whether it's a purchase/leaseback, a lease for additional features or upgrades; or a short-term 3705 lease interim to your 3725 acquisition.

Since we maintain control of the lease, you can upgrade or add features of any size at any time. The rates for upgrades can be set in advance to offer you price protection.

We support our leases with an extensive inventory of features and upgrades, our *own* technical services division, and a complete refurb center.

Discuss your 3705 with one of our representatives today. We'll show you that it may be too early to let the curtain fall.

How to get caught in the middle of today's biggest controversy.

FOCUS

on UNIX.

Love it or hate it, UNIX™ is one of the most controversial topics of the day. And that's just the way we'll be presenting it in January's premier issue of Computerworld Focus.

Everyone with any interest in UNIX will be sure to read the January 16th issue of Computerworld Focus, where we'll really dig deep into today's issues and answer some of the toughest questions. Which version is best for what operations? How do you implement applications software? Is UNIX truly portable? How to make UNIX user friendly. With pages chock full of user opinions. Expert views. Tutorials. Investigative reports and other information.

Whether you have a UNIX compatible service or product, or a UNIX alternative, there will never be a better place to make your case. You'll get over 126,000 Computerworld paid subscribers for starters. Plus our high pass-along readership. Plus bonus circulation at the UniForum show on January 21-25 in Dallas, Texas.

But hurry, January's Computerworld Focus closes December 7. So act now. To reserve your space or for more information, call Ed Marecki, National Sales Director, at (617) 879-0700. Or call your nearest sales office listed below.

UNIX is a trademark of AT&T Laboratories.

COMPUTER INDUSTRY

STC third-quarter report details losses

LOUISVILLE, Colo. — Storage Technology Corp. (STC) posted a third-quarter loss of $64.7 million, according to its recently released financial report. The company's anticipation of that loss had earlier led it to file for protection under Chapter 11 of the Federal Bankruptcy Act.

The loss for the quarter, equal to $1.87 per fully diluted share, compared to a year-earlier loss of $6.9 million, or 20 cents per fully diluted share. For the first nine months of the current fiscal year, STC posted a loss of $86.2 million, or $2.49 per share; that figure included a tax benefit of $24.3 million. The company had reported a quarterly loss of $5.4 million, or 5 cents per share, in the comparable period in 1983.

STC actually posted a revenue gain for the third quarter, $282.2 million, compared to year-earlier revenues of $201.4 million; however, costs and expenses soared to $282.2 million, compared to $212.5 million in the third quarter last year. For the first nine months, revenues declined to $656.6 million, compared to $659.6 million last year, and expenses increased to $767.2 million from $664.6 million the previous year.

The third-quarter loss was compounded by federal tax adjustments for the years 1977 and 1978, the company said. Despite a pretax loss of $52.5 million, the company paid income taxes of $12.4 million.

Lower than expected shipments

STC attributed the financial problems to lower than anticipated shipments, higher costs for new products, lower margins due to price cutting and increased depreciation expenses on rental equipment.

Additionally, the company said that it had placed its Dublin subsidiary, Storage Technology Products B.V., into receivership. That subsidiary, employing 363 people and engaged in manufacturing products for the European market, was acquired in 1980 as part of the acquisition of Documation, Inc. STC said its facilities in the U.S. and Puerto Rico would supply the market formerly served by the Irish subsidiary.

Prior to the release of the financial report, STC Chairman Jesse I. Aweida met with company creditors and U.S. trustee Dolores Kopel. Aweida pledged the company's full cooperation and desire "to emerge from Chapter 11 as rapidly as possible with a reorganization plan acceptable to

Trade secret suits devastate firms

While not all trade secret lawsuits make splashy headlines like last year's IBM-Hitachi Ltd. case, such legal battles are being waged throughout the computer industry at terrific cost to the combatants. In some instances, the very survival of a company may be at stake.

Eagle Computer, Inc. and Franklin Computer Corp. are two recent cases in point. Eagle, a maker of IBM-compatible microcomputers, has been struggling to stay afloat ever since IBM slapped it with a patent infringement suit early this year. And Franklin, burdened by a $2.5 million settlement of a copyright infringement suit brought by Apple Computer, Inc., was forced into a Chapter 11 bankruptcy reor-

Xerox computer chief targets top of factory automation heap

By Kathleen Burton
CW West Coast Bureau

LOS ANGELES — Xerox Computer Services (XCS) President William Fello believes his profitable $100-million division of the Xerox Corp. will garner the lion's share of the lucrative factory automation software market by 1987.

Fello, who took over as XCS' president in April after serving as marketing vice-president, plans rapid growth for the division. Over the next two years, he will integrate Xerox office products with Xerox business systems products and increasingly target vertical markets. "By 1987, vertical software will be more profitable than our services, accounting for half our sales," he said.

XCS' first commercial product, a turnkey manufacturing system called the Xerox Business Management System (XBMS), was introduced last March. It is available on the IBM 4331, the IBM 308 mainframe and the IBM Personal Computer XT. The system's 23 business and manufacturing programs include decision support, computer-aided design/computer-aided manufacturing, engineering, manufacturing control, factory automation tools and a microcomputer-to-mainframe link.

The potential customer base for computer-based manufacturing tools is enormous, according to Fello. Only 5% of the nation's 45,000 small factories producing less than $10 million worth of goods annually have automated their businesses so far. "Most manufacturing plants in the U.S. are still untouched by computers, so computer-based manufacturing is still wide-open territory," he said.

Fello predicted that IBM would not challenge XCS' two-year lead in factory automation software. "IBM's a tough competitor," he said, "but both companies can coexist in this niche." According to Fello,

In face of redoubled market competition, Cray boss optimistic

By Charles Babcock
CW New York Bureau

NEW YORK — Cray Research, Inc. Chairman John A. Rollwagen recently declared that his company will maintain its lead in supercomputers despite competition from the Japanese or possibly even IBM.

Two Japanese companies, Fujitsu Ltd. and Hitachi Ltd., have introduced their own supercomputers, but "there's nothing happening there that's going to knock us off the track," Rollwagen told the New York Society of Security Analysts recently.

"Cray has the lead at the moment, but it's a thin one. It can't afford to fail on one of its next-generation machines," said James C. Browne, professor of computer science at the University of Texas at Austin and chairman of a panel advising the U.S. Office of Science and Technology Policy on supercomputers.

Cray has the lead in producing multiprocessor supercomputers; the Japanese models are still single processor units, said Jack Worlton, a fellow at the Los Alamos National Laboratory, Los Alamos, N.M., who has evaluated tests of the Cray and the Japanese computers. He said the contest is a three-way race between competing technologies — emitter-coupled logic (ECL), gallium arsenide and Cmos semiconductor chips — and which one will win is not clear.

While IBM has not indicated that it will enter the race, Rollwagen's comments reflected concern that it will. About half of Cray's units go into IBM sites, and users transfer some of their engineering and research applications to the Cray machine. This delays the customer's need to upgrade his IBM mainframe, Rollwagen noted.

To stop this "leakage" of mainframe sales, IBM might be tempted to enhance its still-unannounced Sierra line or even offer its own supercomputer, Rollwagen said. "Cray is a tiny company, and I'd never say we can handle IBM. But if they come over to our turf, we'd give them a hell of a fight," he said.

Browne said the Hitachi and Fujitsu supercomputers are IBM-compatible, which puts pressure on IBM to enter the field. IBM cannot wait five or six years to develop its own entry if it finds Japanese units going into its customer sites, he added.

When the Cray-2 becomes available, the Minneapolis manufacturer will have the Japanese bracketed with high-performance, low-cost machines, Rollwagen added.

Half of Cray's components are supplied by Fujitsu; Rollwagen said his company assumes that any information they provide to Fujitsu's semiconductor division ends up in the hands of Fujitsu's computer division.

"Fujitsu tells us no, that is not so, that we are a valued customer," he told the security analysts. He said Cray officials have seen components in the Fujitsu VP 200 that they cannot buy from Fujitsu.

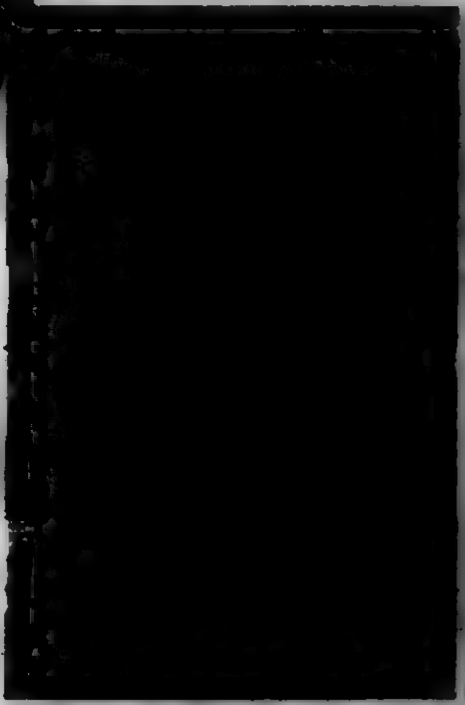
One of the smartest reasons to buy Digital.

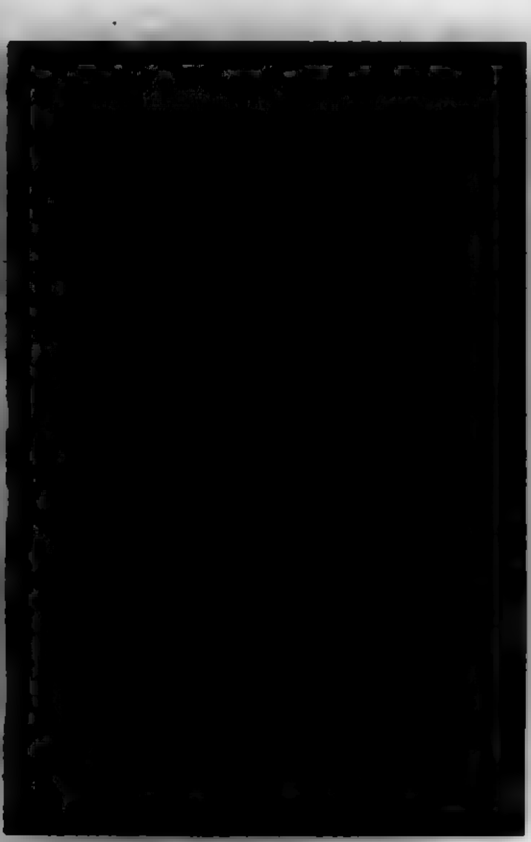
Digital Service.

From the moment you choose Digital, our service organization goes to work to protect your investment. We'll develop your software applications. Train your employees. Keep your system up and running. We're ready to provide the support you need, whether you are running a single system or a large network of systems. Our engineers have even worked alongside customers to build new computer sites with the proper power, air conditioning, and fire protection. From start to finish, Digital Service is a smart decision.

Our people help your people develop the skills they need to get the most out of your Digital computer. We offer more than 500 courses on hardware, software, and office automation. At Digital's worldwide Training Centers. Or at your location. And, at your request, we will even customize training to meet your special needs.



Because no other business is like yours, Digital's software experts help you select the right applications for your business. Or they tailor programs to fit the way you work. And whenever you need the answer to a question or problem, specialists trained in your software applications are only a phone call away.



You select the level of service you need: whether you need on-site hardware support 24 hours a day, seven days a week, with our unique commitment to when service will begin, or the economy of carry-in or mail-in services. Digital gives you a choice.

Digital has over 20,000 service professionals worldwide to give you peace of mind with fast, personalized service. And we deliver that service when and where you need it. That's why Digital Service is the smart choice.

Digital Service is everywhere, because Digital's customers are everywhere. Our specialists regularly service Digital's systems on remote islands. On board ships. Even at the South Pole.

For more reasons to buy Digital Service, call 1-800-DIGITAL.

High-tech industry needs to address Tax Reform Act;

OUTSIDE LINES
A.D. Saunders

Congress' approach to the Tax Reform Act of 1984 reveals major problems that must be addressed by the high-technology community.

First, on the issue of compensation and benefits, the act says a lot about too little and thereby makes compliance difficult because of the paperwork involved. Second, what the act does say often conflicts with other government policies designed to strengthen the ability of U.S. companies to compete on a global scale; and third, the act says nothing about software development accounting when something should have been said.

So many changes have been made that many high-technology companies will find it necessary to go back to the beginning and review all of their benefits via an audit. The crux of compensation and benefits tax policy is whether a benefit will be included as income to the employee or whether it will be deductible by the company as a business expense. Only an audit can pin down what is taxable or deductible and what is not: store discounts, tax preparation services for employees, dining and exercise facilities, parking, tuition reimbursement and the so-called cafeteria plans (which are not related to eating).

Another consideration in evaluating the impact of tax changes in compensation and benefits is whether the benefit is available to all employees or whether it is limited to key employees. The Tax Reform Act tends to favor democracy, so generally speaking, benefits available to all result in no tax to the employee. Certain perks which are usually restricted to senior personnel, such as interest-free loans and stock options, took a beating.

For example, under the old law, a portion of income from the exercise of incentive stock options is ordinary income, and a portion is capital gain. The new law increases the ordinary income amount for these stock options because, as Julia Bell, a tax lawyer with Gaston Snow & Eli Bartlett in Boston pointed out, although the long-term capital gain holding period was decreased in the Tax Reform Act generally, it was not decreased in the area of incentive stock options.

We hear so much adverse commentary about management compensation that we often overlook its real purpose: to attract top-flight people and reward their performance over time. In the high-technology world, being able to compete is as much a function of people as it is finances. Bill Bowman, chairman of Spinnaker Software of Cambridge, Mass., pointed out that a major obstacle has been that Congress "has no idea that stock options are as important and as widely used by small new companies" as they are by large companies like IBM.

Bowman testified at Congress' Joint Economic Committee's hearings and confirmed the fact that some members of Congress were thoroughly ignorant of the industry's views. Hopefully, Bowman said, the hearings will help revamp Congress' piecemeal approach and let them know that "stock options are an important way of life to smaller companies."

A golden parachute is a contract "to provide payments, contingent on a corporate takeover, often equal to several years compensation . . . [which are] deducted by the company as ordinary and necessary business expenses," according to an Ernst & Whinney (E&W) analysis of the Tax Reform Act of 1984.

Saunders is a Boston-based attorney with a practice which includes international marketing, antitrust issues and corporate finance.

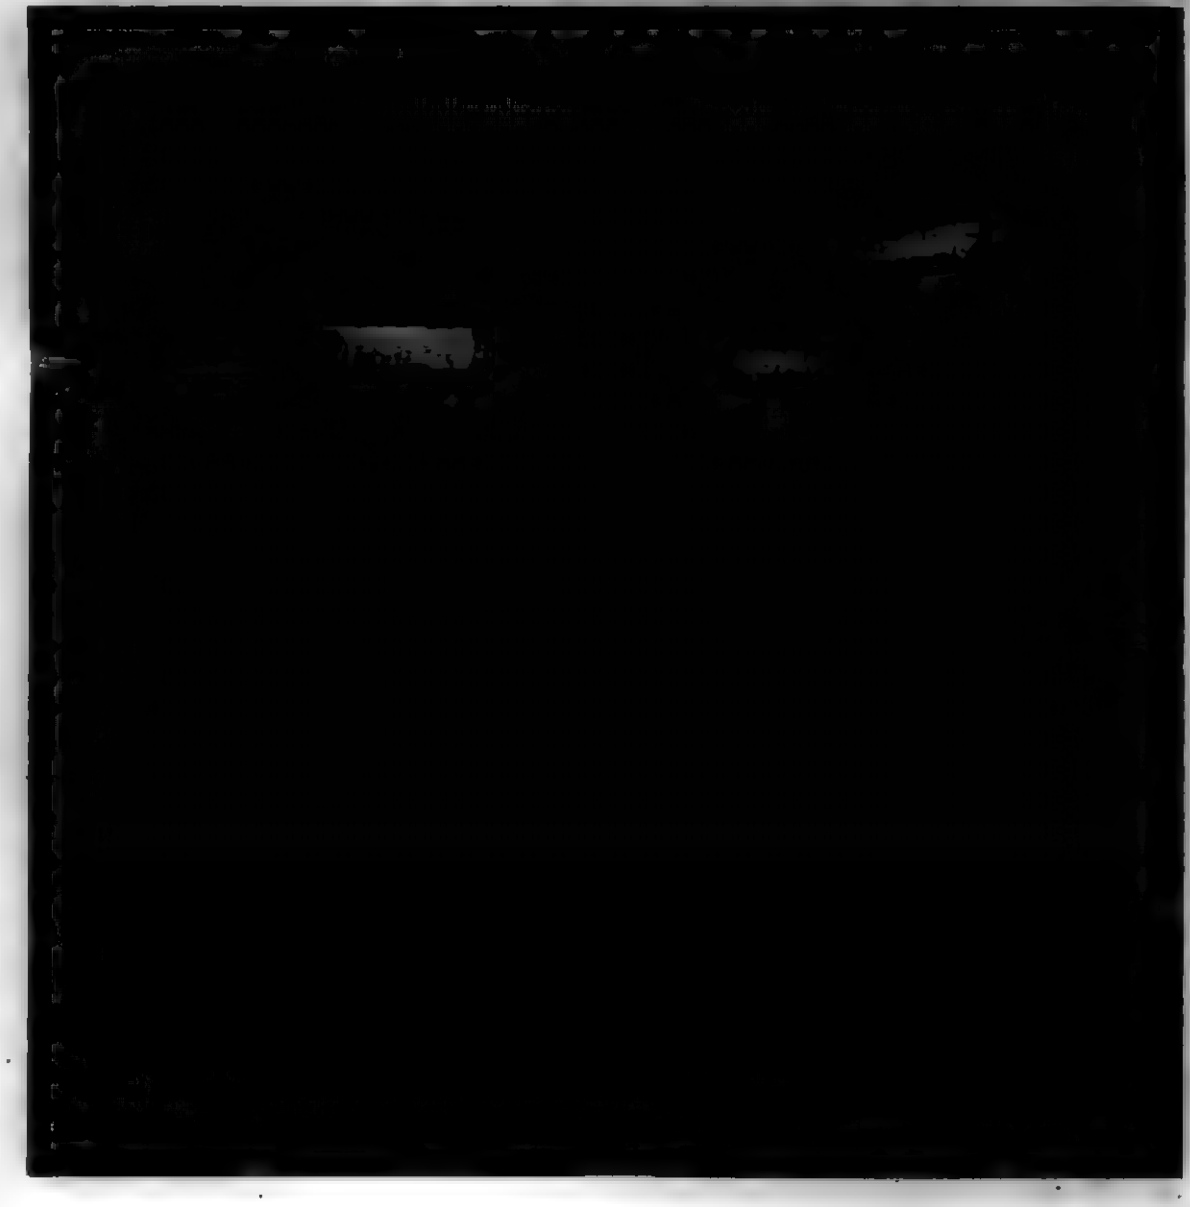
Toward Clearer Communications: InteCom discus



benefits, foreign tax, accounting issues raise concerns

According to E&W, excessive payments are now "presumed to constitute unreasonable compensation and are not deductible by the company. In addition, such payments are subject to [Federal Insurance Contributions Act] taxes, and a 20% nondeductible excise tax is imposed on the recipient."

There has been some talk of restructuring the golden parachute as a covenant not to compete. The payment would be for not doing something contrary to the competitive interests of the company as opposed to actually doing something for the company. The language of the Tax Reform Act makes the present value of the payment the test and not how that payment is otherwise characterized. So it is back to the drawing board for golden parachutes.

The Domestic International Sales Corp. (Disc) has new clothes. It is now called the Foreign Sales Corp. (FSC). The previously deferred Disc income, which would have been taxable under the old law at some unspecified time in the future, has been forgiven and becomes a permanent benefit to the tune of between $8 billion and $13 billion, according to George Yost of Coopers & Lybrand, Inc. The problem of the FSC is whether software will qualify as an export property for FSC purposes.

The new rules on withholding should help U.S. companies (and the U.S. Department of the Treasury) raise capital overseas. They obviate the need for international finance subsidiaries which were often incorporated in the Netherlands Antilles by U.S. companies as a way around the withholding problem. The withholding provision, however, has not come without its own baggage. Securities, bonds and other financial obligations purchased by foreigners are to be in "bearer" rather than "registered" form. The difference is important because of the anonomity they provide. The U.S. Senate feared losses to the public purse, believing only registered obligations, such as ones with the owner's names on them, could prevent tax evasion. The Treasury was in a quandary about what to do, but decided in late August to require money managers to certify that no purchaser is a U.S. citizen or resident. Bearer obligations stand, at least for now.

One of the very complex issues which international tax lawyers face is to determine whether the source of income is U.S. or foreign. If the income is U.S., then U.S. rates apply, but if the source is foreign, the company gets a credit against its U.S. taxes for payment of the foreign source income toward U.S. source income. The rules relating to these issues continue to "put U.S. companies at a competitive disadvantage" according to Jim Giarruso, Computervision Corp.'s vice-president for taxes.

Consider the transfer of intellectual property such as software to foreign subsidiaries. The Internal Revenue Service must now treat that transfer as a sale and will impose a tax. As Rob Langer, treasurer of Lotus Development Corp. pointed out, it was possible for many years to get an IRS ruling allowing the transfer to be tax free, but that route is "out the window now." The provision also has the potential for inflicting a significant tax liability. Since the transfer is a sale, whether or not there is profit, some corporate treasurers can outline a horrific [illegible] scenario in which up to a fourfold tax liability occurs as a result of the transfer.

ses voice/data integration.

The manufacturer of the first integrated voice/data switching system considers the issues.

Data is a major factor in office communications today. It's projected that within the next five years, data transmission will increase from the present 2% to 40% of total PBX traffic. That's explosive growth. And it means that companies must accommodate this increase by expanding their present systems or by planning now to replace obsolete systems with ones that can meet those needs.

A look at alternatives.

To keep pace with this change, an organization has two basic choices. First, it can stay with a limited voice-only PBX and create separate data networks. This, however, is a costly, inefficient method, and it becomes increasingly difficult to manage multiple expanding systems.

The second alternative is an integrated voice/data system. By installing one network, a company can have voice and data capabilities at every outlet.

Key benefits are the sharing of resources—devices and software—and consolidated network management. An integrated system is an investment in the future that can pay for itself in the savings of single network administration.

A definition of terms.

Integrated voice/data is sometimes thought of as simply combining voice and data in one switch. But it's really much more. It's the total integration of voice and data through a twisted pair network.

Because a digital system does not distinguish between voice and data, both look the same as they pass through the switch. So it's possible to apply sophisticated voice features to data—least cost routing, conference calls between workstations, callbacks on data terminals and other aids to productivity that are normally associated with voice-only systems.

Major considerations.

Universal Connectivity

One of the greatest challenges facing communications professionals today is the management of changing technology. In an environment where many approaches to office communications call for complete flexibility, only a system designed to be compatible with multi-vendor equipment is a safe choice. Such a system provides the format and protocol conversion capabilities for dissimilar devices to communicate with each other, freeing a company from the need to choose all its equipment from one vendor.

A system should be capable of connecting numerous dissimilar devices to a common network, allowing them to share peripherals, data and functions. This flexibile connectivity also protects your investment in equipment, ensuring its continuing value.

Non-Blocking Traffic

In voice systems, many calls can share one path through the switch because conversations are short and not everyone uses his telephone at the same time. However in data communications each device needs full access through the switch, and the long holding times of data calls place heavy demands on a network. As more data circuits are added to meet growing user needs, a system founded on voice-only design can't handle the traffic and begins to block calls from completion, or to degrade the quality of transmission.

Non-blocking matrix architecture, however, places no restrictions on voice and data access. As the data-to-voice proportions change, the system is reconfigured at the host controller. And there's no new cabling required. In non-blocking systems, savings are soon realized in simplified administration.

Processing Capacity and Speed

Many installed systems operate on 16-bit processors. While this may be adequate power for today's voice-only systems with few data options, it may not be sufficient for tomorrow.

Since a system's processors are the limiting factor, they must offer enough capacity for growth. A system offering 32-bit processors can handle both present and future capacity requirements. It's valuable insurance against obsolescence, with unlimited potential for applications like video and future developments.

The office automation industry is introducing more and more devices that operate at speeds up to 10 Mbps. Only an integrated voice/data system that offers 10 Mbps connectivity and integrated local area networking can successfully carry a company into the automated office environment now evolving.

A view for the future.

In 1979 InteCom introduced the first integrated voice/data system, the IBX™ Integrated Business Exchange, and since then has been setting the pace for the office communications industry.

The system has been proving its merits in installations all across the country for more than three years. It's backed by comprehensive support and refined through an ongoing program of research and development. Software-oriented, adaptive to new technology and protected from obsolescence, the IBX offers you the connectivity needed for tomorrow's automated office.

We hope this look at the issues of voice/data integration will be useful to you in your system selection. InteCom has met the communications requirements of companies in a wide range of industries. And today, our representatives are ready to help you evaluate your specialized needs.

Pansophic buys out Christensen, acquires Telon

By David [illegible]
CW Staff

BOSTON — Pansophic Systems, Inc. completed an acquisition earlier this month aimed at helping the company gain a foothold in the high-end IBM mainframe software market.

On Nov. 1, Pansophic acquired the remaining 85% of the assets of Christensen Systems, Inc. which it did not already own. Christensen, a three-year-old Quincy, Mass., software company, is the developer of Telon, an on-line application development program designed for IBM IMS-DC and CICS operating environments.

Pansophic, a $53-million system software supplier based in Oak Brook, Ill., until now, had no product targeted at the high-end IBM customer. The company hopes the Telon product will enable it to establish a strong position in large IBM shops.

Christensen

David Eskra, Pansophic president and chief operating officer, in a recent interview here said the company wants to gain a foothold in 8,000 to 12,000 of the estimated 33,000 IBM mainframe installations worldwide. Pansophic claimed its present customer base numbers 7,600.

"Telon will elevate Pansophic's reputation in those big IBM shops and will help us sell products at all levels of IBM shops," Eskra maintained. "It allows us to have a more consistent strategy at the customer level, and it allows customers to buy more than one Pansophic product at a time."

"We want to be the market leader," said Alfred Seyler, Pansophic's vice-president and managing director of on-line products. Seyler claimed that no clear market leader has yet emerged in the IBM IMS-DC and CICS arena, in which companies like Informatics General Corp., Cincom Systems, Inc. and Oxford Software Corp. are the major players.

"We fully intend to dominate that market and to dominate it quickly," Seyler asserted.

Eskra

Telon sells for about $100,000, or about twice as much as any previous product in the Pansophic line. Because Telon poses a different kind of marketing challenge, Eskra said, Pansophic, which has a worldwide sales force of 105 people, plans to establish a separate U.S. sales force for the product.

According to Don Christensen, founder and president of Christensen Systems, Telon had been installed at 37 IMS sites, accounting for sales of about $3 million prior to the acquisition. Christensen explained in an interview that his company has been weak in the marketing area and that it lacked the extensive marketing channels a major company like Pansophic can offer.

Eskra said the company plans to continue to expand its product line through acquisitions, while at the same time, placing increased emphasis on in-house research and development.

Last April, Pansophic paid $500,000 to acquire a 15% interest in Christensen Systems. It decided to exercise its option to acquire the remainder of the company for $2 million. As part of the deal, Christensen will also receive royalties for the sale of its products during the next five years.

The acquisition provides that all Christensen personnel will retain their present positions and responsibilities.

CEC to market S1 to Japanese

LAWRENCEVILLE, N.J. — Multi Solutions, Inc. announced recently it had entered into an exclusive five-year agreement with Computer Engineering and Consulting Ltd. (CEC) of Tokyo, for the licensing and distribution of Multi Solutions' S1 operating system to Japanese companies.

Subject to the approval of the Japanese government, the agreement provides that CEC must pay Multi Solutions minimum royalties amounting to about $40 million to maintain the exclusive worldwide rights to license and distribute the operating system and all related products to Japanese computer manufacturers, software designers and other vendors. Multi Solutions said CEC may renew the agreement for an additional five years, in which case CEC must pay additional minimum royalties of approximately $20 million a year for each of the five years.

The S1 operating system is a multiuser, multitasking system said to be capable of operating on almost any computer hardware.

Comdisco reports year-end plunge in profits, posts record revenues

ROSEMONT, Ill. — Computer leasing and brokerage company Comdisco, Inc. recently reported profits of $29.7 million, or $1.05 per share, for the year ended Sept. 30. Year-earlier profits were $51.8 million, or $1.78 per share.

The company said the decline in profits was primarily due to decreased volumes of tax-advantaged transactions, which were suspended during an Internal Revenue Service investigation that was concluded early this year without adverse action being taken. In fiscal year 1982, the company reported profits of $29.3 million.

Despite the IRS review, Comdisco reported record revenues of $558.3 million for the year just ended, compared with $543.1 million last year.

For the fourth quarter of the year just ended, Comdisco reported profits of $8.9 million, or 33 cents per share, compared with year-earlier profits of $15.7 million, or 53 cents per share. Fourth-quarter revenues were $142.6 million, compared with $141.8 million in the previous year.

Kenneth N. Pontikes, chairman and president of Comdisco, said the company "expects a strong resurgence in financial services activities in fiscal 1985."

Data Access reorganization completed under Chapter 11

BLACKWOOD, N.J. — Data Access Systems, Inc., an independent distributor of personal computers, peripherals and supplies, recently announced the consummation of its plan of reorganization under Chapter 11 of the Federal Bankruptcy Act, as earlier approved by the U.S. District Court.

The company said it made cash payments totaling $6.5 million to creditors in partial settlement of allowed claims of approximately $35 million. It also issued to creditors $14.5 million of noninterest-bearing notes and 150,000 shares of its $100 par-value liquidating preferred stock said to be valued at $[illegible] million.

Additionally, creditors received two million shares of common stock and warrants to purchase 400,000 more shares.

David Cohen, chairman and chief executive officer of Data Access, said that during the 20 months the company operated under Chapter 11 protection it "maintained and strengthened its fundamental business." Pointing out that the company recently achieved its first profitable year since 1978, Cohen added, "Now that the company is out of Chapter 11, it is in an excellent position to become even more profitable, and we feel it is on the threshold of a new period of growth."

The company reported revenues of $34.5 million for the year ended in August and said it has a $30 million tax loss carryforward that will enable it not to pay federal income taxes in the near future.

Verbatim trims domestic staff

SUNNYVALE, Calif. — Flexible storage disk maker Verbatim Corp. recently reported a staff reorganization resulting in the reduction of 176 of its professional and support staff at its U.S. locations — a 6% decrease in its worldwide work force.

The company had previously announced a restructuring of its operating divisions and said the reorganization was part of that restructuring.

The company said that no production employees were affected by the reduction whose purpose was to streamline the organization and improve the firm's ability to meet commitments to customers and overall objectives for sales and profitability.

Current production, product introduction and marketing schedules were not affected by the reorganization, the company said.

Vector Graphic earnings slide

THOUSAND OAKS, Calif. — Financially ailing Vector Graphic, Inc. recently posted a first-quarter loss of $1.8 million, or 24 cents per share, on a sharply declined revenue base.

Vector Graphic, which earlier had announced its intention to seek to be merged or acquired, saw its revenues decline to $2.1 million from year-earlier revenues of $6 million. The loss in the first quarter compared with a year-earlier loss of $701,000, or 12 cents per share.

The firm noted that in response to declining sales, it had previously reduced its work force by 66%, or roughly 100 employees. Expenses for the quarter were reduced to $4.1 million, compared with $7.2 million in the first quarter last year.

S.I.S.S.Y (sis'ē) n. A smart data processing professional who has used Single Image Software™ to solve multiple-CPU related problems.

Whether your company has ten mainframes or just brought in its second computer, a multi-processor configuration that shares DASD complicates your operation. S.I.S. is the high performance family of Single Image Software products that makes things simple again for everyone, from technical staff to operations people, right through to end users.

Transparently, S.I.S. products work across all systems to safeguard data integrity, speed up the accurate flow of information and dramatically streamline operations. S.I.S. helps bring your multi-system complex up to peak performance while saving time, money and valuable on-staff talent.

SUPER
MSI

Multiple-CPU's let you distribute workload between systems. Sharing DASD moves the jobs even faster. But what about the bottlenecks and job back-ups when hardware RESERVEs lock out entire devices? What are you doing to protect files from being clobbered when two users inadvertently modify the same dataset simultaneously?

If you're a S.I.S.S.Y, you give the problem to Super-MSI,™ the Single Image Software Multiple Systems Integrity facility. Super-MSI eliminates RESERVE lockouts and insures data integrity in a shared DASD environment. With no complicated job scheduling, elaborate control schemes or extensive software changes, Super-MSI guarantees your data integrity and eliminates your problems.

MSM

Do you want to save your operators from the tedious and error-prone chore of manual tape monitoring? Prevent tape overwrites? Relieve your budget of duplicate hardware costs and your systems staff of job reruns?

As every S.I.S.S.Y knows, you solve the problems of sharing devices in your multi-system complex with MSM®.

MSM, the Single Image Software Multiple-Systems Manager, automatically manages the allocation of shared tape and mountable disk drives across all systems in your complex. With MSM, your operating system controls which system can use which tape drive right now so your operators can concentrate on more productive tasks.

GCD

In a multi-system environment, monitoring systems can become a real run-around with an operator going from console to console reading messages, issuing commands, and responding to replies.

GCD,® the Global Console Director, is another valuable and powerful S.I.S. aid that routes all system messages through one console, taking streams of console messages and blending them into one. GCD allows each individual console in your complex access to and information from all systems in the complex, saving operator time, reducing hardware costs and improving operations. As a S.I.S.S.Y, you may find your hardware savings exceeding the cost of Single Image Software!

Single Image Software gives shared DASD users multiple CPU power with the operational simplicity of a single unit system.

It's no wonder more and more shared DASD users worldwide are proud they've turned S.I.S.S.Y. It's why you should, too. For more information on Single Image Software, call 800-237-9057. (In Florida, call (813) 963-5011.) Or be a S.I.S.S.Y free by just calling today for a 30-day trial of Single Image Software in your data center.

I'm sold on S.I.S.

CDC to sell credit company, acquires Visicorp subsidiary

MINNEAPOLIS — Control Data Corp. announced recently that it intends to sell its Commercial Credit Co. and related financial businesses. It was also announced that CDC had acquired Communications Solutions, Inc. (CSI) from Visicorp for approximately $5 million in cash.

The Commercial Credit unit was purchased in 1968 and served initially to finance CDC computer sales. CDC said it hopes to complete a sale by mid-1985 and focus more on its computer operations.

Profits at CDC have taken a decided downward turn for the first nine months of the current fiscal year to $600,000, compared with $113 million for the comparable period a year earlier.

The purchase of CSI follows an earlier move to acquire the rights to Visi On from Visicorp along with the absorption of the Visi On development team.

Robert Howell, director of business development for Control Data Software Co., said the acquisition addressed his company's focus on mainframe communications. CSI will operate as an autonomous unit of Control Data Software.

Lee Data to gain Visual Technology through stocks

MINNEAPOLIS — Lee Data Corp. will acquire Visual Technology, Inc. of Tewksbury, Mass., through an exchange of common stock valued at about $16.8 million, the two companies announced last week.

According to a preliminary letter of intent approved by the boards of directors of both companies, Lee Data will exchange one-half a share of its common stock for each share of Visual Technology's 4.9 million shares of common stock outstanding.

As a wholly owned subsidiary of Lee Data, Visual Technology will be operated by its current management, the companies said. Thomas R. Foley, president and chief executive officer of Visual Technology, will become an officer of Lee Data and a member of its board of directors, according to the planned merger.

Visual Technology, a manufacturer of asynchronous terminals, the Commuter portable computer and the Visual 2000 multiuser system, is expected to have its credit facility increased from $19 million to $22 million and, on completion of the merger, to $25 million, with the additional $3 million guaranteed by Lee Data. Additionally, Lee Data will make $3 million of additional financing available to Visual Technology, according to spokesmen.

Lee Data's sales force will market Visual Technology's products, the spokesmen said.

Firm's president indicted for chip trade violations

By Charles Babcock
CW New York Bureau

NEW YORK — The president of International Processing Systems GmbH, a West German firm, was recently indicted by a federal grand jury here for conspiring to smuggle semiconductors to North Korea.

Babeck Seroush was indicted on six counts of violating the Trading with the Enemy Act, with a possible penalty of 10 years' imprisonment and a $50,000 fine on each count, according to Rudolph W. Giuliani, U.S. attorney for the Southern District of New York.

Without informing companies of their destination, Seroush attempted to purchase the following parts, according to the indictment: 10,000 pieces of National Semiconductor Corp. part MM 54C373J; 6,000 pieces of Texas Instruments, Inc. part number SN 54LS154; and 4,200 hybrid integrated circuits designed as components for night vision goggles. All were designed for use at the temperature extremes required for military applications, Giuliani said.

Bound for North Korea

The parts were slated to be shipped to International Processing Systems in Cologne, West Germany, where they would be diverted to North Korea, according to the indictment.

Companies that were approached by Seroush included: Analog Devices, Inc. of Norwood, Mass.; Jaco Electronics, Inc., of Hauppage, N.Y.; Kemet Capacitors of Union Carbide Corp., Tarrytown, N.Y.; and Schweber Electronics of Westbury, N.Y.

Seroush, a 38-year-old Iranian national, until recently had homes in Westport, Conn., and New York as well as Germany. He has been arrested by German authorities for possible extradition to the U.S. to stand trial, Giuliani said.

Announcing

The one-stop, international advertising service for micro marketers.

You'll reach microcomputer buyers all over the world with *Computerworld's* International Marketing Service (CWIMS). Because we have the microcomputer market *covered* with an international network of publications. And what a market!

As the need for computerization in government, industry and educational systems all over the world becomes more acute, countries look to the cost-effective, adaptable microcomputer to bring them into the computer age. This means a very lucrative market for the U.S. micro marketer, since international product demand exceeds product supply.

Now, with the help of *Computerworld's* International Marketing Services, you can advertise in twenty magazines devoted exclusively to supplying information to microcomputer users in: Australia (*MicroWorld, Australian PC World*), Brazil (*MicroMundo*), Canada (*PC World Canada*), Denmark (*Micro Verden*), Finland (*Mikro*), France (*Golden, OPC*), Japan (*PersoCom World*), Mexico (*Compu Mundo*), Norway (*Mikro Data, PC Mikrodata*), Sweden (*MicroDatorn, Min Hemdator*), Spain (*Micro Sistemas*), Sweden (*Svenska PC World*), The Netherlands (*Micro/Info*), West Germany (*MicroComputerwelt, PC Welt, Run*). And your advertising message can reach buyers of microcomputer products and services around the world through special micro sections in any of over 40 publications in 25 countries.

Act now—and take advantage of this international demand for microcomputer products. Whether you want to test the market—or locate a distributor or representative—our publications will put you in touch with the right people around the microcomputer world.

For more information on getting international micro coverage, call Diana La Muraglia, General Manager, International Marketing Services, toll-free, at 800-343-6474. In Massachusetts, call 617-879-0700 or return the coupon below.

Tandem doubles revenue with help from tax break

CUPERTINO, Calif. — Tandem Computers, Inc. recently reported that its fourth-quarter profits more than doubled to $21.8 million, or 53 cents per share, from $8.7 million, or 21 cents per share, a year earlier.

The company's profits were boosted by a one-time gain of $9.7 million, or 24 cents per share, resulting from a change in the tax law governing overseas operations.

Revenue for the quarter ended Sept. 30 increased 30% to $153 million, compared with $117.8 million during the same period one year earlier.

For fiscal year 1984, Tandem's revenue rose 27% to $532.6 million from $418.2 million during fiscal 1983. Profits for the year, including the $9.7 million tax benefit, were $42.9 million, or $1.04 cents per share, compared with $30.8 million, or 76 cents per share, the previous year.

James G. Treybig, president and chief executive officer, said sale of the company's high-end Nonstop TXP computer system, which was introduced last year, was the major contributing factor to revenue growth.

Nonrecurring items boost PE quarterly sales income

NORWALK, Conn. — Perkin-Elmer Corp. recently reported that first-quarter profits were $17.5 million, or 39 cents per share, compared with $8.8 million, or 20 cents per share one year earlier.

The profits included nonrecurring items that increased profits by $4 million, equivalent to 9 cents per share, and the company said profits without those items would have been $13.5 million, or 30 cents per share, a 53% increase over the same period on year earlier.

Sales revenue for the quarter ended Oct. 31 was $286 million, a 14% increase over the previous year.

Horace G. McDonald Jr., president and chief executive officer, said the company held the rate of increase in operating expenses below that of sales increases and the company experienced increases in new orders as well as in its backlog of unfilled orders.

Sales for the company's Data Systems Group were $60.2 million, up from $53.6 million a year earlier, and Semiconductor Equipment Group sales were $66.2 million, up from $49.4 million during the same period one year earlier.

Paradyne posts profit increase

LARGO, Fla. — Paradyne Corp. recently reported a 51% increase in third-quarter revenue and a 295% profit increase compared with the third quarter a year earlier.

Revenue for the three months ended Sept. 30 was $76.1 million, compared with $50.3 million a year earlier. Profits for the quarter just ended were $3.1 million, or 14 cents per share, compared with year-earlier profits of $804,000, or 4 cents per share.

Robert S. Wiggins, chief executive officer of Paradyne, expressed pleasure with the company's revenue and order rates during the third quarter but noted that "the international order rate appeared to be dampened by the effect of the strong dollar abroad."

EXECUTIVE CORNER

Jerome Meyer will join Varian Associates, Inc. in the newly created position of president and chief operating officer on Dec. 3.

■

Jonathan Yu has been appointed president and chief operating officer at Applied Micro Circuits Corp. Yu previously had been employed at TRW, Inc. and Burroughs Corp.

■

Frank Burcher has been named president and chief executive officer of Molecular Computer, Inc.

■

W. Kyle Willis, who recently joined TCS Software, Inc. as chief financial officer, has been appointed president and chief executive officer of the company.

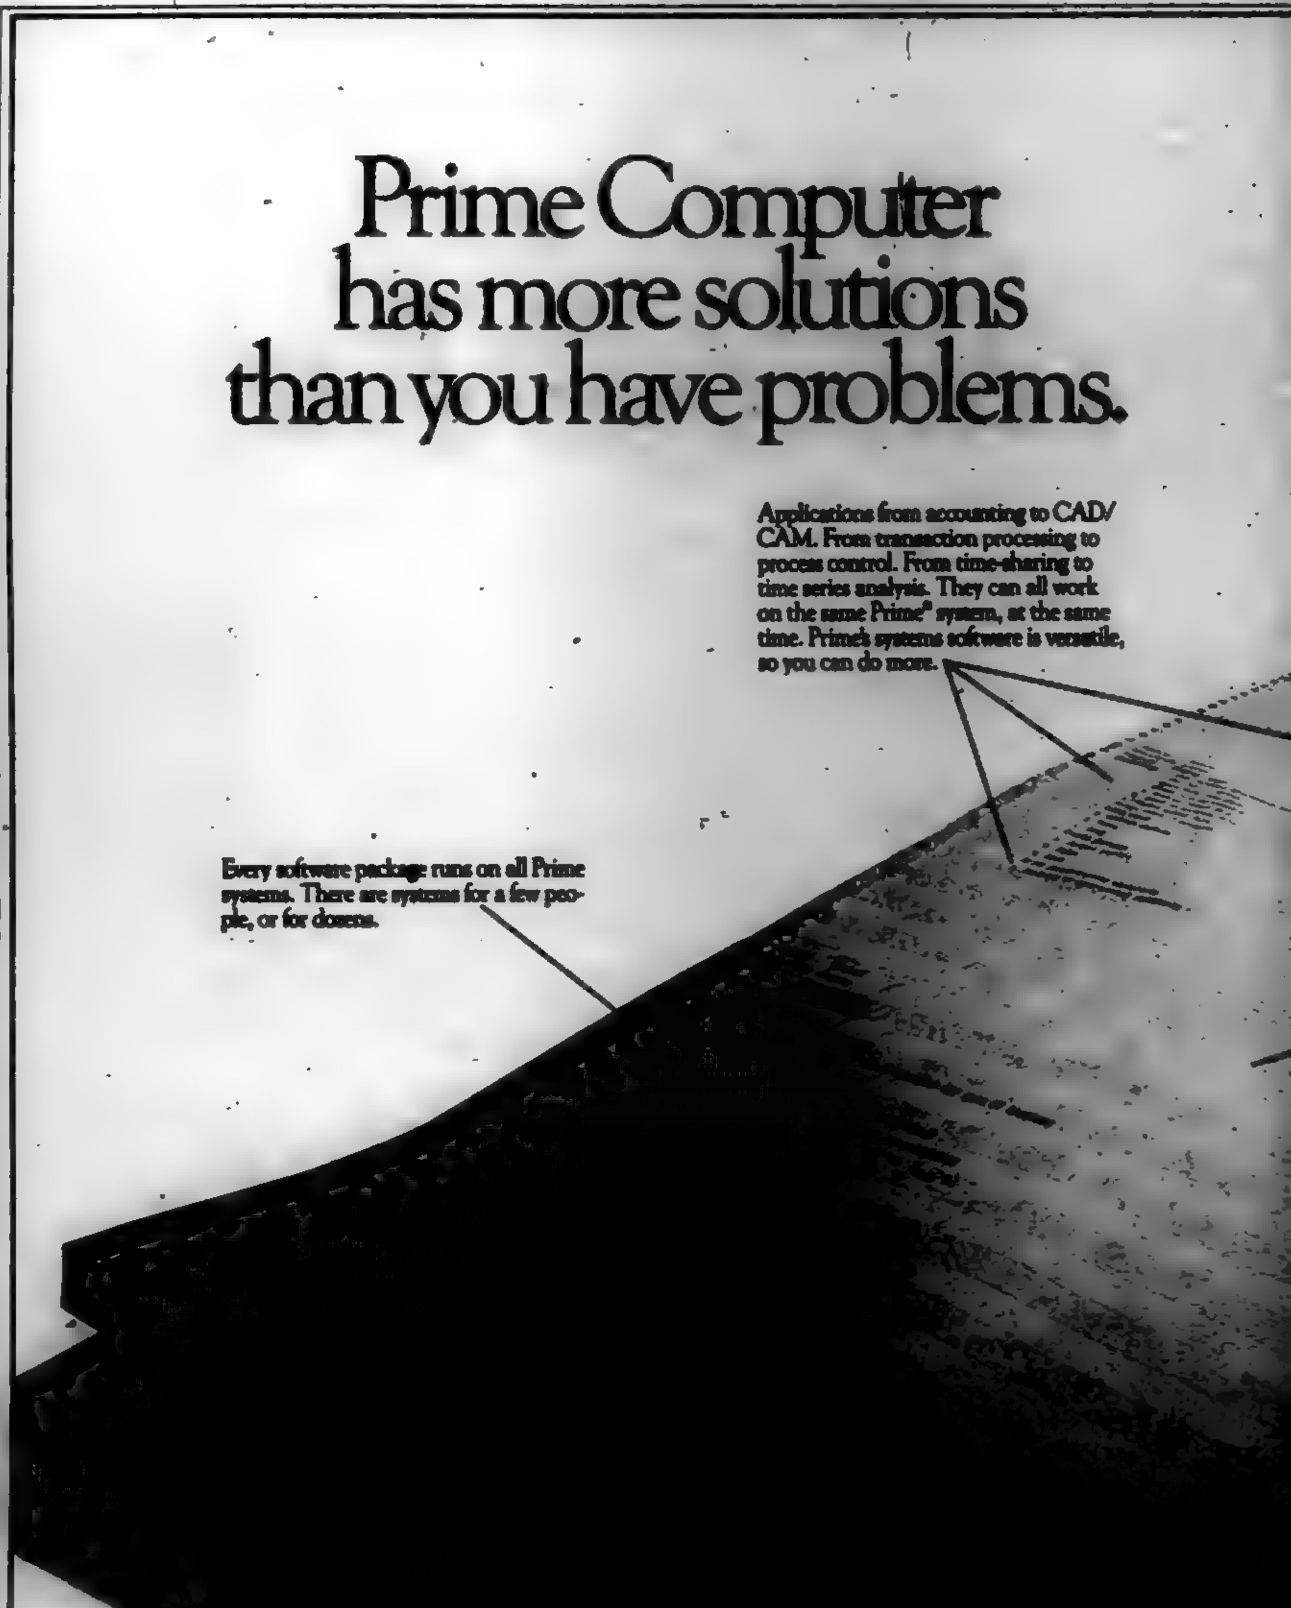
■

F. William Stamper has been appointed president of the MDS Systems Divison at Mohawk Data Sciences Corp. (MDS). Prior to joining MDS, Stamper worked for Control Data Corp.

■

William Porter has been appointed to president, chief operating officer and member of the board of directors

See EXEC page 84



Prime Computer has more solutions than you have problems.

Applications from accounting to CAD/CAM. From transaction processing to process control. From time-sharing to time series analysis. They can all work on the same Prime® system, at the same time. Prime's systems software is versatile, so you can do more.

Every software package runs on all Prime systems. There are systems for a few people, or for dozens.

Cray Research sales up despite increased competition

By Charles Babcock
CW New York Bureau

NEW YORK — Cray Research, Inc.'s sales are increasing at a time when it faces growing supercomputer competition at home and abroad.

Cray Chairman John A. Rollwagen told the New York Society of Security Analysts recently that the Minneapolis-based supercomputer maker expects to install 21 multimillion-dollar systems in 1984. Last year it installed 16; next year it expects to install 30, Rollwagen said.

"If someone orders today, we have to say, 'Sorry, but we can't deliver until the first quarter of 1986, 15 months from now,'" he said.

Expects orders to grow

Still, the pace of orders is expected to grow, Rollwagen said. Forty-five prospects have submitted a written or verbal order for a Cray machine, and 24 of those ordering are new customers. New customers make up almost three-fourths of the prospects that are currently querying Cray, he added.

When asked if Cray, which is used to selling a handful of $6.5 million to $20 million machines a year, could ramp up production, Rollwagen answered by noting that in the past, Cray customers have been reluctant to say they would be willing to buy a new model three years down the road, so Cray forecasters would say demand was likely to decline in three years.

Now, Cray "is taking the courageous step" of predicting that demand will remain steady, rather than decline, and it is increasing production accordingly, he said.

While the bulk of Cray's customers continue to be government and university laboratories, Rollwagen said a growing share are commercial companies, such as the Ford Motor Co., which uses a Cray machine to simulate auto crashes.

Demand strongest for multiprocessor units

Rollwagen indicated that the demand is strongest for its X-MP/2 or X-MP/4 dual and quadruple processor units. "We misjudged to some extent the demand for the top of the line," he said.

He noted that the appetite for supercomputing power is driven by the desire to simulate physical phenomena, such as aircraft flying or atmospheric conditions.

John F. Carlson, Cray's chief financial officer, reported that the company garnered a revenue of $71.6 million and net earnings of $19.6 million, or $1.32 per share, in the third quarter ended Sept. 30. Revenue in the third quarter last year was $31.4 million, with a net income of $2.8 million, or 19 cents per share.

CRAY

from page 73

They worry that they will not get the most advanced components until two years after they have appeared in Japanese computers. Cray has developed its own gallium arsenide manufacturing capability to avoid becoming dependent on its competitors, according to Rollwagen; its first attempts have not yielded wafers with working chips.

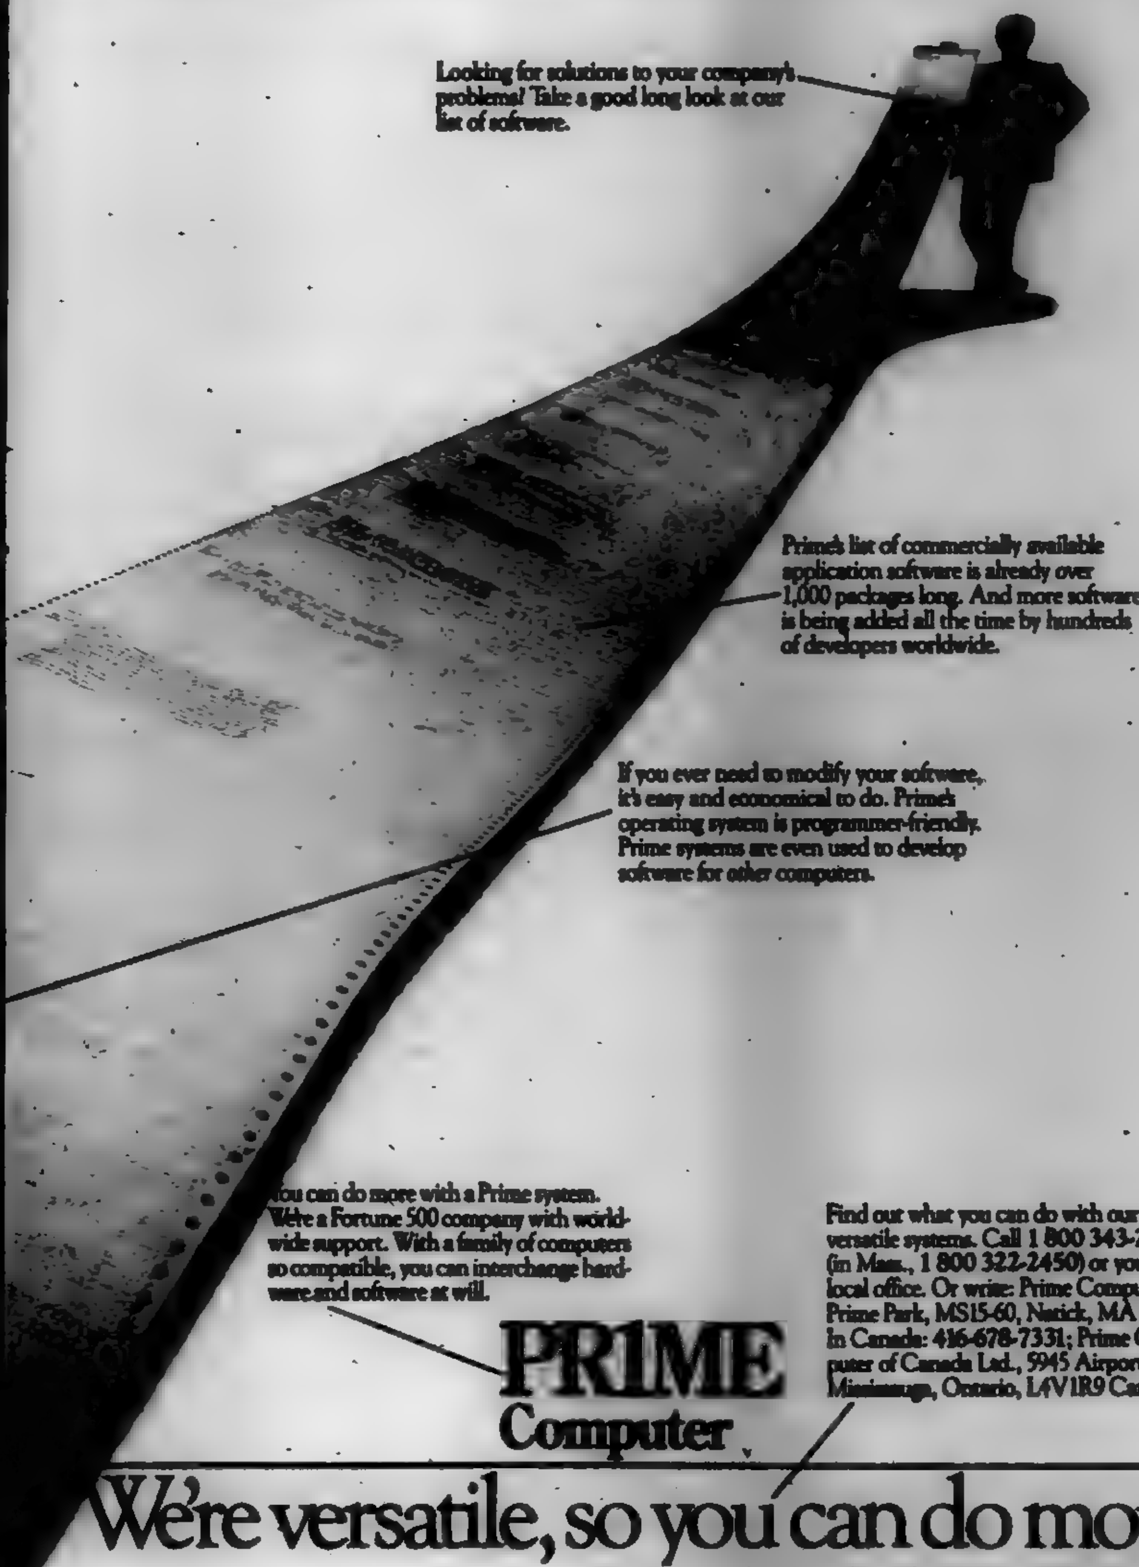
Japanese may have edge

Browne said taking the step to gallium arsenide components was risky, adding that the Japanese may have an edge in designing gallium arsenide chips.

A start-up company, ETA Systems, Inc. of St. Paul, Minn., an offshoot of Control Data Corp. of Minneapolis, is designing a supercomputer with Cmos chips that are slower than ELC or gallium arsenide but contain a very high density of components per chip. The chip is being designed to execute 10 billion floating-point operations per second and is scheduled to be available in the second half of 1986, ETA spokesmen said.

Rollwagen claimed Cray had a two-year lead on Hitachi and Fujitsu because the Japanese firms were still field-testing their new models and needed more time to develop them. Spokesmen for Fujitsu and Hitachi America Ltd. disputed the claim, saying they were past field-testing and were installing units at locations in Japan.

Amdahl Corp. of Sunnyvale, Calif., which markets Fujitsu supercomputers in the U.S. as the Amdahl 1100 and 1200, said they will be available in the second quarter of 1985. Hitachi has not decided yet whether it will market its S-810 and S-820 supercomputers in the U.S., Hitachi spokesmen said.



Looking for solutions to your company's problems? Take a good long look at our list of software.

Prime's list of commercially available application software is already over 1,000 packages long. And more software is being added all the time by hundreds of developers worldwide.

If you ever need to modify your software, it's easy and economical to do. Prime's operating system is programmer-friendly. Prime systems are even used to develop software for other computers.

You can do more with a Prime system. We're a Fortune 500 company with worldwide support. With a family of computers so compatible, you can interchange hardware and software at will.

Find out what you can do with our versatile systems. Call 1 800 343-2540 (in Mass., 1 800 322-2450) or your local office. Or write: Prime Computer, Prime Park, MS15-60, Natick, MA 01760. In Canada: 416-678-7331; Prime Computer of Canada Ltd., 5945 Airport Road, Mississauga, Ontario, L4V1R9 Canada.

SECRETS

from page 73

ganization last June.

In a book to be published next month, Palo Alto, Calif., attorney Robert Spanner likens trade secret litigation to "an excursion into the realms of hell." In a recent interview with *Computerworld*, Spanner, a trade secret specialist with Beckford, Spanner & Kelley, described the "devastating" costs that often result when a computer company gets involved in trade secret lawsuits.

Trade secret cases, Spanner said, "consume the attention and passions of management and are amazingly disruptive [to] the operations of the company." He said the damage can be particularly severe for a start-up company that is hit even by the threat of a lawsuit. Even if the start-up is able to defend against the charges successfully, the financial and emotional costs may doom the planned venture.

"One very important strategic consideration," Spanner noted, "is that as soon as word gets out to the stock market that there is a trade secret litigation instituted or threatened, [investors and customers] will avoid you like the plague."

Spanner said he believes trade secret litigation is on the increase in the computer industry. He said he counsels his clients to avoid such lawsuits "at all costs."

In his book, Spanner writes that one of the stickiest areas of trade secret law is differentiating between proprietary information, which a company's employee — in signing a nondisclosure agreement — promises not to reveal should he leave the company, and the employee's general knowledge and experience, which he is free to use as he wants.

"Courts have had a great deal of difficulty in differentiating an employee's knowledge from company proprietary information," he said. Spanner said that judges are sometimes uncomfortable with these suits because of the "fundamental considerations of personal autonomy involved." A judge must weigh such factors as the use of information that exists in the privacy of an individual's thoughts and an employee's freedom to move from one job to another and to better himself economically, he noted. There are, of course, important economic interests at stake, too; for example, promoting U.S. R&D to help the country's competitive position vis-a-vis foreign companies.

Spanner believes that trade secret law is in a state of general disarray. "Cases presenting similar circumstances are being decided in diametrically opposite ways," he maintained. He would like to see state legislatures consider this complex issue and adopt some kind of uniform statutes.

"It's important to prevent and avoid cynicism on the part of the public with any facet of the law," Spanner said. "I think the word is going to get out that there is no predictability in the trade secret area, and that it depends on who the judge is and whether he likes you. I think that is socially dangerous."

EXEC

from page 82

tors at Startel Corp.

■

Nancy Goodhue was named vice-president of Datatel Minicomputer Co.

■

William Morgan has been promoted to the newly created position of senior vice-president of product operations at Memorex Corp. Prior to working at Memorex, Morgan was employed by Texas Instruments, Inc.

■

Louis Clark has joined Integrated Planning, Inc. as vice-president of product development.

■

Honeywell, Inc. announced the following promotions to group vice-presidents: **Charles Johnson**, large computers and manufacturing systems; and **Eugene Manno**, small computers and office systems.

■

Andrew Knowles has been appointed corporate vice-president at Prime Computer, Inc. Knowles previously worked for Lexidata Corp. and Digital Equipment Corp.

■

George Perlegos, vice-president of engineering, has resigned from Seeq Technology, Inc.

■

Lee Data Corp. announced the appointments of **Douglas Pihl**, senior vice-president of corporate development; and **Don Miller**, vice-president of product development.

■

James Hart has been appointed to the newly created position of senior vice-president and chief operating officer at Avanti Communications Corp.

■

Edward F. Eddy has resigned his position of vice-chairman at NEC America, Inc. to join Ambi Corp. as chairman.

Stephen S. Yau was elected president of the American Federation of Information Processing Societies following the National Computer Conference this past summer. **Per A. Holst** was named vice-president, **Herbert B. Safford** was named secretary, and **Rolland B. Arndt** was named treasurer of the federation. Yau is a professor and chairman of the Department of Electrical Engineering and Computer Science at Northwestern University.

■

Victor D. Poor has resigned as an executive vice-president of Datapoint Corp. and will become a technology consultant to the chairman and chief executive officer of the company.

■

Donald W. Gouldsmith has been appointed to the position of president and chief executive officer at Madic Corp. Former president **Richard Wilke** becomes chairman of the board.

Reach the Danish computer market with Computerworld/Denmark.

The Danish EDP market is growing at an incredible rate of 23% annually. Last year, this market was valued at more than $185 million. And the U.S. is Denmark's major supplier of EDP products accounting for 40% of the country's computer equipment imports.

When Danish computer professionals with purchasing power want the most up-to-date local and international information on the EDP industry, they read *Computerworld/Denmark*, sister publication to *Computerworld*. *Computerworld/Denmark* is a bi-weekly newspaper serving the Danish computer community with the latest developments in hardware, software, terminals and other computer products and services. And, in every issue, the *MicroWorld* section reports on the special needs of the micro end-user and the status of the market.

So, if you'd like to market your products or services internationally, *Computerworld/Denmark* has a circulation of 20,000 computer professionals who would like to hear from you.

CW International Marketing Services will give you one-stop advertising service in countries around the world. We will translate your ad and bill you in U.S. dollars. For more information on *Computerworld/Denmark* or any of our other foreign publications, just fill out the coupon below.

IBM PC Workstation–$1595.00

Santa Clara Systems makes your investment in the IBM PC, PC XT or PC AT look even better. Now, everyone in the office can afford to have an IBM PC at their fingertips. Without buying additional computers, and for a fraction of their cost. Only $1595.

The Santa Clara Systems PCterminal, complete with keyboard and monitor, easily connects to any existing PC, PC XT or PC AT allowing you to share the data and resources you already have on hand—hard disk drives, printers, graphic plotters and the like.

Built-in local area networking makes it possible.

PCterminal won't limit your existing PC's performance either. Because it has its own 8088 microprocessor and 64 KB of random access memory, expandable to 256K.

Very intelligent indeed.

But that's not all. Built-in parallel and serial ports, along with four expansion slots enable you to add a host of peripherals, as well as additional memory, graphics cards and other productivity enhancers.

The Santa Clara Systems $1595 PCterminal. A small price to pay for a big gain in productivity.

You won't find a better value anywhere. Your local Santa Clara Systems distributor can prove it. Call and order yours today.

MERGERS AND ACQUISITIONS

Avant-Garde Corp. announced recently it has reached an agreement in principle to acquire 100% of the common stock of **Human Engineered Software Corp.** (HES). HES will become a wholly owned subsidiary of Avant-Garde.

Final settlement will depend on Avant-Garde reaching a conclusive agreement with HES' principal secured lender. HES last month filed for relief under Chapter 11 of the Federal Bankruptcy Act. The bankruptcy court must also approve an HES plan of reorganization.

■

Anacomp, Inc. announced that the board of directors of its majority-owned subsidiary **USA Communications, Inc.** has approved an agreement in principle for the sale of substantially all of the assets of USA Communications to **Outlet Communications, Inc.**, a wholly owned subsidiary of the Rockefeller Group, a private company owned largely by the Rockefeller family.

The $22 million cash sale is subject to the execution of a definitive agreement and necessary USA Communications stockholder and regulatory approvals. On a fully diluted basis, assuming exercise of all outstanding warrants and options and the retirement of USA Communications' retained liabilities, the purchase price is equivalent to approximately $3.10 per share of USA Communications common stock. Anacomp owns 2.4 million shares of USA Communications common stock.

■

Bell & Howell Co. announced that it has agreed to purchase certain assets of 3M Co.'s computer-output microfilm (COM) business. A COM system electronically transfers data from a computer directly onto microfilm instead of paper and is the most economical computer data storage method available.

■

Honeywell, Inc. and **Digital Datacom, Inc.** have announced that they have signed an agreement providing for a merger whereby Honeywell will acquire Digital Datacom, a Laguna Niguel, Calif., maker of work center manufacturing systems, for $10 million in cash. The two companies had signed a memorandum of understanding in August.

■

Data I/O Corp., Redmond, Wash., and **Futurenet Corp.**, Canoga Park, Calif., jointly announced that they have entered into a definitive agreement associated with the Data I/O's acquisition of all of Futurenet's outstanding shares in exchange for 2.16 million shares of Data I/O common stock, which had been announced in late August.

The acquisition will be accomplished through the merger of a Data I/O subsidiary and Futurenet and will be considered a pooling of interests. The transaction is conditioned upon certain regulatory filings and approval of Futurenet's shareholders.

■

MSI Data Corp. entered into an agreement in principle to acquire **Azurdata, Inc.** of Redmond, Wash., for an undisclosed amount.

Completion of the transaction is subject to execution of a definitive agreement that must be approved by the boards of directors of both companies and by the Azurdata stockholders.

■

NCA Corp. announced it has agreed to acquire **The Systems Practice, Inc.** for an undisclosed amount of NCA common stock. Terms of the acquisition were not available.

SUPERSHORTS

Miniscribe Corp. has signed an agreement with **Arrow Electronics, Inc.** to distribute Miniscribe's entire line of Winchester disk drives. Lawrence J. Klassen, vice-president of marketing at Miniscribe, said the contract is a multiyear agreement with a potential value in excess of $20 million.

■

AT&T Information Systems and **The Computer Store, Inc.** announced an agreement whereby The Computer Store will market the AT&T personal computer and accessories in their 12 stores located in New England and the mid-Atlantic states. Terms of the agreement were not available.

■

Relational Technology, Inc. and **Burroughs Corp.** signed an OEM pact granting Burroughs the right to distribute Relational's Ingres relational data base management system with its new supermicrocomputer. Terms of the agreement were not available.

■

Savenet, Inc., CP National Corp., American Network, Inc. and **Pacific Telecom, Inc.** announced they have reached agreements in principle for the merger of the discount long-distance telephone services of Savenet and CP National's passport operations into American Network, a publicly held company. The agreements are subject to the approval of the boards of directors of all companies. The transaction is expected to be completed by late November.

■

Stratus Computer, Inc. announced the formation of two key corporate departments intended to enhance further the company's ability to deliver advanced products.

Hardware and software development have been consolidated into a single engineering department. A newly created group focused on emerging technologies and business opportunities also has been formed.

■

Charles River Data Systems announced an agreement worth an estimated $5 million to deliver 275 of its Universe 68 computer systems and Unos operating system software to the People's Republic of China over the next 18 months. At the same time, the company received a specific contract to ship the first $1 million worth of hardware and software.

■

Perex Microsystems, Inc. announced the formation of a new division called **Perex Information Systems** (FIS). Lead by Dr. Timothy Hallinan, FIS will develop a series of products to present a range of business, social, economic and financial statistics in a concise format on single diskettes.

■

Vitalink Communications Corp. and **Digital Equipment Corp.** announced an agreement under which the two companies will cooperatively market a hardware and software product called Transian that transparently connects local-area networks via satellites and/or terrestrial lines.

The agreement calls for Vitalink to receive a technology license from DEC as well as cooperatively market Transian with DEC. Transian will be sold, serviced and supported by Vitalink.

■

Ashton-Tate announced it has signed a $10 million contract with French software distributor **La Commande Electronique** to distribute Ashton-Tate's current business software products in France. Terms of the agreement were not disclosed.

■

Visual Technology, Inc. announced that it will be moving its New York printed-circuit board assembly operations to its principal manufacturing facility in Massachusetts. Work force reductions will result in the termination or layoff of approximately 190 employees, primarily in New York.

See SUPER page 69

STC

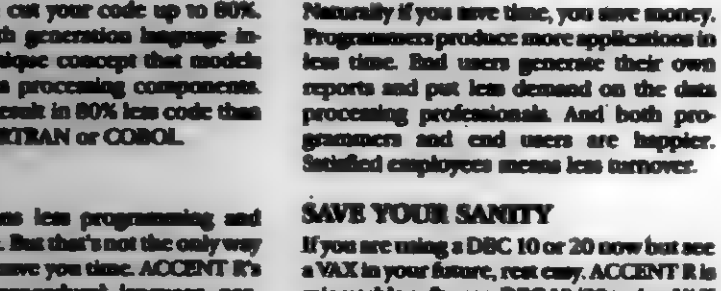
from page 73

shareholders, creditors, employees and customers."

The meeting was called by the trustee to form a creditors committee to review and make recommendations on the company's financial plans as part of the court-monitored reorganization. At the time of that meeting, the company announced the filing of a petition to place another subsidiary, Media Technology Corp., under Chapter 11 protection for reorganization.

Aweida told the creditors the company expects to emerge from reorganization as a "stronger, possibly smaller, but more competitive operation." He said the company is optimistic about its core business of providing storage tape and disk products and is excited about its optical disk products.

ACCENT R CUTS CODE 80%!



More power for your DEC-10/20, VAX*

CUT CODE

ACCENT R can cut your code up to 80%. ACCENT R's 4th generation language incorporates a unique concept that models the various data processing components. These models result in 80% less code than required by FORTRAN or COBOL.

SAVE TIME

Less code means less programming and debugging time. But that's not the only way ACCENT R can save you time. ACCENT R's powerful non-procedural language provides a complete range of commands so end users can easily add, change and delete data items.

CUT COSTS

Naturally if you save time, you save money. Programmers produce more applications in less time. End users generate their own reports and put less demand on the data processing professionals. And both programmers and end users are happier. Satisfied employees means less turnover.

SAVE YOUR SANITY

If you are using a DEC 10 or 20 now but see a VAX in your future, rest easy. ACCENT R is migratable software. DEC 10/20 today, VAX tomorrow. A syntactically identical version makes migration easy; special pre-release pricing makes it affordable.

*VAX version available late 1984

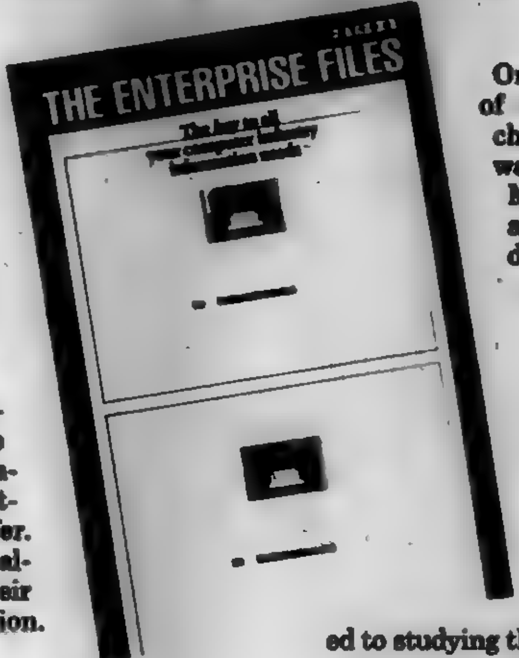
Send for this FREE brochure and find out why the Enterprise Files may be your most important marketing tool

The Enterprise Files from International Data Corporation give you the detailed sales information you need to stay ahead in today's competitive computer market.

Now you can locate prospective clients, fine-tune your promotional campaigns, and track competing companies. And you'll do it all quickly, easily, and accurately.

When you subscribe to the Enterprise Files you'll get up-to-date facts on more than 13,000 companies and the 35,000 computer-related products & services they offer. Many leading organizations have already made the Enterprise Files their number one source of information. Here are four reasons why. . .



1) Comprehensive listings

The Enterprise Files are divided into two general categories, Vendor Files and Product Files.

Each vendor profile includes: company and division names, parent company, address and telephone number, type of company, number of employees, years in business, target industries, target applications, key corporate executives, geographic coverage, and product/service offerings.

Every product profile includes: price, model number, date of introduction, the number of installations, channels of distribution, and market status. Also, each product or service is researched individually, with up to 25 product-specific characteristics identified.

You'll get everything you need to compare product specs and contact vendors.

2) Custom packaging

No matter which companies and products interest your organization, you can get the information you need, the way you need it. Because the Enterprise Files are available in three ways. You can choose the complete file, any of 26 standard subfiles, or custom packaging. So you'll pay only for what you need.

3) Easy to use

Once you've determined what kind of information you need, you can choose between three convenient ways of receiving your information. Magnetic tape for permanent storage, pressure sensitive labels for direct mail promotions, and hard copy for a handy resource tool.

4) Accurate listings

The information in the Enterprise Files is gathered and updated daily by International Data Corporation. IDC has been the leading market research firm covering the information processing industry for 20 years. And IDC is the only firm solely dedicated to studying this market. So you can rely on the information in the listings.

Send for your FREE brochure today

Can you afford to be without this kind of detailed information about your industry? Put the Enterprise Files to work for you. Call Mike Hovagimian today to get your FREE copy of our brochure. It describes what the Enterprise Files are, what your custom packaging options are, and includes a rate sheet. Call right now. You can reach Mike at (617) 872-8200.

Or, if you prefer, fill out the coupon below and return it today.

NICKELS AND DIMES

Computer Sciences Corp. reported profits for the second quarter ended Sept. 28 were $3.4 million, or 25 cents per share, compared with $4.4 million, or 32 cents per share, for the year-earlier period. Revenues were $172 million, compared with $184.4 million in the corresponding period last year.

The lower profits resulted primarily from an expected decrease in international revenue and higher interest expenses, due to bank borrowings, according to William Hoover, chairman and president of Computer Sciences.

■

Masstor Systems Corp. announced that revenues in the third quarter ended Sept. 30 increased to $6.1 million, compared with $4.8 million in the comparable period one year ago. Net loss for the quarter was $3.8 million, or 24 cents per share, compared with a net loss of $3.2 million, or 22 cents per share, in the same quarter last year.

■

Stratus Computer, Inc. reported revenues for the third quarter ended Sept. 30 were $11.1 million, an 87% increase from $5.9 million in last year's quarter. Profits were $1.5 million, or 8 cents per share, compared with $695,000, or 4 cents per share, in the corresponding period one year ago.

■

Zentec Corp. announced revenues for the third quarter ended Sept. 29 of $6 million, compared with $5.4 million for the same period one year earlier. Profits were $101,000, or 3 cents per share, compared with a net loss of $950,000, or 28 cents per share, in the same quarter last year.

■

Keane, Inc. reported profits for the third quarter ended Sept. 30 of $169,000, or 19 cents per share, up from $8,000, or 1 cent per share, a year ago. Revenues were $8.9 million, up 72% from $5.1 million for the same quarter one year earlier.

■

Cray Research, Inc. announced revenues for the third quarter ended Sept. 30 were $71.6 million, compared with $31.3 million in the same period a year ago. Profits were $19.5 million, or $1.32 per share, compared with $2.8 million, or 19 cents per share, for last year's quarter.

The International Software Market for the world's Software Industry

The Montreal International Software Market (MIM) is the first truly international exhibition and conference exclusively for the world's software trade.

Montreal, Canada June 3, 4, 5, 1985, is the setting for this unprecedented global interaction of software professionals — buyers, sellers, importers, exporters, authors, distributors and volume end-users.

EXHIBITIONS
- Software for micro, mini, mainframes
- Products & related services

CONFERENCES
- Product design & development for export
- Export profitably
- Software & copyright protection

WORKSHOPS
- How to access world markets
- Trading patterns
- Export problems & solutions

XEROX

from page 73

IBM has chosen to set the hardware standard in manufacturing systems, with a technical hardware umbrella covering everything from the 4361 to a serial OEM interface to a workstation adapter for factory robots.

Personal computer spreadsheets and vertical agricultural programs are easier niches for IBM to target than complex factory automation programs like material requirements planning, he said, which require support from processing, routing, production, inventory control and purchasing systems.

IBM presently offers only a skeleton of a modern manufacturing system, Fello said. XCS' manufacturing software has two advantages over IBM's, he claimed: It takes up half the space on the mainframe and is easily upgraded, which allows small companies to upgrade with hardware that ranges from networked terminals to IBM's 3084 turnkey system.

IBM's factory automation strategy will use its Personal Computer as a basic building block, Fello predicted. "IBM will corner the market with [its] 370 architecture on single- and multiple-station desktops," he said.

XCS' relationship with Xerox offers the best of all possible worlds, Fello said. The disadvantage to the relationship, however, is XCS' close connection to Xerox Corp.'s copier image, he added.

SUPER

from page 66

Bolt, Beranek and Newman, Inc. (BBN) reported its **BBN Communications Corp.** subsidiary has received a contract for a private wide-area data communications network from **Olivetti, S.P.A.** for their customer **Snam.** Snam is a unit of the ENI Group, Italy's $25 billion energy corporation.

The contract is for packet-switching hardware and software. The network will link terminals in 180 cities throughout Italy with 26 ENI computer centers.

■

VLSI Technology, Inc. (VTI) and **Lattice Semiconductor Corp.** jointly announced the signing of a technology and product cross-licensing agreement.

Under the agreement, VTI will receive alternate sourcing rights for very high-performance, electronically erasable programmable read-only memories, static random-access memories and programmable logic devices in development by Lattice.

In exchange, VTI will provide Lattice with wafer fabrication, assembly and test capacity, product engineering and equipment leasing support. Both companies will support joint product development and future product cross-licensing.

■

Matsushita Electric Corp. of America has named Stephen S. Ingersoll, former U.S. ambassador to Japan, as the chairman of a new $10 million foundation to promote education in the U.S.

The foundation will rank in the top 25% of U.S. corporate foundations, according to the "Foundation Directory," and is the largest foundation established by a Japanese company in the U.S.

■

Philon, Inc. has acquired rights to a data base management system developed by the California-based **MAG Software, Inc.** This agreement also includes the development of proprietary enhancements for future Philon product offerings.

■

National Intergroup, Inc. announced that it has formed a wholly owned information services subsidiary named Genix. Genix will offer software sales, computer consulting services and remote computer services from National Intergroup's modern computer data center in Pittsburgh.

The subsidiary will be operated by Raul Pupo, president; Joseph Murphy, vice-president of operations and technology; and John Kelly, vice-president of finance.

■

Verbex, a division of Exxon Corp., and **Lear Siegler, Inc.'s** instrument division announced that they have signed a license agreement that transfers Verbex's continuous speech recognition technology to Lear Siegler.

Under the terms of the agreement, Lear Siegler has access to Verbex's Model 3000 proprietary continuous speech recognition technology. Lear Siegler's license permits it to use the Verbex technology to supplement its extensive development in voice recognition products for military and commercial aircraft instrument/avionics systems as well as military land and amphibious vehicle controls.

■

The **Paxnet** local-area network software system, introduced last year by **Phoenix Software Associates, Ltd.,** has been sold to **Vianetix, Inc.** of Boulder, Colo. Vianetix will market the software under the name Vianet.

■

Scientific Micro Systems, Inc. (SMS) has announced a second-source agreement with **Data Technology Corp.** (DTC). The agreement licenses DTC to manufacture and sell the SMS Omti Series 5000 and Series 6000 SCSI controller boards and to purchase and resell the SMS Omti Series 5000 controller chip sets.

■

NEC Telephones, Inc. and **Compath National** announced the signing of a two-year agreement in which Compath has been awarded nationwide distribution rights to market the Neax 2400 information management systems product line.

■

Micronix Corp. announced it has signed a patent cross-licensing agreement with AT&T.

The agreement states that Micronix and AT&T may each use present and certain future patents relating to lithographic manufacturing equipment. It includes patents developed by AT&T and Micronix for implementing x-ray lithography.

IN THIS CASE, BEING CALLED A HEAVYWEIGHT IS NO COMPLIMENT.

In the left corner, the IBM* 3180. Weighing in at 48 pounds with a footprint of nearly three square feet, it's a true heavyweight.

In the right corner, the CIE-7800. Weighing in at just 26 pounds with a footprint of under two square feet, it's an unabashed lightweight.

The IBM 3180 weighs nearly two times more than the CIE-7800, and takes up 60% more desk space.

Yet the CIE-7800 gives you the same screen formats as the IBM. And here's the knockout punch: the CIE-7800 even costs less.

The CIE-7800 has the edge in personality, too. With the IBM 3180, you get IBM 3270. But the more versatile CIE-7800 can give you IBM 3270, plus DEC VT100,* HP 2622A or IBM 3275/3276-2. With the touch of a key, you can alternate between personalities.

The IBM 3180 only allows one use, too. If it's set up for data entry, all you get is data entry.

But the CIE-7800's "soft" reconfigurable keyboard lets you adapt the terminal for data entry, for use as a typewriter, even for APL applications. You can easily move 7800s from department to department.

And when it comes to printing, the 7800's screen printer port lets you stay put at your workstation instead of making a run for hard copy.

So remember, when you're weighing the alternatives between terminals, you're better off with a lightweight.

POSITION ANNOUNCEMENTS

SOFTWARE PRODUCTS

ARE YOU A GOOD ASSEMBLER PROGRAMMER?

DO YOU WANT TO LEARN MORE "STATE-OF-THE-ART" PROGRAMMING TECHNIQUES AND LEARN HOW SYSTEMS REALLY WORK?

In 1973, **Compuware** was just an idea, a dozen employees and $300,000 in revenues. Today, we have grown to over 600 permanent salaried employees and have revenues in excess of $45 million. **Compuware** is dedicated to researching, developing and marketing innovative data processing products and services. We offer custom programming design, analysis and support and on-site training for established users of mainframe, personal and minicomputers.

Compuware develops software products for the IBM mainframe market. Our internationally known award winning products, **Abend-AID** and **File-AID** have over 2500 users worldwide.

Our environment will provide you with a unique opportunity to **DEVELOP, MAINTAIN, SUPPORT AND DISTRIBUTE** your code to our users. We are not the normal data processing shop! Our products run on the most current releases of IBM's operating systems. Our products must also run on VS1 and older DOS releases. Can you step up to the challenge of writing code that will run on this variety of environments? Do you have the foresight to program for the unforeseen changes to operating systems and environments?

Some of our programmers are Systems Programmers that decided that they wanted to create the software that they always wanted. Others are good Assembler Programmers that wanted to learn more about systems. These programmers found a home. Our Technical Development and Support Group personnel enjoy what they are doing.

Due to expansion within our division, we have immediate opportunities available in the following areas:

PRODUCT DEVELOPERS

The Product Developers are the backbone of the Technical Development and Support Department. Their expertise is relied on for new product development and product maintenance. We are currently looking for Product Developers to work on our **CICS, IMS-DC, and File-AID** products. The qualifications for these positions are:

- **CICS** - This individual will assist the CICS team to develop new enhancements to our current products and maintain these systems. A thorough understanding of CICS is necessary.
- **IMS-DC/VTAM** - This person will provide our group with the expertise in VTAM or IMS-DC to bring a new product to market.
- **File-AID** - This individual will contribute to the File-AID team by assisting them to develop and maintain the File-AID product line. A good understanding of OS and MVS systems, data management and file systems is necessary along with a thorough comprehension of ISPF/PDF.

PRODUCT SPECIALISTS

The Product Specialist is the sales/technical interface of the Products Division. Their primary responsibility is to provide the sales staff with the tools that are necessary to sell our products and to provide our customers with the training and support they need to use our products. Indepth knowledge of programming environments and our products is essential. Specific areas of concentration are:

- **DOS** - Our involvement in the DOS marketplace is always increasing. Due to this expansion, we require an individual that understands the DOS environment to assist our sales staff and development team market our products and further improve our presence in the marketplace.
- **File-AID** - This product has expanded so rapidly that we need to add another Product Specialist to our staff. This individual will possess excellent presentation skills and a thorough knowledge of ISPF/PDF.

PRODUCT SUPPORT REPRESENTATIVES

The Product Support Representative's purpose is to supply the highest level of professional and technical assistance to **Compuware**'s customers and sales staff. Specific areas of expertise that we are looking for include:

- **CICS** - This individual will assist our team to support our customers and sales staff in the use of our CICS product line.
- **GENERAL SYSTEMS** - This individual will provide support to our customers in a variety of areas. We are looking for an individual with a good systems background.

SERVICES DIVISION

We have immediate requirements for individuals to work at various branch locations across the country. These are permanent salaried positions on long term projects. The requirements are as follows:

- **IDMS with ADS/O**
  - — Programmer/Analysts for installations and conversions
  - — Data Base Analysts for logical data base design
- **PROGRAMMER/ANALYSTS** - Two or more years' experience with **CICS, DL-1** utilizing **COBOL** or **PL-1.**
- **PROGRAMMER/ANALYSTS** - Experienced on **VAX VMS** or **PDP RSX-11M** utilizing **FORTRAN** to work in Chesapeake Bay area. Process Control or Yourdon experience a plus.

If you're seeking greater challenges than your current position allows, you'll enjoy **Compuware**'s diverse, excitingly innovative and highly advanced projects. Your efforts will be recognized and rewarded with a salary commensurate with experience, comprehensive benefit package, incentive bonuses and a unique career advancement program for dp technicians. And, you'll enhance your skills with our proven in-house training program. You may send your resume in confidence or call weekdays from 9 a.m. to 5 p.m.:

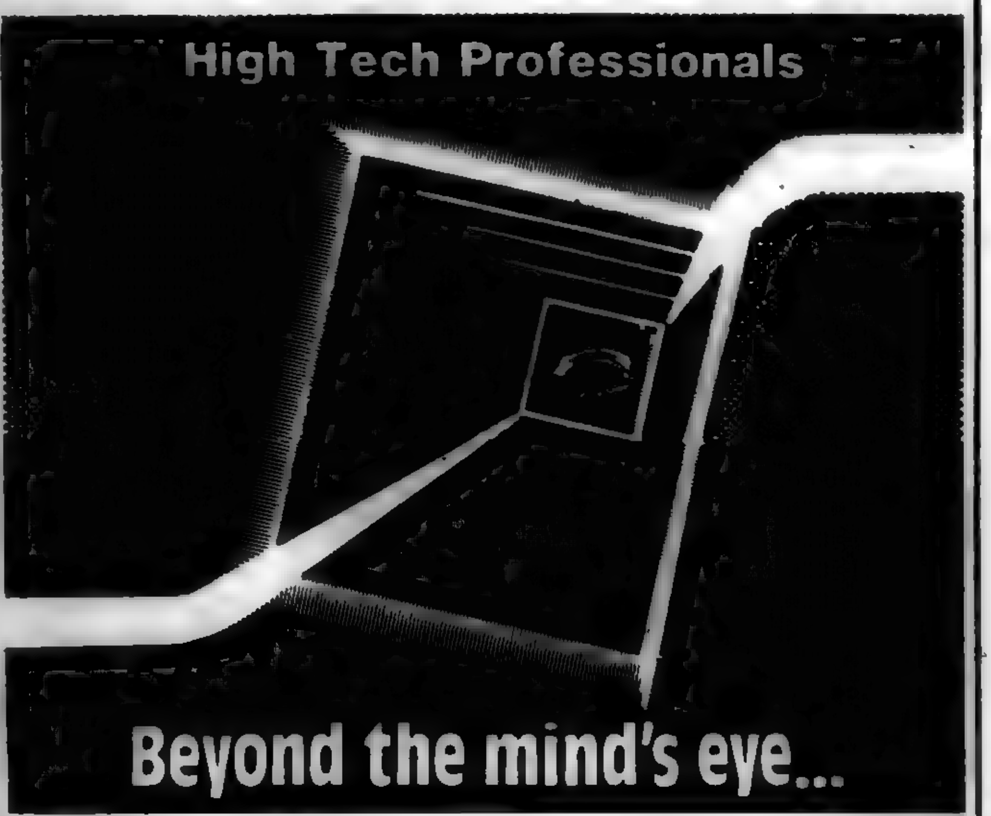
High Tech Professionals



Beyond the mind's eye...

The best technology in the business. Absolutely nothing is more important to an ambitious High Tech professional than having the most complete, state-of-the-art systems support possible…because when your environment looks to the future, your imagination is free to take you there.

Our MVS/XA shop will offer you the latest software, including Omegamon CICS, Omegamon MVS, IMS/DB, SMP, ACF/VTAM and CICS 1.6.1, along with a brand new 31,000 sq. ft. computer facility with everything you need to fire up your creative edge.

Technical Services:

NCC Manager

5 years Network Control experience in a large mainframe environment. Should be familiar with SDLC/BSC protocols, CICS, NCCF, VTAM/NCP, NPDA, NTO, INFO/MGT, 3270 family of terminals and DECNET. Should have end user rapport and proven organizational skills. Will manage a minimum of 10 people. The anticipated network expansion will provide a seasoned manager with the opportunity to build a Network Control Center of the future.

CICS Systems Programmer

Successful candidate will be well versed in all aspects of CICS, SMP and MVS operating systems. Experience with BTAM and/or VTAM, plus good oral and written skills desired.

MVS Systems Programmer

Experience with MVS/SP or MVS/XA operating systems in a large environment required, as well as JES 2, TSO, MVS/EXITS and SMP. Software package installation/maintenance with IBM and OEM products experience also desired. Knowledge of 308X processors, 3350, 3380 DASD is beneficial. Finally, a proven ability to perform problem diagnosis and read dumps is necessary, as is user support experience.

Applications:

Senior Systems Analysts

For an Automated Claims System, we seek individuals with IMS/DB expertise. Successful candidates will design and coordinate technical activities for major CICS IMS/DB projects.

Senior Programmer Analyst

Individual to aid in developing an on-line CICS Automated Brokerage system which utilizes CICS command level COBOL and VSAM file structures. We seek CICS command level expertise. 10% travel required (Atlanta & San Francisco).

Programmer Analysts

We seek several IBM OS COBOL professionals to work on large insurance and financial systems in both batch and on-line environments. CICS command level experience necessary for on-line projects.

If you're the kind of High Tech professional who looks beyond the mind's eye to tomorrow's innovations, come to —Crum & Forster.

For a preliminary screening, call us at (201) 285-7110

Or forward your resume for immediate consideration to: Personnel Manager, Dept. CW 12, Crum & Forster Corporation, 305 Madison Avenue, Morristown, New Jersey 07960. An equal opportunity employer m/f/h/v.

SOFTWARE PROFESSIONALS

ROCHESTER GAS & ELECTRIC is a major investor-owned utility serving western New York State. We are located in the heart of New York State's wine country and vast apple orchards. Here, we enjoy endless recreational activities on the shores of Lake Ontario and in the nearby Finger Lakes region.

Our data processing environment consists of multiple IBM and Data General processors and is expanding rapidly. With the recent installation of our IBM 3083 running MVS/XA, JES2, CICS, ADABAS, TSO/E, ISPF, ACF2, UCC1, and UCC7/11, and with all new peripherals including IBM 3725s, 3380s, and very shortly, IBM 3480 tape drives, RG&E is committed to the future.

To help us shape this bright future, we are currently looking for:

- **LEAD COMMUNICATIONS SYSTEMS PROGRAMMER**

To lead a staff of four in support of all telecommunications hardware and software systems. A strong background in ACF/VTAM, ACF/NCP, and CICS is required as is experience in the design and implementation of multi-vendor, multi-host networks. Experience in integrating ASCII terminals into the network is preferred along with a working knowledge of NCCF and NPDA.

- **MVS SYSTEMS PROGRAMMER**

To become involved in building and maintaining a state-of-the-art MVS/XA environment. Initially to design and implement a comprehensive DASD management methodology, install program products, and develop user exits. This position could grow into a senior systems programming position with responsibilities for major operating system components. Candidates should have experience with DASD management, VSAM, assembler language programming, and installing program products using SMP.

At RG&E we believe in our commitment to excellence and are dedicated to providing the ongoing technical training necessary to ensure this excellence.

We offer excellent starting salary, benefits, and relocation package. Please send your resume to:

AN EQUAL OPPORTUNITY EMPLOYER

CHRISTIAN BROTHERS COLLEGE

DIRECTOR OF THE TELECOMMUNICATIONS INSTITUTE

February 1985 is the official date for the commencement of Christian Brothers College's new Telecommunications Institute. The Institute is a planned educational division of the college, formed in partnership with local and national businesses in the tele- and datacommunications related fields. Endowed funding for the institute has been provided by these businesses and industries. The Director, responsible to the Vice-President for Academic Affairs, serves as the executive officer for the Institute, and is responsible for the following areas: advancement and promotion of the Institute's services to local and national businesses (including continuing education programs); planning in coordinating the college's undergraduate and future graduate programs in these fields; chairmanship of the Institute's Advisory Board; and, consultant to and college liaison with local businesses.

Christian Brothers College, founded in 1871, is the oldest private, Catholic college in the Mid-South, whose educational programs encompass engineering, business, the arts, and sciences.

Candidates for the position should possess: a minimum of ten years experience (or related industry experience) in systems planning in an area of satellite, telephone, radio, fiber optics, or computer communications; excellent management and human relations skills. Preferred qualifications: advanced degree(s) in business or engineering and experience in higher education. Salary and benefits competitive.

Application deadline is December 15, 1984. Send resume to:

Brother Anthony Pisano, FSC, Ph.D.
Vice-President for Academic Affairs
Christian Brothers College
650 East Parkway South

TANDEM® Data Communications Expert
Needed For Processing
BURROUGHS SYSTEM ENHANCEMENTS

Through a solid commitment to ongoing expansion and innovation, BANK OF VIRGINIA moved from 4th to 3rd largest bank in Virginia — and we continue to remove barriers to product excellence and flexibility. The user-oriented professionals who design and implement the computer modifications essential for growth are the primary forces behind our success.

We invite you to join this elite team and participate in data communications and authorizations functions, to include: TANDEM SOFTWARE/HARDWARE PLANNING, LINE LOAD EVALUATION & RESOLUTION, and TEST & IMPLEMENTATION OF TANDEM SYSTEM RELEASES. You will participate in and direct the development, implementation, and/or revision of the authorization functions.

To qualify, candidates should have Tandem Net, Tandem systems software experience, and the ability to implement patches or any changes involving communications protocols.

Investigate this opportunity with Bank of Virginia; our better offer will be sweetened with an environment that lends itself to advancement. In Richmond, you will be located near prime Atlantic Coast vacation spots, major historic attractions, and universities. For additional information and immediate consideration, please forward your resume in confidence to: Management Recruitment Officer, BANK OF VIRGINIA, Operations Center, P.O. Box 25339, Richmond, VA 23260 or telephone (804) 747-2687. An equal opportunity employer M/F/H.

Expanding the horizons of banking
Bank of Virginia

SR. PROGRAMMING SPECIALIST

An opening exists for a seasoned professional who is a self-starter and who enjoys *programming* state-of-the-art systems.

Reporting to the Director of MIS, Power Conversion Group, responsibilities will entail the programming of systems that will address the needs of management at both the plant and Group level.

Specific applications at the plant level entail the bar-coding of ASK manufacturing software modules, and the development of both CAM and micro-computer applications geared to improve user productivity. Experience on the HP-3000 with a command of Fortran, and a working knowledge of Cobol is required.

Specific applications at the Group level entail programming micro-computer applications relative to the Marketing, Sales and Financial areas, and the transferring of data from/to the HP-3000. A working knowledge of micro-computer software (dBase II Wordstar, etc) is preferred but not required.

The ideal candidate will have a B.S. in Computer Science plus 10 years experience.

The Power Conversion Group is a dynamic organization which offers rich rewards to top performers. For immediate consideration send resume to David Swent.

For Recruitment Advertising--

Computerworld is far more cost efficient than other newspapers.

Most people who read COMPUTERWORLD aren't computer people; and most computer people don't read any one newspaper. No U.S. newspaper reaches more than 121,500 Data Processing people, even by the most generous estimates. *Computerworld*, on the other hand, is read by an estimated 344,300 professional DP/MIS people each week in the U.S.

To place your ad, or to get a 1984 rate card with complete details on Computerworld Classified Advertising, call or write:

Computerworld Classified Advertising
P.O. Box 880, 375 Cochituate Road
Framingham, MA 01701
(617) 879-0700; (800) 343-6474

ALLIED Medical Group are leading British health care consultants to the large and prestigious Riyadh Al Kharj Hospital Programme.

The multi-machine installation that serves the Programme is remarkably sophisticated, with a network supporting a mixture of on-line and batch systems for accounting, patient and management information, laboratory engineering and administrative applications.

The hardware consists of an array of kit from top manufacturers — a Honeywell L66/10, 3 × HP 3000 (soon to include a Series 48) and a CDC CYBER 18/20. Software used includes IDS1, TDS, GCOS3, GMAP, IMAGE, VIEW, COBOL, FORTRAN and SPL.

The Programme is in the midst of preparing a long range computer strategy, which will involve a major expansion of the network and significant restructuring and expansion of the application systems. To play a significant role in this process, we are now urgently seeking two high calibre professionals to join the team:

Develop the long-range systems strategy for one of Saudi Arabia's leading hospitals

Systems and Programming Manager

$44,900

Reporting to the Director of Computer Services, you'll be expected to play a leading role in the development and implementation of the long-term computing strategy as well as being responsible for the support of existing systems.

We need a graduate, aged 35+, with at least 10 years experience — including either 3 years as a Systems and Programming Manager, or 5 years project management experience. Extensive health care experience in a large hospital environment, including systems implementation and experience in the preparation of strategic plans, are essentials. Membership of a data processing and/or health care professional organisation would be an advantage.
Quote Ref: P/RKH/3055/CW.

Systems Software Specialist

$36,300

Your task would be twofold — to modify and maintain highly complex OS and support software; to incorporate the latest engineering releases and utilities from a number of manufacturers; and to be responsible for applications which impact on the overall operating system, such as file maintenance routines, telecomms software and mathematics and scientific software packages.

You'll need a first degree or equivalent in Computer Science or Math and your experience of at least four years in the computing industry must include one year of direct responsibility for manufacturers' OS software.
Quote Ref: P/RKH/3039/CW.

The salaries quoted for these married status, two year contract basis posts (based on approximately 3.55 SR — $1) include a gratuity of one month's salary for every twelve months satisfactory service — payable at the end of your two year contract.

The comprehensive benefits package, includes: free, fully furnished accommodation; four weeks leave for every six months service; free air fares (including leave flights) and extensive welfare and recreation facilities.

For further details please write enclosing a full career resume to: Theresa Sutherland, Senior Personnel Officer, Allied Medical Group, 12/18 Grosvenor Gardens, London, SW1W 0DZ, England. Please quote the appropriate reference number on all correspondence.

Allied Medical Group

EDP AUDITOR

San Diego Gas & Electric is seeking an experienced EDP Auditor for its Corporate Internal Auditing Department. Candidates should have:

- Minimum 2 years of EDP audit experience;
- Experience with IDMS;
- Understanding of Audit and Data Processing Philosophies and knowledge of computer hardware and software;
- BS degree required and certificate as a CDP, CISA or CIA desirable;
- Excellent oral and written communication skills.

Please submit resume to:

ENGINEERING - Assistant to Dean Engineering Computing. Position carries responsibility for the operational status of the computing system; assist faculty with the development of computer programs for educational and research applications, provides faculty with information related to computer software and hardware availability, and advises on such acquisitions in liaison with computer services. Additional duties include scheduling usage of the computing system, coordinating engineering college computing needs with the university computer services department. Minimum qualifications: PhD degree in Engineering or related area, strong background in minicomputer operations and engineering applications programming. Preferred qualifications: operating systems experience; real-time computing experience; college level teaching experience. Send resume and reference information to: Anthony B. [illegible], Dean, College of Engineering, CLEVELAND STATE UNIVERSITY, 1983 E. 24th Street, Cleveland, Ohio 44115. An equal opportunity employer, m/f/h.

Gold Circle

MANAGER, INFORMATION SYSTEMS

GOLD CIRCLE, the progressive, $800 million division of the multi-billion dollar Federated Department Stores, boasts one of the Midwest's most technologically advanced IBM shops — serving our 51-store, 4-state retail network. Our stimulating environment incorporates an IBM 3081 mainframe, MVS-SP operating systems, and a variety of innovative projects and challenges. We're currently seeking two results-oriented managers who will oversee and direct activities of Project Managers and their teams as they develop financial or point-of-sale and merchandising support systems.

These positions require a thorough working knowledge of large scale IBM mainframes, COBOL programming, structured life cycle development methodology, and applications development. The successful candidates will have a related college degree or equivalent work experience; excellent leadership, planning and communication skills; and preferably, exposure to an OS environment. Experience with IMS data base management and prior experience in the supervision of project managers would be helpful.

MANAGER, FINANCIAL SYSTEMS

Experience in the development of accounts payable systems, personnel-payroll systems and general ledger systems is required. Exposure to automated invoice match and accounts receivable systems as well as MSA packages would be considered a plus.

MANAGER, POINT-OF-SALE & MERCHANDISING SUPPORT SYSTEMS

Experience in the development of inventory management and sales capture and reporting systems is required. Knowledge of point-of-sale and merchandising systems as well as a background in applications development in a retail or manufacturing operation would be helpful.

To learn more about the Gold Circle challenge, our progressive compensation program that includes an excellent relocation package, and the exciting, affordable life-style in a new era of growth for Columbus — our state's largest city, CALL Julie Smith COLLECT at (614) [illegible] or send your resume in confidence to: GOLD CIRCLE STORES, Executive Placement, Dept. T, P.O. Box 63, Worthington, Ohio 43085.

DATA PROCESSING PROFESSIONALS
Overseas Positions

Put yourself on a technical fast track with these unique opportunities available as a result of continued expansion and an industry position of technical leadership. You will participate as a key team member in the development of this state-of-the-art Data Center.

SYSTEM PROGRAMMER - $60,000. Principal activities will include operating system conversion and modifications, performance tuning and system programmer training, in this MVS-JES-2 operation. Additional responsibilities will be sysgens and problem determination. MVS/XA experience helpful.

CAPACITY PLANNER - $55,000. Responsibility will be workload forecasting, impact analysis, hardware planning and Usage/Service reporting. Candidate should have knowledge of Best/I, SAS, and MICS. This highly visible position offers an excellent opportunity for increases in responsibility.

NETWORK SYSTEM PROGRAMMER - $60,000. Responsible for network software including problem determination, planning, training of software staff, and network operators. You will utilize TSO, ISPF, ALC, VTAM, NCP, SNA/SDLC, and be responsible for 3705 GENS. VCNA and RSCS experience will increase your upward mobility.

DASD MANAGEMENT ANALYST - $60,000. Join a key management team and define advanced policy and procedures. The ability to articulate "hands-on" knowledge of Mass Storage Systems, HISAM, SAS, and TSO/ISPF is a key element of this position. A knowledge of ISAM II and ACF-2 is a plus.

SOFTWARE ANALYST - $55,000. Responsibilities will include strategic planning, office automation evaluation, analysis of user requirements, preparation of feasibility reports, system justifications and implementation planning. Candidate should have knowledge of Wang & IBM product lines.

SYSTEM COORDINATOR - $60,000. Responsible for system implementation strategies in this major IBM/IMS installation. Use your broad based knowledge of system technologies, project management, and staff training procedures for this challenging and rewarding position.

Compensation consists of a base salary plus approximately 40% expatriate premium and an overseas cost differential. Candidates interested in additional information should call (713) 629-6681 or send resume to:

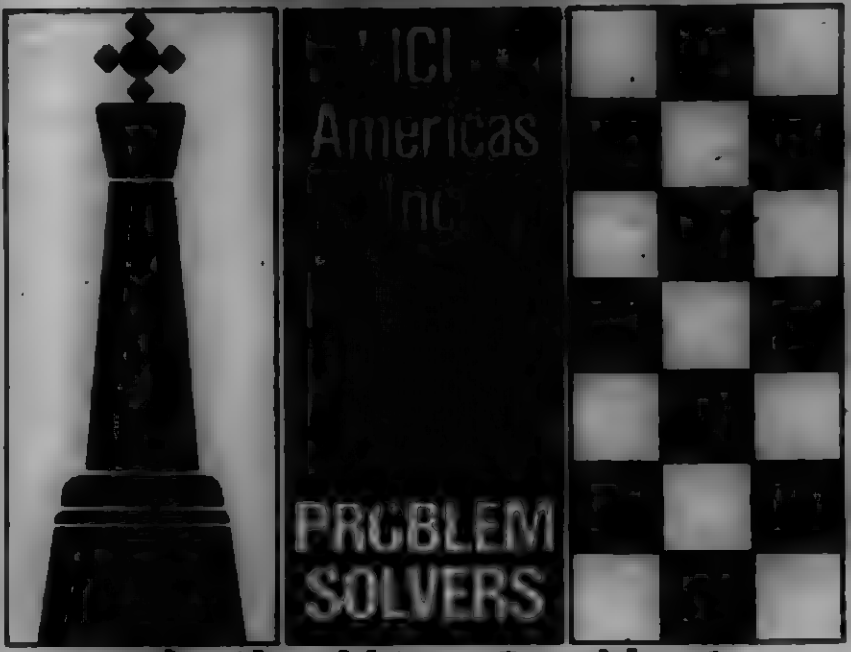
ATTENTION BUSINESS & SCIENTIFIC MIS PROFESSIONALS



Why Should You Consider A Career With ICI Americas?

Challenge/Recognition/Career Growth

These are just a few of the many advantages of working for ICI Americas (1983 sales exceeded $1 billion), the U.S. subsidiary of a major multi-national corporation. If you would like non-routine assignments, creative problem solving, and the opportunity of working with top-notch professionals on meaningful projects, we would like to hear from you. Due to our rapid growth, several new positions have been added to our dynamic corporate MIS Department. These positions support all major business functions including manufacturing, marketing, finance, and R&D throughout the Company.

Sr. Business System Analyst — 5+ years experience including project responsibility for implementation of manufacturing, financial or marketing systems in a large IBM mainframe environment. Experience in MRP II, DRP, Quality Control, or Automated Warehousing is a plus.

Sr. Scientific Analysts — The positions require individuals with 3 to 5 years of experience in one of more of the following: development of structure activity relationships, computational chemistry, chemical graphics, applied statistics, chemical data management, instrument interfacing and laboratory information systems. An advanced degree in the physical sciences, and VAX/VMS experience are preferred. FORTRAN experience is essential, as well as strong verbal and written communications skills.

Programmers/Analysts — Excellent advancement opportunities for people with 2+ years in OS/MVS, COBOL, TSO/SPF or DOS/VSE and CICS/DLI in programming complex business, financial and marketing systems.

Data Base Analyst — 3 or more years data processing experience with a working knowledge of IMS DB/DC and either COBOL or assembler, as well as IMS backup/recovery utilities.

Operations Research Analyst — BS in OR or Business, Industrial Engineering with major in OR, MS or MBA preferred. Minimum three years of experience in applying OR techniques such as LP, Forecasting, Econometrics, Financial Modeling, Simulation, Statistic or Decision Analysis. Experience using FORTRAN, SAS and Financial Model languages (FCS, 1-2-3) a definite plus; looking for results-oriented individual.

OS/MVS Systems Programmer — 3-5 years of solid MVS operating system support experience, including system generation, maintenance (SMP4) and program product installation. A good knowledge of TSO, ISPF, ACF/VTAM and SAS is preferred with exposure to either IMS/VS or CICS/VS a definite plus.

Information Center Positions — Mature IC has positions for Personal Computer Programmer Analyst and Time-sharing Technical Consultant (project leader). Experience required in fourth generation languages (SAS, FCS, INQUIRE) and PC software (BASIC, C, 1-2-3 or PASCAL). Both positions involve hardware and software evaluations and user support.

These positions are located at our corporate headquarters, a campus-like complex in suburban Wilmington, DE. ICI offers salaries fully commensurate with the required experience, excellent benefits including a generous relocation policy and ample growth opportunities. Delaware, "the small wonder" state, offers cosmopolitan living without the high costs and other drawbacks of big city living. Why not invest 20 cents in your future by sending your resume including salary requirement, in confidence to: **James H. Kline, Dept. CW-19, ICI Americas Inc., Wilmington, Delaware 19897.** *An Equal Opportunity Employer M/F*

We're Hiring Data Processing Professionals

Central and South West is a two plus billion dollar electric utility holding company offering competitive salaries, excellent benefits and stable working conditions. Our Information Services Department, as host center, provides services in a multi-company environment.

Our primary system software is MVS/SP1 with JES2. Additionally we use TSO/SPF, COBOL ROSCOE, and Command Level CICS. Our data base is IDMS. We were recently chosen to be one of Cullinet's beta sites for their new development software! We use Cullinet's 4th generation languages—ADS/O, OLM, CULPRIT, etc.

Each of our current openings needs people with proven analytical skills and user interface experience in addition to technical knowledge and abilities.

If we're the type of company you are seeking, and your experience is from a similar environment, please send your resume and salary requirements to the Employee Relations Department. Principals only.

Programmer/Analyst
(Business Applications)
Typical project assignments include construction project management, land management system, corporate shareholder system, etc.
Will provide technical expertise in system design, problem determination and system maintenance efforts. Should have JCL skills and online experience (CICS, VSAM) plus exposure to data base concepts.

Sr. Programmer/Analyst
(Engineering Applications)
Multi-project assignments offering multi-company exposure will include CAD/CAM, VM/CMS, transmission design, etc.
Will provide scientific/engineering expertise in system design and implementation efforts. Should have prior scientific/engineering application experience plus IDMS experience.

Programmer/Analyst
(Engineering Applications)
Initial assignment to the mining information management project will result in the development of a total, stand-alone system using state-of-the-art technology.
Will provide online and data base technical expertise in system design and problem determination efforts. Should have related technical skills developed from manufacturing related assignments. IDMS, ADS/O experience important.

An Equal Opportunity Employer

Programmer/Analyst
Put your problem solving skills to work for a leader in information technology.

Harris, a Fortune 200 corporation with sales of $2 billion, is a fast-growing company in advanced communication and information processing. We have an immediate requirement at our corporate headquarters for a Programmer/Analyst. This individual should be highly motivated and possess excellent problem solving skills.

In this key position, you will design, program and implement applications using high level languages (SAS, FOCUS and IFPS) on both the Harris 800 and the IBM3081. You will also be responsible for the maintenance and modification of existing COBOL applications.

To qualify, you should have a Bachelor's degree, preferably in Computer Science with a minor in Accounting or Business. 2-3 years' relevant experience in finance applications, and experience with IBM PC/microcomputers would be a plus. Experience with FOCUS and/or IFPS is a must.

Harris offers a competitive salary and benefits program. Please forward your resume including salary requirements to: Corporate Staffing, Harris Corporation, Dept. CW, Melbourne, Florida 32919.

We are an equal opportunity employer M/F/H/V
